THE COLLECTED WORKS OF

C. G. JUNG

THE PUBLICATION of the first complete edition, in English, of the works of C. G. Jung was undertaken by Routledge and Kegan Paul, Ltd., in England and by Bollingen Foundation in the United States. The American edition is number XX in Bollingen Series, which since 1967 has been published by Princeton University Press. The edition contains revised versions of works previously published, such as *Psychology of the Unconscious*, which is now entitled *Symbols of Transformation*; works originally written in English, such as *Psychology and Religion*; works not previously translated, such as *Aion*; and, in general, new translations of virtually all of Professor Jung's writings. Prior to his death, in 1961, the author supervised the textual revision, which in some cases is extensive. Sir Herbert Read (d. 1968), Dr. Michael Fordham, and Dr. Gerhard Adler compose the Editorial Committee; the translator is R. F. C. Hull (except for Volume 2) and William McGuire is executive editor.

The price of the volumes varies according to size; they are sold separately, and may also be obtained on standing order. Several of the volumes are extensively illustrated. Each volume contains an index and in most a bibliography; the final volumes will contain a complete bibliography of Professor Jung's writings and a general index to the entire edition.

In the following list, dates of original publication are given in parentheses (of original composition, in brackets). Multiple dates indicate revisions.

*1. PSYCHIATRIC STUDIES

On the Psychology and Pathology of So-Called Occult Phenomena (1902)

On Hysterical Misreading (1904)

Cryptomnesia (1905)

On Manic Mood Disorder (1903)

A Case of Hysterical Stupor in a Prisoner in Detention (1902)

On Simulated Insanity (1903)

A Medical Opinion on a Case of Simulated Insanity (1904)

A Third and Final Opinion on Two Contradictory Psychiatric Diagnoses
(1906)

On the Psychological Diagnosis of Facts (1905)

†2. EXPERIMENTAL RESEARCHES

Translated by Leopold Stein in collaboration with Diana Riviere

STUDIES IN WORD ASSOCIATION (1904–7, 1910)

The Associations of Normal Subjects (by Jung and F. Riklin)

An Analysis of the Associations of an Epileptic

The Reaction-Time Ratio in the Association Experiment

Experimental Observations on the Faculty of Memory

Psychoanalysis and Association Experiments

The Psychological Diagnosis of Evidence

Association, Dream, and Hysterical Symptom

The Psychopathological Significance of the Association Experiment

Disturbances in Reproduction in the Association Experiment

The Association Method

The Family Constellation

PSYCHOPHYSICAL RESEARCHES (1907–8)

On the Psychophysical Relations of the Association Experiment

Psychophysical Investigations with the Galvanometer and Pneumograph in
Normal and Insane Individuals (by F. Peterson and Jung)

Further Investigations on the Galvanic Phenomenon and Respiration in
Normal and Insane Individuals (by C. Ricksher and Jung)

Appendix: Statistical Details of Enlistment (1906); New Aspects of Criminal
Psychology (1908); The Psychological Methods of Investigation Used in the
Psychiatric Clinic of the University of Zurich (1910); On the Doctrine of
Complexes ([1911] 1913); On the Psychological Diagnosis of Evidence
(1937)

*3. THE PSYCHOGENESIS OF MENTAL DISEASE

The Psychology of Dementia Praecox (1907)

The Content of the Psychoses (1908/1914)

On Psychological Understanding (1914)

A Criticism of Bleuler's Theory of Schizophrenic Negativism (1911)

On the Importance of the Unconscious in Psychopathology (1914)

On the Problem of Psychogenesis in Mental Disease (1919)

Mental Disease and the Psyche (1928)

On the Psychogenesis of Schizophrenia (1939)

Recent Thoughts on Schizophrenia (1957)

Schizophrenia (1958)

†4. FREUD AND PSYCHOANALYSIS

Freud's Theory of Hysteria: A Reply to Aschaffenburg (1906)

The Freudian Theory of Hysteria (1908)

The Analysis of Dreams (1909)

A Contribution to the Psychology of Rumour (1910–11)

On the Significance of Number Dreams (1910–11)

Morton Prince, "The Mechanism and Interpretation of Dreams": A Critical Review (1911)

On the Criticism of Psychoanalysis (1910)

Concerning Psychoanalysis (1912)

The Theory of Psychoanalysis (1913)

General Aspects of Psychoanalysis (1913)

Psychoanalysis and Neurosis (1916)

Some Crucial Points in Psychoanalysis: A Correspondence between Dr. Jung and Dr. Loÿ (1914)

Prefaces to "Collected Papers on Analytical Psychology" (1916, 1917)

The Significance of the Father in the Destiny of the Individual (1909/1949)

Introduction to Kranefeldt's "Secret Ways of the Mind" (1930)

Freud and Jung: Contrasts (1929)

‡5. SYMBOLS OF TRANSFORMATION (1911–12/1952)

PART I

Introduction

Two Kinds of Thinking

The Miller Fantasies: Anamnesis

The Hymn of Creation

The Song of the Moth

PART II

Introduction

The Concept of Libido

The Transformation of Libido

The Origin of the Hero

Symbols of the Mother and of Rebirth

The Battle for Deliverance from the Mother

The Dual Mother

The Sacrifice

Epilogue

Appendix: The Miller Fantasies

*6. PSYCHOLOGICAL TYPES (1921)

Introduction

The Problem of Types in the History of Classical and Medieval Thought

Schiller's Ideas on the Type Problem

The Apollinian and the Dionysian

The Type Problem in Human Character

The Type Problem in Poetry

The Type Problem in Psychopathology

The Type Problem in Aesthetics

The Type Problem in Modern Philosophy

The Type Problem in Biography

General Description of the Types

Definitions

Epilogue

Four Papers on Psychological Typology (1913, 1925, 1931, 1936)

†7. TWO ESSAYS ON ANALYTICAL PSYCHOLOGY

On the Psychology of the Unconscious (1917/1926/1943)

The Relations between the Ego and the Unconscious (1928)

Appendix: New Paths in Psychology (1912); The Structure of the Unconscious (1916) (new versions, with variants, 1966)

‡8. THE STRUCTURE AND DYNAMICS OF THE PSYCHE

On Psychic Energy (1928)

The Transcendent Function ([1916]/1957)

A Review of the Complex Theory (1934)

The Significance of Constitution and Heredity in Psychology (1929)

Psychological Factors Determining Human Behavior (1937)

Instinct and the Unconscious (1919)

The Structure of the Psyche (1927/1931)

On the Nature of the Psyche (1947/1954)

General Aspects of Dream Psychology (1916/1948)

On the Nature of Dreams (1945/1948)

The Psychological Foundations of Belief in Spirits (1920/1948)

Spirit and Life (1926)

Basic Postulates of Analytical Psychology (1931)
Analytical Psychology and *Weltanschauung* (1928/1931)
The Real and the Surreal (1933)
The Stages of Life (1930–1931)
The Soul and Death (1934)
Synchronicity: An Acausal Connecting Principle (1952)
Appendix: On Synchronicity (1951)

*9. PART I. THE ARCHETYPES AND THE COLLECTIVE UNCONSCIOUS

Archetypes of the Collective Unconscious (1934/1954)
The Concept of the Collective Unconscious (1936)
Concerning the Archetypes, with Special Reference to the Anima Concept
(1936/1954)
Psychological Aspects of the Mother Archetype (1938/1954)
Concerning Rebirth (1940/1950)
The Psychology of the Child Archetype (1940)
The Psychological Aspects of the Kore (1941)
The Phenomenology of the Spirit in Fairytales (1945/1948)
On the Psychology of the Trickster-Figure (1954)
Conscious, Unconscious, and Individuation (1939)
A Study in the Process of Individuation (1934/1950)
Concerning Mandala Symbolism (1950)
Appendix: Mandalas (1955)

*9. PART II. AION (1951)

RESEARCHES INTO THE PHENOMENOLOGY OF THE SELF

The Ego
The Shadow
The Syzygy: Anima and Animus
The Self
Christ, a Symbol of the Self
The Sign of the Fishes
The Prophecies of Nostradamus
The Historical Significance of the Fish
The Ambivalence of the Fish Symbol
The Fish in Alchemy
The Alchemical Interpretation of the Fish

Background to the Psychology of Christian Alchemical Symbolism
Gnostic Symbols of the Self
The Structure and Dynamics of the Self
Conclusion

*10. CIVILIZATION IN TRANSITION

The Role of the Unconscious (1918)
Mind and Earth (1927/1931)
Archaic Man (1931)
The Spiritual Problem of Modern Man (1928/1931)
The Love Problem of a Student (1928)
Woman in Europe (1927)
The Meaning of Psychology for Modern Man (1933/1934)
The State of Psychotherapy Today (1934)
Preface and Epilogue to “Essays on Contemporary Events” (1946)
Wotan (1936)
After the Catastrophe (1945)
The Fight with the Shadow (1946)
The Undiscovered Self (Present and Future) (1957)
Flying Saucers: A Modern Myth (1958)
A Psychological View of Conscience (1958)
Good and Evil in Analytical Psychology (1959)
Introduction to Wolff’s “Studies in Jungian Psychology” (1959)
The Swiss Line in the European Spectrum (1928)
Reviews of Keyserling’s “America Set Free” (1930) and “La Révolution
Mondiale” (1934)
The Complications of American Psychology (1930)
The Dreamlike World of India (1939)
What India Can Teach Us (1939)
Appendix: Documents (1933–1938)

†11 PSYCHOLOGY AND RELIGION: WEST AND EAST

WESTERN RELIGION

Psychology and Religion (The Terry Lectures) (1938/1940)
A Psychological Approach to the Dogma of the Trinity (1942/1948)
Transformation Symbolism in the Mass (1942/1954)

Forewords to White's "God and the Unconscious" and Werblowsky's "Lucifer and Prometheus" (1952)

Brother Klaus (1933)

Psychotherapists or the Clergy (1932)

Psychoanalysis and the Cure of Souls (1928)

Answer to Job (1952)

EASTERN RELIGION

Psychological Commentaries on "The Tibetan Book of the Great Liberation" (1939/1954) and "The Tibetan Book of the Dead" (1935/1953)

Yoga and the West (1936)

Foreword to Suzuki's "Introduction to Zen Buddhism" (1939)

The Psychology of Eastern Meditation (1943)

The Holy Men of India: Introduction to Zimmer's "Der Weg zum Selbst" (1944)

Foreword to the "I Ching" (1950)

*12. PSYCHOLOGY AND ALCHEMY (1944)

Prefatory note to the English Edition ([1951?] added 1967)

Introduction to the Religious and Psychological Problems of Alchemy

Individual Dream Symbolism in Relation to Alchemy (1936)

Religious Ideas in Alchemy (1937)

Epilogue

†13. ALCHEMICAL STUDIES

Commentary on "The Secret of the Golden Flower" (1929)

The Visions of Zosimos (1938/1954)

Paracelsus as a Spiritual Phenomenon (1942)

The Spirit Mercurius (1943/1948)

The Philosophical Tree (1945/1954)

‡14. MYSTERIUM CONIUNCTIONIS (1955–56)

AN INQUIRY INTO THE SEPARATION AND

SYNTHESIS OF PSYCHIC OPPOSITES IN ALCHEMY

The Components of the Coniunctio

The Paradoxa

The Personification of the Opposites

Rex and Regina

Adam and Eve
The Conjunction

*15. THE SPIRIT IN MAN, ART, AND LITERATURE

Paracelsus (1929)

Paracelsus the Physician (1941)

Sigmund Freud in His Historical Setting (1932)

In Memory of Sigmund Freud (1939)

Richard Wilhelm: In Memoriam (1930)

On the Relation of Analytical Psychology to Poetry (1922)

Psychology and Literature (1930/1950)

“Ulysses”: A Monologue (1932)

Picasso (1932)

†16. THE PRACTICE OF PSYCHOTHERAPY

GENERAL PROBLEMS OF PSYCHOTHERAPY

Principles of Practical Psychotherapy (1935)

What Is Psychotherapy? (1935)

Some Aspects of Modern Psychotherapy (1930)

The Aims of Psychotherapy (1931)

Problems of Modern Psychotherapy (1929)

Psychotherapy and a Philosophy of Life (1943)

Medicine and Psychotherapy (1945)

Psychotherapy Today (1945)

Fundamental Questions of Psychotherapy (1951)

SPECIFIC PROBLEMS OF PSYCHOTHERAPY

The Therapeutic Value of Abreaction (1921/1928)

The Practical Use of Dream-Analysis (1934)

The Psychology of the Transference (1946)

Appendix: The Realities of Practical Psychotherapy ([1937] added, 1966)

‡17. THE DEVELOPMENT OF PERSONALITY

Psychic Conflicts in a Child (1910/1946)

Introduction to Wickes’s “Analyses der Kinderseele” (1927/1931)

Child Development and Education (1928)

Analytical Psychology and Education: Three Lectures (1926/1946)

The Gifted Child (1943)

The Significance of the Unconscious in Individual Education (1928)

The Development of Personality (1934)

Marriage as a Psychological Relationship (1925)

18. THE SYMBOLIC LIFE

Miscellaneous Writings

19. GENERAL BIBLIOGRAPHY OF C. G. JUNG'S WRITINGS

20. GENERAL INDEX TO THE COLLECTED WORKS

1 [Delivered as a lecture to the Zurich Medical Society in 1935. Published as “Grundsätzliches zur praktischen Psychotherapie,” *Zentralblatt für Psychotherapie*, VIII (1935): 2, 66–82.—EDITORS.]

1 [Delivered as a lecture, “Was ist Psychotherapie?,” in May 1935. at a symposium on “Psychotherapy in Switzerland.” Subsequently published in *Schweizerische Aerztezeitung fur Standesfragen*, XVI: 26 (June, 1935), 335–39.—EDITORS.]

1 [Written in English. Read at the Congress of the Society of Public Health, Zurich, in 1929. First published in *Journal of State Medicine* (London), XXXVIII: 6 (June, 1930), 348–54.—EDITORS.]

1 [*Delivered as a lecture, “Ziele der Psychotherapie,” on April 12, 1929, at the 4th General Medical Congress for Psychotherapy, Bad Nauheim, and published in the *Bericht* of the Congress, 1929; republished in *Seelenprobleme der Gegenwart* (Zurich, 1931), pp. 87–114. Previously trans. by C. F. Baynes and W. S. Dell in *Modern Man in Search of a Soul* (London and New York, 1933).—EDITORS.]

2 [Published at Leipzig, 1904–13.—EDITORS.]

3 [•The attribution to Coleridge is incorrect, according to Coleridgean scholars who were consulted.—EDITORS.]

4 [Viz., thinking, feeling, sensation, and intuition.—EDITORS.]

5 [•The term “nothing but” (*nichts als*) denotes the common habit of explaining something unknown by reducing it to something apparently known and thereby devaluing it. For instance, when a certain illness is said to be “nothing but psychic,” it is explained as imaginary and is thus devalued. The expression is borrowed from James, *The Varieties of Religious Experience*, p. 12.—EDITORS.]

6 •This has since been remedied. Cf. “A Study in the Process of Individuation.” [Also cf. *Psychology and Alchemy*, Part II.—EDITORS.]

1 [Published as “Die Probleme der modernen Psychotherapie” in *Schweizerisches Medizinisches Jahrbuch*, 1929, and in *Seelenprobleme der Gegenwart* (Zurich, 1931), pp. 1–39. Previously trans. by C. F. Baynes and W. S. Dell in *Modern Man in Search of a Soul* (London and New York, 1933).—EDITORS.]

1 [•The introductory address to a discussion at the Conference for Psychology, Zurich, September 26, 1942. Published as “Psychotherapie und Weltanschauung” in the *Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, I (1943):3, 157–64; and in *Aufsätze zur Zeitgeschichte* (Zurich, 1946), pp. 57–72. Previously trans. by Mary Bnner in *Essays on Contemporary Events* (London, 1947), for other contents of which see Vol. 10, Part III.—EDITORS.]

1 [Delivered as a lecture to a scientific meeting of the Senate of the Swiss Academy of Medical Science. Zurich, May 12, 1945. Published as “Medizin und Psychotherapie.” *Bulletin der Schweizerischen Akademie der medizinischen Wissenschaften*, I (1945): 5, 315–25.—EDITORS.]

1 [A lecture delivered to a Section of the Swiss Society for Psychotherapy at its fourth annual meeting (1941). The Section was formed to further the interests of psychotherapists in Switzerland. The lecture was published as “Die Psychotherapie in der Gegenwart” in the *Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, IV (1945), 1–18; and in *Aufsätze zur Zeitgeschichte* (Zurich, 1946), pp. 25–56, from which the present translation was made. Previously trans. by Mary Briner in *Essays on Contemporary Events* (London, 1947); cf. Vol. 10, Part III.—EDITORS.]

2 As we know, the parental imago is constituted on the one hand by the personally acquired image of the personal parents, but on the other hand by the parent archetype which exists *a priori*, i.e., in the pre-conscious structure of the psyche.

3 In *Explorations in Personality*.

4 * “Labyrinthus medicorum errantium,” p. 199 (“Theorica medica”). [The word *θεωπία* originally meant looking about one at the world.—TRANS.]

5 * “De ente Dei,” p. 226.

6 Cf. *Psychology and Alchemy*, and “Psychology and Religion.”

7 Khunrath, *Von hylealischen... Chaos*.

8 Pestalozzi said (*Ideen*, p. 187): “None of the institutions, measures, and means of education established for the masses and the needs of men in the aggregate, whatever shape or form they may take, serve to advance human culture. In the vast majority of cases they are completely worthless for that purpose and are directly opposed to it. Our race develops its human qualities in essence only from face to face, from heart to heart. Essentially it develops only in little intimate circles which gradually grow in graciousness and love, in confidence and trust. All the means requisite for the education of man, which serve to make him truly humane and to bring him to mankindliness, are in their origin and essence the concern of the individual and of such institutions as are closely and intimately attached to his heart and mind. They never were nor will be the concern of the masses. They never were nor will be the concern of civilization.” [See note 10 below.—TRANS.]

9 *Ibid.*, pp. 189f.: “The collective existence of our race can only produce civilization, not culture. [See note 10 below.—TRANS.] Is it not true, do we not see every day, that in proportion as the herd-like aggregations of men become more important, and in proportion as officialdom, which represents the legal concentration of the power of the masses, has freer play and wields greater authority, the divine breath of tenderness is the more easily extinguished in the hearts of the individuals composing these human aggregations and their officials, and that the receptivity to truth which lies deep in man’s nature perishes within them to the same degree?

“The collectively unified man, if truly he be nothing but that, sinks down in all his relations into the depths of civilized corruption, and sunk in this corruption, ceases to seek more over the whole earth than the wild animals in the forest seek.”

10 More than a hundred years ago, in times not so unlike our own, Pestalozzi wrote (*ibid.*, p. 186): “The race of men cannot remain socially united without some ordering power. Culture has the power to unite men as individuals, in independence and freedom, through law and art. But a cultureless civilization unites them as masses, without regard to independence, freedom, law or art, through the power of coercion.” [N.B. Pestalozzi evidently subscribes to the Germanic distinction between *Kultur* and *Zivilisation*, where the latter term is employed in a pejorative sense. The

idea is that culture, deriving ultimately from tillage and worship (*cultus*), is a natural organic growth, whereas civilization is an affair of the city (*civis*) and thus something artificial. Cf. note 9 above.—TRANS.]

1 [First published as “Grundfragen der Psychotherapie,” *Dialectica* (Neuchâtel). V (1951): 1, 8–24.—EDITORS.]

2 “The Relations Between the Ego and the Unconscious,” chs. II and III.

3 Kerényi, *Asklepios*, p. 83.

4 [Literally *weltanschaulich*, ‘pertaining to one’s view of the world.’ *Weltanschauung* is usually translated as ‘philosophy (of life),’ ‘world-view,’ etc. In the present context, ‘theoretical’ is used in the precise sense of the Greek *θεωρία*, which meant ‘looking about the world,’ ‘contemplation’; hence ‘speculation.’ Cf. p. 100, note 4.—TRANS.]

5 Freud, “Leonardo da Vinci” (Standard edn., Vol. XI).

6 E.g., Psalms 147:3 and Job 5:18.

7 [From *ἐκφορέω*, ‘to carry forth.’—TRANS.]

8 The concept of the archetype is a specifically psychological instance of the “pattern of behaviour” in biology. Hence it has nothing whatever to do with inherited ideas, but with modes of behaviour.

9 * Rhine, *Extra-Sensory Perception*.

1 Written in English. First published in the *British Journal of Psychology* (London), *Medical Section*, II (1921): i, 13–22. Revised and published in *Contributions to Analytical Psychology* (London and New York, 1928), pp. 282–94. Some verbal alterations to the revised version have been made here.—EDITORS.]

2 [Both published 1920.]

1 [* Delivered as a lecture, “Die praktische Verwendbarkeit der Traumanalyse,” at the 6th General Medical Congress for Psychotherapy, Dresden, April 1931, and published in the *Bericht* of the Congress; republished in *Wirklichkeit der Seele* (Zurich, 1934), pp. 68–103. Trans. from the *Bericht* by Gary F. Baynes and W. S. Dell in *Modern Man in Search of a Soul* (New York and London, 1933).—EDITORS.]

2 [This dream is discussed at greater length in “Child Development and Education,” pars. 117ff.—EDITORS.]

3 “Komplex und Mythos.”

1 [First published, in book form, as *Die Psychologie der Übertragung* (Zurich, 1946).—EDITORS.]

2 This is not to say that a transference never occurs in such cases. The negative form of transference in the guise of resistance, dislike, or hate endows the other person with great importance from the start, even if this importance is negative; and it tries to put every conceivable obstacle in the way of a positive transference. Consequently the symbolism so characteristic of the latter—the synthesis of opposites—cannot develop.

1 “Accipe canem corascenum masculum et caniculum Armeniae” (Take a Corascene dog and an Armenian bitch). —“De alchimiae difficultatibus,” *Theatrum chemicum*, I, p. 163. A quotation from Kalid (in the *Rosarium, Artis auriferae*, II, p. 248) runs: “Accipe canem coetaneum et catulam Armeniae” (Take a Coetanean dog and an Armenian bitch). In a magic papyrus, Selene (moon) is called κῶν (bitch).—Paris MS. Z 2280, in Preisendanz, *Papyri Graecae Magicae*, I, p. 142. In Zosimos, dog and wolf.—Berthelot, *Alchimistes grecs*, III, xii, 9. [No translation of the words *corascenum* and *coetaneum* has been attempted, as we are advised that they are probably corrupt, or may indicate geographical names.—EDITORS.]

2 Zosimos, in Berthelot, *Alch. grecs*, III, xii, 9.

3 The classical passage is to be found in Senior, *De chemia*, p. 8: “Tu mei indiges, sicut gallus gallinae indiget” (You need me as the cock needs the hen).

4 Numerous pictures exist in the literature.

5 Kekulé, *Lehrbuch der organischen Chemie*, I, pp. 624f., and Fierz-David, *Die Entwicklungsgeschichte der Chemie*, pp. 235ff.

6 Zacharius, “Opusculum,” *Theatr. chem.*, I, p. 826.

7 “Consilium coniugii,” *Ars chemica*, p. 259. Cf. *Aurora consurgens*, I, Ch. II: “Est namque donum et sacramentum Dei atque res divina” (For she [Wisdom] is a gift and sacrament of God and a divine matter).

8 This does not contradict the fact that the *coniunctio* motif owes its fascination primarily to its archetypal character.

9 Cf. the detailed account in Rahner, “Mysterium lunae.”

10 A collection of the classical sources is to be found in Klinz, ‘*Ἐρὸς γάμος*.’

11 Bousset, *Hauptprobleme der Gnosis*, pp. 69ff., 263f., 315ff.; Leisegang, *Der heilige Geist*, I, p. 235.

12 I call unconscious processes “hypothetical” because the unconscious is by definition not amenable to direct observation and can only be inferred.

13 I am not considering the so-called homosexual forms, such as father-son, mother-daughter, etc. In alchemy, as far as I know, this variation is alluded to only once, in the “Visio Arislei” (*Art. aurif.*, I, p. 147): “Domine, quamvis rex sis, male tamen imperas et regis: masculos namque masculis coniunxisti, sciens quod masculi non gignunt” (Lord, though thou art king, yet thou rulest and governest badly; for thou hast joined males with males, knowing that males do not produce offspring).

14 Freud says (*Introductory Lectures*, Part III, p. 455): “The decisive part of the work is achieved by creating in the patient’s relation to the doctor—in the ‘transference’—new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past.... In place of the patient’s true illness there appears the artificially constructed transference illness, in place of the various unreal objects of his libido there appears a single, and once more imaginary, object in the person of the doctor.” It is open to doubt whether the transference is always constructed artificially, since it is a phenomenon that can take place quite apart from any treatment, and is moreover a very frequent natural occurrence. Indeed, in any human relationship that is at all intimate, certain transference phenomena will almost always operate as helpful or disturbing factors.

15 “Provided only that the patient shows compliance enough to respect the necessary conditions of the analysis, we regularly succeed in giving all the symptoms of the illness a new transference meaning and in replacing his ordinary neurosis by a ‘transference-neurosis’....” (“Remembering, Repeating, and Working-Through,” P. 154.) Freud puts

down a little too much to his own account here. A transference is not by any means always the work of the doctor. Often it is in full swing before he has even opened his mouth. Freud's conception of the transference as a "new edition of the old disorder," a "newly created and transformed neurosis," or a "new, artificial neurosis" (*Introductory Lectures*, III, p. 444), is right in so far as the transference of a neurotic patient is equally neurotic, but this neurosis is neither new nor artificial nor created: it is the same old neurosis, and the only new thing about it is that the doctor is now drawn into the vortex, more as its victim than as its creator.

16 Freud had already discovered the phenomenon of the "counter-transference." Those acquainted with his technique will be aware of its marked tendency to keep the person of the doctor as far as possible beyond the reach of this effect. Hence the doctor's preference for sitting behind the patient, also his pretence that the transference is a product of his technique, whereas in reality it is a perfectly natural phenomenon that can happen to him just as it can happen to the teacher, the clergyman, the general practitioner, and—last but not least—the husband. Freud also uses the expression "transference-neurosis" as a collective term for hysteria, hysterical fears, and compulsion neuroses (*Ibid.*, p. 445).

17 The effects of this on the doctor or nurse can be very far-reaching. I know of cases where, in dealing with borderline schizophrenics, short psychotic intervals were actually "taken over," and during these periods it happened that the patients were feeling more than ordinarily well. I have even met a case of induced paranoia in a doctor who was analysing a woman patient in the early stages of latent persecution mania. This is not so astonishing since certain psychic disturbances can be extremely infectious if the doctor himself has a latent predisposition in that direction.

18 Freud himself says ("Observations on Transference-Love," p. 380) of this: "I can hardly imagine a more senseless proceeding. In doing so, an analyst robs the phenomenon of the element of spontaneity which is so convincing and lays up obstacles for himself in the future which are hard to overcome." Here Freud stresses the "spontaneity" of the transference, in contrast to his views quoted above. Nevertheless those who "demand" the transference can fall back on the following cryptic utterance of their master ("Fragment of an Analysis of a Case of Hysteria," p. 116): "If the theory of analytic technique is gone into, it becomes evident that transference is [something necessarily demanded]." [... that transference is an inevitable necessity," as in the authorized translation, is to stretch the meaning of Freud's "etwas notwendig Gefordertes."—TRANS.]

19 Suggestion happens of its own accord, without the doctor's being able to prevent it or taking the slightest trouble to produce it.

20 "Good advice" is often a doubtful remedy, but generally not dangerous because it has so little effect. It is one of the things the public expects in the *persona medici*.

21 Simon Magus' Helen (Selene) is another excellent example.

22 The reader will know that I do not understand *libido* in the original Freudian sense as *appetitus sexualis*, but as an *appetitus* which can be defined as psychic energy. See "On Psychic Energy."

23 This is the view I have put forward as an explanation of certain processes in "The Theory of Psychoanalysis."

24 Cf. Frazer, *Taboo and the Perils of the Soul*, pp. 54ff.

25 The same phenomenon can be seen on a smaller scale, but no less clearly, in the apprehension and depression which precede any special psychic exertion, such as an examination, a lecture, an important interview, etc.

26 Where the *nigredo* is identified with the *putrefactio* it does not come at the beginning, as for example in fig. 6 of our series of pictures from the *Rosarium philosophorum* (*Art. aurif.*, II, p. 254). In Mylius, *Philosophia reformata*, p. 116, the *nigredo* appears only in the fifth grade of the work, during the “putrefactio, quae in umbra purgatorii celebratur” (putrefaction which is celebrated in the darkness of Purgatory); but further on (p. 118), we read in contradiction to this: “Et haec denigratio est operis initium, putrefactionis indicium” etc. (And this *denigratio* is the beginning of the work, an indication of the putrefaction).

27 “Unconscious identity” is the same as Lévy-Bruhl’s *participation mystique*. Cf. *How Natives Think*.

28 A pictorial representation of this moment, in the form of a flash of lightning and a “stone-birth,” is to be found in my “A Study in the Process of Individuation,” Picture 2.

29 Because he is the “unknown father,” a theme to be met with in Gnosticism. See Bousset, *Hauptprobleme der Gnosis*, Ch. II, pp. 58–91.

30 Cf. Nicholas of Flüe’s vision of the threefold fountain arising in the square container (Lavaud, *Vie profonde de Nicolas de Flue*, p. 67, and Stöckli, *Die Visionen des seligen Bruder Klaus*, p. 19). A Gnostic text says: “In the second Father[hood] the five trees are standing and in their midst is a trapeza [τράπεζα]. Standing on the trapeza is an Only-begotten word [λόγος μονοενης].” (Baynes, *A Coptic Gnostic Treatise*, p. 70.) The trapeza is an abbreviation of τετράπεζα, a four-legged table or podium (ibid., p. 71). Cf. Irenaeus, *Contra haereses*, III, 11, where he compares the “fourfold gospel” with the four cherubim in the vision of Ezekiel, the four regions of the world, and the four winds: “ex quibus manifestum est, quoniam qui est omnium artifex Verbum, qui sedet super Cherubim et continet omnia, dedit nobis quadriforme Evangelium, quod uno spiritu continetur” (from which it is clear that He who is the Maker of all things, the Word [Logos] who sits above the Cherubim and holds all things together, gave unto us the fourfold gospel, which is contained in one spirit).

Concerning the kitchen, cf. Lavaud, *Vie profonde*, p. 66, and Stöckli, *Die Visionen*, p. 18.

31 This is not a metaphysical statement but a psychological fact.

32 As regards the bird with the flowering twig, see Figs, 2 and 3 infra.

33 Avalon, *The Serpent Power*, pp. 345f.

34 Freud, as we know, observes the transference problem from the standpoint of a personalistic psychology and thus overlooks the very essence of the transference—the collective contents of an archetypal nature. The reason for this is his notoriously negative attitude to the psychic reality of archetypal images, which he dismisses as “illusion.” This materialistic bias precludes strict application of the phenomenological principle without which an objective study of the psyche is absolutely impossible. My handling of the transference problem, in contrast to Freud’s, includes the archetypal aspect and thus gives rise to a totally different picture. Freud’s rational treatment of the problem is quite logical as far as his purely personalistic premises go, but both in theory and in practice they do not go far enough, since they fail to do justice to the obvious admixture of archetypal data.

35 The numerical proportion of latent to manifest psychoses is about equal to that of latent to active cases of tuberculosis.

36 The violent resistance, mentioned by Freud, to the rational resolution of the transference is often due to the fact that in some markedly sexual forms of transference there are concealed collective unconscious contents which defy

all rational resolution. Or, if this resolution is successful, the patient is cut off from the collective unconscious and comes to feel this as a loss.

37 Cf. Lully, “Testamentum,” *Bibliotheca chemica curiosa*, I, pp. 790ff., and Maier, *Symbola aureae mensae*, pp. 379f.

38 Pars. 342f.

39 Cf. “The Spirit Mercurius,” Part II, sec. 6.

40 Thus *Aurora consurgens*, II (*Art. aurif.*, I, pp. 185–246) closes with the words: “Et sic probata est medicina Philosophorum, quam omni [investiganti] fidei et pio praestare dignetur Deus omnipotens, unigenitusque filius Dei Dominus noster Jesus Christus, qui cum Patre et Spiritu sancto vivit et regnat, unus Deus per infinita saeculorum. Amen” (And this is the approved medicine of the philosophers, which may our Lord Jesus Christ, who liveth and reigneth with the Father and the Holy Ghost, one God for ever and ever, deign to give to every searcher who is faithful, pious, and of good will, Amen). This conclusion no doubt comes from the Offertorium (prayer during the *commixtio*), where it says: “... qui humanitatis nostrae fieri dignatus est particeps, Jesus Christus, Filius tuus, Dominus noster: qui tecum vivit et regnat in unitate Spiritus Sancti Deus per omnia saecula saeculorum. Amen.” (... who vouchsafed to become partaker of our humanity, Jesus Christ, Thy Son, our Lord: who liveth and reigneth with Thee in the unity of the Holy Ghost, one God, world without end. Amen.)

41 Cf. “Tractatus aureus,” *Ars chemica*, p. 21.

42 Kircher, “Oedipus Aegyptiacus,” II, Class X, Ch. V, p. 414. There is a connection between this text and the “Tabula smaragdina”; cf. Ruska, *Tabula smaragdina*, p. 217.

43 The *Rosarium* (*Art. aurif.*, II, p. 230) says: “Et scias, quod haec est longissima via, ergo patientia et mora sunt necessariae in nostro magisterio” (And you must know that this is a very long road; therefore patience and deliberation are needful in our magistry). Cf. *Aurora consurgens*, I, Ch. 10: “Tria sunt necessaria videlicet patientia mora et aptitudo instrumentorum” (Three things are necessary, namely: patience, deliberation, and skill with the instruments).

44 *Rosarium*, p. 231. What the alchemist sees in “metallic form” the psychotherapist sees in man.

45 Here I must expressly emphasize that I am not dabbling in metaphysics or discussing questions of faith, but am speaking of psychology. Whatever religious experience or metaphysical truth may be in themselves, looked at empirically they are essentially psychic phenomena, that is, they manifest themselves as such and must therefore be submitted to psychological criticism, evaluation, and investigation. Science comes to a stop at its own borders.

46 Cf. “The Spirit Mercurius,” Part II, sec. 10.

47 The alchemists also liken him to Lucifer (“bringer of light”), God’s fallen and most beautiful angel. Cf. Mylius, *Phil* ref., p. 18.

48 Cf. “Psychology and Religion,” pars. 6f.

49 I use the classical etymology of *religio* and not that of the Church Fathers.

50 Maier, *Symb. aur. mens.*, p. 386.

51 *Epistula LV* (Migne, *P.L.*, vol. 33, cols. 208–09).

52 *Homiliae in Leviticum*, V, 2 (Migne, *P.G.*, vol. 12, col. 449).

53 *Ibid.*

54 *Hom. in Librum Regnorum*, 1, 4.

55 “Hounded from one bride-chamber to the next.”—*Faust*, Part I.

56 For the same process in the individual psyche, see *Psychology and Alchemy*, pars. 44ff.

57 Cf. Ruska, *Turba*, Sermo XIX, p. 129. The term comes from the Book of El-Habib (*ibid.*, p. 43).

58 “Spiritus alme,/illustrator hominum,/horridas nostrae/mentis purga tenebras.” (Sublime spirit, enlightener of mankind, purge the horrible darknesses of our mind.)—Notker Balbulus, *Hymnus in Die Pentecostes* (Migne, *P.L.*, vol. 131, cols. 1012–13).

59 Hoghelande, “De alchemiae difficultatibus,” p. 139.

60 *Acta Joannis*, 98 (cf. James, *Apocryphal New Testament*, p. 255):... kal *ἁρμονία σοφίας* σοφία δὲ οὐσα ἐν ἁρμονίᾳ ὑπάρχουσιν δεξιοὶ καὶ ἀριστεροὶ, δυνάμεις, ἐξουσίαι, ἀρχαὶ καὶ δαίμονες, ἐνέργειαι...* (“... Harmony of wisdom, but when there is wisdom the left and the right are in harmony: powers, principalities, archons, daemons, forces...”).

61 Cardan (*Somniorum synesiorum...*) is an excellent example of one who examined his own dreams.

62 As regards the work of reinterpretation, see my “Brother Klaus.” Also Lavaud, *Vie profonde*, Ch. III, “La Grande Vision.”

1 [These mottoes, where they appear, translate the verses under the woodcuts in the figures. Figs. 1–10 are full pages reproduced from the Frankfurt first edition (1550) of the *Rosarium philosophorum*. The textual quotations, however, are taken from the version printed in *Art. aurif.*, II (Basel, 1593), except for the poem at par. 528.—EDITORS.]

2 The “Cons, coniug.” (*Ars chemica*, p. 147) says: “Et locus generationis, licet sit artificialis, tamen imitatur naturalem, quia est concavus, conclusus” etc. (The place of gestation, even though it is artificial, yet imitates the natural place, since it is concave and closed). And (p. 204): “Per matricem, intendit fundum cucurbitae” (By matrix he means the root of the gourd).

3 Cf. Ruska, *Turba*, p. 163.

4 Cf. Hortulanus (Ruska, *Tabula smaragdina*, p. 186): “Unde infinitae sunt partes mundi, quas omnes philosophus in tres partes dividit scilicet, in partem Mineralem Vegetabilem et Animalem.... Et ideo dicit habens tres partes philosophiae totius mundi, quae partes continentur in unico lapide scilicet Mercurio Philosophorum” (Hence the parts of the world are infinite, all of which the philosopher divides into three parts, namely mineral, vegetable, animal.... And therefore he claims to have the three parts of the philosophy of the whole world, which parts are contained in the single stone, namely the Mercurius of the Philosophers). Ch. 13: “Et ideo vocatur lapis iste perfectus, quia in se habet naturam mineralium et vegetabilium et animalium. Est enim lapis triunus et unus, quatuor habens naturas” (And this stone is called perfect because it has in itself the nature of mineral, vegetable, and animal. For the stone is triple and one, having four natures).

5 Cf. the alchemical doctrine of the *incretum*: *Psychology and Alchemy*, pars. 430ff.

6 A quotation based on Rosinus in *Rosarium*, p. 249, says: “Triplex in nomine, unus in esse.” Cf. the threefold fountain of God in the vision of Brother Klaus (Lavaud, *Vie profonde*, p. 66). The actual Rosinus passage (itself a quotation from Rhazes) runs (*Art. aurif.*, I, p. 300): “Lapis noster cum mundi creato[re] nomen habet, qui est trinus et unus” (Our stone has a name common with the Creator of the world who is triple and one). Senior (*De chemia*, p. 45) says: “Aes nostrum est sicut homo, habens spiritum, animam et corpus. Propterea dicunt sapientes: Tria et Tria sunt unum. Deinde dixerunt: in uno sunt tria.” (Our copper is like a man, having spirit, soul, and body. Therefore the wise men say: Three and Three are One. Further they said: In One there are Three.) Cf. also Zosimos (Berthelot, *Alch. greca*, III, vi, 18). The mercurial fountain recalls the *πηγή μεγάλη* of the Peratics (Hippolytus, *Elenchos*, V, 12, 2), which forms one part of the threefold world. The three parts correspond to 3 gods, 3 *λόγοι*, 3 spirits (*μοῖ*), 3 men. This triad is opposed by a Christ equipped with all the properties of the triad and himself of triadic nature, coming from above, from the *ἀγεννησία*, before the separation. (Here I prefer Bernays’ reading *πρὸ τῆς* [cf. *Elenchos*, p. 105] because it makes more sense.)

7 In Abū’l-Qāsim the lapis is called *al-shaitan*, ‘Satan’; cf. Holmyard, “Abū’l-Qāsim al-Irāqī,” p. 422.

8 The serpent is also *triplex nomine*, as the inscriptions “animalis,” “vegetabilis,” “mineralis” show.

9 *Psychology and Alchemy*, fig. 20.

10 “Practica,” *Art. aurif.*, I, p. 321: “Ipsa sunt duo fumi complectentes duo lumina” (They are the two vapours enveloping the two lights).

11 We find the same motif in the frontispiece of Colonna, *Le Songe de Poliphile*, as the leaves which fall from the tree rooted in the fire. See *Psychology and Alchemy*, fig. 4.

12 Cf. *Aurora consurgens*, I, Ch. IV: “Evil odours and vapours that infect the mind of the laborant.” Also Morienus (*Art. aurif.*, II, p. 34): “Hic enim est odor, qui assimilatur odori sepulcrorum....” (For this is the odour that is similar to the stench of the graves...).

13 The interpretation of uneven numbers as masculine and of even numbers as feminine is general in alchemy and originated in antiquity.

14 [For the 2nd edn., there has been a change in the sequence of pars. 405–407, in order to place Jung’s summarizing statement in what would seem to be its logical position, i.e., present par. 407.—EDITORS.]

15 Cf. Jacobi, *Psychology of C. G. Jung*, Diagrams IV–VII.

16 For the soul as square, circle, or sphere see *Psychology and Alchemy*, pars. 109 and 439, n. 47.

17 The above remarks should be understood only psychologically and not in the moral sense. The “deed” as such is not the essence of the psychic life-process but only a part of it, although a very important part.

18 Incidentally, Johann Valentin Andreae, the real author of the *Chymical Wedding*, also wrote a Faust drama in Latin entitled *Turbo, sive Molestie et frustra per cuncta divagans ingenium* (1616), the story of a man who knew everything and was finally disappointed, but who found his salvation in the *contemplatio Christi*. The author, a theologian in Württemberg, lived from 1586 to 1654.

19 I have dealt with this psychological process at length in *Two Essays*, pars. 224f., 380f.

20 An allusion to madness. The *afflictio animae* is mentioned in Olympiodorus (Berthelot, *Alch. grecs*, II. iv, 43). Morienus (*Art. aurif.*, II, p. 18), and Maier (*Symb. aur. mens.*, p. 568), and in Chinese alchemy (Wei Po-yang, “An Ancient Chinese Treatise,” pp. 241–45).

21 God is the source, river, and sea which all contain the same water. The Trinity is a life that “proceeds from itself to itself, by way of itself”—Vansteenberghe, *Le Cardinal Nicolas de Cues*, pp. 296f.

1 *Debita materia*, meaning the *prima materia* of the process.

2 *Rosarium*, p. 219: “Nota bene: In arte nostri magisterii nihil est celatum a Philosophis excepto secreto artis, quod non licet cuiquam revelare: quodsi fieret, ille malediceretur et indignationem Domini incurreret et apoplexia moreretur. Quare omnis error in arte existit ex eo quod debitam materiam non accipiunt. Igitur venerabili utimini natura, quia ex ea et per eam et in ea generatur ars nostra et non in alio: et ideo magisterium nostrum est opus naturae et non opificis.”

3 Ruska, *Turba*, Sermo XXIX, p. 137.

4 Cf. *Aurora consurgens*, I, where the parables “Of the Black Earth,” “Of the Flood of Waters and of Death,” “Of the Babylonish Captivity,” are followed by the parable “Of the Philosophic Faith” with its avowal of the *lumen de lumine*. Cf. also Avicenna, “Declaratio lapidis physici,” *Theatr. chem.*, IV, p. 990.

5 A corruption of “alchymia.”

6 *De incertitudine et vanitate omnium scientiarum*, Ch. XC.

7 Later, Agrippa (*ibid.*) says one or two other things about the stone: “As to that unique and blessed substance, besides which there is no other although you may find it everywhere, as to that most sacred stone of the philosophers—almost I had broken my oath and made myself a desecrator of temples by blurting out its name—I shall nevertheless speak in circumlocutions and dark hints, so that none but the sons of the art and the initiates of this mystery shall understand. The thing is one which has neither too fiery nor too earthen a substance.... More I am not permitted to say, and yet there be greater things than these. However. I consider this art—with which I have a certain familiarity—as being the most worthy of that honour which Thucydides pays to an upright woman, when he says that the best is she of whom least is said either in praise or blame.” Concerning the oath of secrecy, see also Senior, *De chemia*, p. 92: “Hoc est secretum, super quo iuraverunt, quod non indicarent in aliquo libro” (This is the secret which they promised on oath not to divulge in any book).

8 Both texts are supposed to have been in circulation in manuscript from about 1610, according to F. Maack, editor of Rosencreutz’s *Chymische Hochzeit*, pp. xxxviif. [They are to be found there at pp. 47–84.—EDITORS.]

9 A kind of “rosie cross” can also be seen in Luther’s crest.

10 Cf. *Psychology and Alchemy*, par. 436, and Reitzenstein and Schaeder, *Studien zum antiken Synkretismus*.

11 Waite, *The Secret Tradition*.

12 Wei Po-yang, p. 241.

13 The union of “like with like” in the form of homosexual relationships is to be found in the “Visio Arislei” (*Art. aurif.*, I, p. 147), marking the stage preceding the brother-sister incest.

14 According to Freud, these projections are infantile wish-fantasies. But a more thorough examination of neuroses in childhood shows that such fantasies are largely dependent on the psychology of the parents, that is, are caused by the parents’ wrong attitude to the child. Cf. “Analytical Psychology and Education,” pars. 216ff.

15 Hence *Aurora consurgens*, I, Ch. VI, says: “... and all my bones are troubled before the face of my iniquity.” Cf. Ps. 37 : 4 (D.V.): “... there is no peace for my bones, because of my sins.”

16 Cf. *Two Essays*, pars. 296ff. [Also “Concerning the Archetypes, with Special Reference to the Anima Concept” and *Aion*, ch. 3.—EDITORS.]

17 It may be helpful to remind the reader that in Rider Haggard's *She* there is a description of this "royal" figure. Leo Vincey, the hero, is young and handsome, the acme of perfection, a veritable Apollo. Beside him there stands his fatherly guardian, Holly, whose resemblance to a baboon is described in great detail. But inwardly Holly is a paragon of wisdom and moral rectitude—even his name hints at "holy." In spite of their banality both of them have superhuman qualities, Leo as well as the devout "baboon." (Together they correspond to the *sol et umbra eius*.) The third figure is the faithful servant who bears the significant name of Job. He stands for the long-suffering but loyal companion who has to endure both superhuman perfection and subhuman baboonishness. Leo may be regarded as the sun-god; he goes in quest of "She" who "dwells among the tombs" and who is reputed to kill her lovers one by one—a characteristic also ascribed by Benoit to his "Atlantide"—and to rejuvenate herself by periodically bathing in a pillar of fire. "She" stands for Luna, and particularly for the dangerous new moon. (It is at the *synodus* of the *novilunium*— i.e., at the *coniunctio* of the Sun and Moon at the time of the new moon—that the bride kills her lover.) The story eventually leads, in *Ayesha*, another novel of Haggard's, to the mystical hierogamos.

18 The alchemical pairs of opposites are often arranged in such quaternions, as I shall show in a later work. [Cf. *Mysterium Coniunctionis*, pp. 6ff., and *Aion*, pp. 250ff.—EDITORS.]

19 Naumann (ed.), *Isländische Volksmärchen*, No. 8, pp. 47ff.

20 Guterman (trans.), *Russian Fairy Tales*, pp. 351ff.

21 The Russian arch-witch.

22 *The Native Tribes of S.E. Australia*, p. 157; cf. Frazer, *Totemism and Exogamy*, I, p. 306.

23 Layard, *Stone Men of Malekula*, pp. 62ff.

24 Hocart, *Kings and Councillors*, p. 265.

25 [Pars. 433ff. incorporate corrections made by Dr. John Layard in 1955 with reference to his own writings and authorized by Jung in the 1958 Swiss edition. Later corrections made by Dr. Layard (1965) are given in square brackets.—EDITORS.]

26 *Ibid.*, pp. 157, 193.

27 Layard, *Stone Men of Malekula*, pp. 85ff.

28 Hocart, *Kings and Councillors*, pp. 244ff.

29 *Ibid.*, p. 250.

30 Layard, "The Incest Taboo," pp. 270ff.

31 I would remind the reader that Rex and Regina are usually brother and sister or sometimes mother and son.

32 If we think at all when doing these things, it must be a preconscious or rather an unconscious act of thought. Psychological explanations cannot very well get on without such an hypothesis.

33 *The Northern Tribes of Central Australia*, p. 74.

34 Layard, "The Incest Taboo," p. 284.

35 *Ibid.*, p. 293.

36 In this system a man marries his [mother's mother's brother's daughter's daughter].

37 Hocart, *Kings and Councillors*, p. 259.

38 In China, for instance, one can still find vestiges of the twelve-class system.

39 Layard, "The Incest Taboo," pp. 281ff.

40 Ibid., p. 284. Perhaps I may point out the similar conclusions reached in *Symbols of Transformation*, pars. 464ff.

- 1 An Arabic treatise whose origin is still obscure. It is printed in *Ars chemica*, and (with scholia) in *Bibl. chem. curiosa*, I, pp. 400ff.
- 2 This passage is rather different in ‘the original text (*Ars chemica*, p. 14): “in quo est nisus tuae dispositionis, et adunatio cuiuslibet sequestrati.” Cf. *Psychology and Alchemy*, par. 385 and n. 87.
- 3 *Art. aurif.*, II, pp. 227–38.
- 4 Cf. Cant. 5:3: “I have put off my garment.”
- 5 Original is illegible: ?vgan.
- 6 This is the reading of the 1593 edition. The first edition of 1550 has “vivificat.”
- 7 The dove is also the attribute of the goddess of love and was a symbol of *amor coniugalis* in ancient times.
- 8 Cf. Joannes Lydus, *De mensibus*, II, 11: “The sixth day they ascribe to Phosphorus [morning star], who is the begetter of warmth and generative moisture [γονίμως ὑγραίνοντι]. Perhaps this is the son of Aphrodite, like Hesperus the evening star, as appeared to the Greeks. Aphrodite we could call the nature of the visible universe, the first-born Hyle which the oracle names star-like [Ἄστεριαν] as well as heavenly. The number 6 is most skilled in begetting [γεννητικώτατος], for it is even and uneven, partaking both of the active nature on account of the uneven [περιττὸν also means “superfluous” or “excessive”], and of the hylical nature on account of the even, for which reason the ancients also named it marriage and harmony. For among those that follow the number 1, it is the only number perfect in all its parts, being composed of these: its halves of the number 3, its thirds of the number 2, and its sixths of the number 1 [6 = 3 + 2 + 1]. And they say also that it is both male and female, like Aphrodite herself, who is of male and female nature and is accordingly called hermaphroditic by the theologians. And another says that the number 6 is soul-producing [or belongs to the ψυχογονία, ψυχογονικός], because it multiplies itself into the worldsphere [ἐπιπεδούμενος = πολλαπλασιασμός], and because in it the opposites are mingled. It leads to like-mindedness [ὁμόνοιαν] and friendship, giving health to the body, harmony to songs and music, virtue to the soul, prosperity to the state, and forethought [πρόνοιαν] to the universe.”

1 Dorn, "Speculativae philosophiae," p. 303: "Studio philosophorum comparatur putrefactio chemica.... Ut per solutionem corpora solvuntur, ita per cognitionem resolvuntur philosophorum dubia" (The chemical putrefaction can be compared with the study of the philosophers.... As bodies are dissolved through the *olutio*, so the doubts of the philosophers are resolved through knowledge).

2 Instead of the meaningless "aqua foetum" I read "aqua foetida" (*Rosarium*, p. 241). Cf. "Cons, coniug.," *Ars chemica*, p. 64: "Leo viridis, id est... aqua foetida, quae est mater omnium ex qua et per quam et cum qua praeparant..." (The green lion, that is... the stinking water, which is the mother of all things, and out of it and through it and with it, they prepare...).

3 *Rosarium*, p. 214. Cf. *Aurora consurgens*, I, Ch. XII, where the bride says of herself in God's words (Deut. 32 : 39): "I will kill and I will make to live... and there is none that can deliver out of my hand."

4 *Rosarium*, p. 213.

5 *Ibid.*, p. 237. This goes back to Senior, *De chemia*, pp. 19, 31, 33.

6 Cf. *Psychology and Alchemy*, fig. 159.

7 "Addam et processum," *Theatr. chem.*, III, pp. 8538. Cf. *Psychology and Alchemy*, pars. 480ff.

8 *Aurora consurgens*, I, Ch. IX, "qualis pater talis filius, talis et Spiritus Sanctus et hi tres unum sunt, corpus, spiritus et anima, quia omnis perfectio in numero ternario consistit, hoc est mensura, numero et pondere" (Like as the Father is, so is the Son, and so also is the Holy Spirit, and these three are One, body, spirit, and soul, for all perfection consisteth in the number three, that is, in measure, number, and weight.)

9 "Anima vocatur Rebis." "Exercitationes in Turbam," *Art. aurif.*, I, p. 180.

10 According to Firmicus Maternus (*Mathesis* V, pref., ed, Kroll and Skutsch, II, p. 3), Luna is "humanorum corporum mater."

11 Psychologically one should read *mens* for *spiritus*.

12 Sometimes the spirit is the *vinculum*, or else the latter is a *natura ignea* (Zacharius, "Opusculum," *Theatr. chem.*, I, p. 887).

13 Cf. "De arte chimica." *Art. aurif.*, I, pp. 584ff, and Mylius, *Phil. ref.*, p. 9.

14 Cf. "Turba," *Art. aurif.*, I, p. 180: "... Spiritus et corpus unum sunt mediante anima, quae est apud spiritum et corpus. Quod si anima non esset, tunc spiritus et corpus separarentur ab invicem per ignem, sed anima adiuncta spiritui et corpori, hoc totum non curat ignem nec ullam rem mundi." (... The spirit and the body are one, the soul acting as a mediator which abides with the spirit and the body. If there were no soul, the spirit and the body would be separated from each other by the fire, but because the soul is joined to the spirit and the body, this whole is unaffected by fire or by any other thing in the world.)

15 Cf. Winthuis, *Das Zweigeschlechterwesen*.

16 I do not, of course, mean the synthesis or identification of two individuals, but the conscious union of the ego with everything that has been projected into the "You." Hence wholeness is the product of an intrapsychic process which depends essentially on the relation of one individual to another. Relationship paves the way for individuation and makes it possible, but is itself no proof of wholeness. The projection upon the feminine partner contains the anima and sometimes the self.

17 Cf. *Psychology and Alchemy*, index.

18 *Rosarium*, p. 369.

19 *Psychology and Alchemy*, pars. 430ff.

20 P. 251.

21 Cf. Frobenius, *Das Zeitalter des Sonnengottes*.

22 “Visio Arislei,” *Art. aurif.*, I, p. 148: “Mansimus in tenebris undarum et intenso aestatis calore ac maris perturbatione” (We remained in the darkness of the waves and in the intense heat of summer and the perturbation of the sea).

23 Cf. the birth of Mithras “from the sole heat of libido” (de solo aestu libidinis). Jerome, *Adversus Jovinianum* (Migne, *P.L.*, vol. 23, col. 246). In Arabic alchemy, too, the fire that causes the fusion is called “libido.” Cf. “Exercitationes in Turbam.”

Art. aurif., I, p. 181: “Inter supradicta tria (scil., corpus, anima, spiritus) inest libido,” etc. (Between the aforementioned three, i.e., body, soul, spirit, there is a libido).

24 See the inscription to fig. 5a:

“But here King Sol is tight shut in,

And *Mercurius philosophorum* pours over him.”

The sun drowning in the mercurial fountain (*Rosarium*, p. 315) and the lion swallowing the sun (p. 367) both have this meaning, which is also an allusion to the *ignea natura* of Mercurius (Leo is the House of the Sun). For this aspect of Meicurius see “The Spirit Mercurius,” Part II, sec. 3.

1 *Rosarium*, p. 248. Quotation from Kalid, “Liber secretorum alchemiae,” *Art. aurif.*, I, p. 340. [Cf. par. 353, n. 1.—EDITORS.]

2 P. 247.

3 p. 248.

4 Kalid, “Liber secretorum alchemiae,” *Art. aurif.*, I, p. 340: “Et dixit. Hermes patri suo: Pater timeo ab inimico in mea mansione. Et dixit: Fili, accipe canem masculum Corascenem et caniculam Armeniae et iunge in simul et parient canem coloris coeli et imbibe ipsum una siti ex aqua maris: quia ipse custodiet tuum amicum et custodiet te ab inimico tuo et adiuvabit te ubicumque sis, semper tecum existendo in hoc mundo et in alio.” (And Hermes said to his father: Father, I am afraid of the enemy in my house. And he said: My son, take a Corascene dog and an Armenian bitch, join them together, and they will beget a dog of a celestial hue, and if ever he is thirsty, give him sea water to drink: for he will guard your friend, and he will guard you from your enemy, and he will help you wherever you may be, always being with you, in this world and in the next.)

5 *Rosarium*, p. 248. The radiant quality (*στίλβων*) is characteristic of Mercurius and also of the first man, Gayomart or Adam. Cf. Christensen, *Les Types du premier homme*, pp. 22ff., and Kohut, “Die talmudisch-midrassische Adamssage,” pp. 68, 72, 87.

6 The “Practica Mariae” (*Art. aurif.*, I, p. 321) makes the two into four: “[Kibrich et Zubech]... ipsa sunt duo fumi complectentes duo Iumina” (They are the two vapours enveloping the two lights). These four evidently correspond to the four elements, since we read on p. 320: “... si sunt apud homines omnia 4 elementa, dixit compleri possent et complexionari et coagulari eorum fumi...” (If there are in men all 4 elements, he says, their vapours could be completed and commingled and coagulated).

7 See Lambspringk, “Figurae,” *Musaeum hermeticum*.

8 Frontispiece to Colonna, *Le Songe de Poliphile*. See *Psychology and Alchemy*, fig. 4.

9 Hence the ambivalent saying in Mylius, *Phil. ref.*, p. 182: “In habentibus symbolum facilis est transitus” (For those who have the symbol the passage is easy).

10 Cf. Kalid, “Liber trium verborum,” *Art aurif.*, I, pp. 355f.

11 “No more shall you stay a prisoner
 Wrapped in darkest obfuscation;
 New desires call you upwards
 To the higher copulation.”—*West-östlicher Divan*.

1 “Tractatulus Avicennae,” *Art. aurif.*, I, p. 426.

2 Cf. *Aurora*, I, Ch. XII (after John 12:24). Hortulanus (Ruska, *Tabula*, p. 186): “Vocatur [lapis] etiam granum frumenti, quod nisi mortuum fuerit, ipsum solum manet,” etc. (It [the stone] is also called the grain of wheat, which remains itself alone, unless it dies). Equally unhappy is the other comparison, also a favourite: “Habemus exemplum in ovo quod putrescit primo, et tunc gignitur pullus, qui post totum corruptum est animal vivens” (We have an example in the egg: first it putrefies and then the chick is born, a living animal sprung from the corruption of the whole).—*Rosarium*, p. 255.

3 Cf. Ruska, *Turba*, p. 139: “Tunc autem, doctrinae filii, illa res igne indiget, quousque illius corporis spiritus vertatur et per noctes dimittatur, ut homo in suo tumulo, et pulvis fiat. His peractis reddet ei Deus et animam suam et spiritum, ac infirmitate ablata confortatur illa res... quemadmodum homo post resurrectionem fortior fit,” etc. (But, sons of the doctrine, that thing will need fire, until the spirit of its body is changed and is sent away through the nights, like a man in his grave, and becomes dust. When this has happened, God will give back to it its soul and its spirit and, with all infirmity removed, that thing is strengthened... as a man becomes stronger after the resurrection.)

4 Cf. the *ψυχογονία* in Lydus’ account of the hexad, supra, par. 451, n. 8.

5 Cf. Senior, *De chemia*, p. 16: “... et reviviscit, quod fuerat morti deditum, post inopiam magnam” (What had been given over to death, comes to life again after great tribulation).

6 For the alchemist, this had a precedent in Gen. 2:17: “for in the day that thou eatest thereof thou shalt surely die.” Adam’s sin is part of the drama of the creation. “Cum peccavit Adam, eius est anima mortua” (When Adam sinned his soul died), says Gregory the Great (Epist. CXIV, Migne, *P.L.*, vol. 77, col. 806).

7 *Art. aurif.*, II, p. 324.

8 The *nigredo* appears here not as the initial state but as the product of a prior process. The time-sequence of phases in the *opus* is very uncertain. We see the same uncertainty in the individuation process, so that a typical sequence of stages can only be constructed in very general terms. The deeper reason for this “disorder” is probably the “timeless” quality of the unconscious, where conscious succession becomes simultaneity, a phenomenon I have called “synchronicity.” [Cf. Jung, “Synchronicity: An Acausal Connecting Principle.”] From another point of view we would be justified in speaking of the “elasticity of unconscious time” on the analogy of the equally real “elasticity of space.” For the relations between psychology and atomic physics, see Meier, “Moderne Physik.”

9 Ezek. 8 : 14: “... behold, there sat women weeping for Tammuz.”

10 Berthelot, *Alch. grecs*, II, i, 3: ‘Η φύσις τῆ φύσει τέρκεται, καὶ ἡ φύσις τὴν φύσιν νικᾷ καὶ ἡ φύσις τὴν φύσιν κρατεῖ.

11 Merlinus probably has as little to do with Merlin the magician as “King Artus” with King Arthur. It is more likely that Merlinus is “Mercurinus,” a diminutive form of Mercurius and the pseudonym of some Hermetic philosopher. “Artus” is the Hellenistic name for Horus. The form “Merqûlius” and “Marqûlius” for Mercurius is substantiated in Arabic sources. Jûnân ben Marqûlius is the Greek Ion, who according to Byzantine mythology is a son of Mercurius (Chwolsohn, *Die Ssabier* I, p. 796). Al-Maqrizi says: “The Merqûlians... are the Edessenes who were in the neighbourhood of Harran,” obviously the Sabaeans (ibid., II, p. 615). The Ion in Zosimos (Berthelot, *Alch. grecs*, III, i, 2) probably corresponds to the above Ion. [Cf. “The Visions of Zosimos,” par. 86, n. 4.—EDITORS.]

12 Merlinus, “Allegoria de arcano lapidis,” *Art. aurif.*, I, pp. 392ff.: “Rex autem... bibit et rebibit, donec omnia membra sua repleta sunt, et omnes venae eius inflatae” (But the king drinks and drinks again until all his limbs are full and all his veins inflated). [Cf. *Mysterium Coniunctionis*, pp. 266f.—EDITORS.]

13 In the “Tractatus aureus” (*Mus. herm.*, p. 51) the king drinks the “aqua pernigra,” here described as “pretiosa et sana,” for strength and health. He represents the new birth, the self, which has assimilated the “black water,” i.e., the unconscious. In the Apocalypse of Baruch the black water signifies the sin of Adam, the coming of the Messiah, and the end of the world.

14 *Aurora*, II, in *Art. aurif.*, I, p. 196.

15 Hence the warning: “Cave ab hydropisi et diluvio Noe” (Beware of dropsy and the flood of Noah).—Ripley, *Omnia opera chemica*, p. 69.

16 Cf. *Psychology and Alchemy*, pars. 456f.

17 One of several versions.

18 This is meant only as a psychological and not as a metaphysical parallel.

19 Cf. *Psychological Types*, pars. 434ff.

1 “Tractatus aureus,” *Mus. herm.*, p. 47.

2 Quotation from a source unknown to me, given as “Sorin” in *Rosarium*, p. 264.

3 One such case is described in Meier, “Spontanmanifestationen,” p. 290.

4 *Art. aurif.*, II, p. 264: “Et eorum aquas sua aqua continere, si qua non est aqua, forma ignea verae aquae.”

5 Remembering the rule that every proposition in psychology may be reversed with advantage, I would point out that it is always a bad thing to accentuate the conscious attitude when this has shown itself to be so strong in the first place as violently to suppress the unconscious.

6 *Art. aurif.*, II, p. 265.

7 *The Dark Night of the Soul*.

8 Ventura, “De ratione conficiendi lapidis,” *Theatr. chem.*, II, p. 260. There is in the gold a “quiddam essentiale Divinum” (something of Divine essence) (“Tractatus Aristotelis,” *Theatr. chem.*, V, p. 892). “Natura est vis quaedam insita rebus.... Deus est natura et natura Deus, a Deo oritur aliquid proximum ei” (Nature is a certain force innate in things.... God is Nature and Nature is God, and from God originates something very near to him).—Penotus, “Quinquaginta septem canones,” *Theatr. chem.*, II, p. 153. God is known in the *linea in se reducto* of the gold (Maier, *De circulo physico quadrato*, p. 16).

9 Hippolytus, *Elenchos*, VII, 26, 10.

10 Angelus Silesius, *Cherubinischer Wandersmann*, Book IV, p. 194: “The work that God loves best and most wants done/Is this: that in you he can bear his son.” Book II, p. 103: “There where God bends on you his spirit mild/Is born within the everlasting child.”

1 Cf. Judges 6 : 36ff.

2 Cf. “The Spirit Mercurius,” II, sec. 2.

3 *Art. aurif.*, II, pp. 275f. Cf. Senior, *De chemia*, pp. 17–18: “Dixit iterum Maria: Aqua, quam iam memoravi, est rex de coelo descendens et terra cum humore suo suscepit eum et retinetur aqua coeli cum aqua terrae propter servitium suum et propter arenam suam honorat eam et congregatur aqua in aquam, Alkia in Alkiam et dealbatur Alkia cum Astuam.” In the Arabic text “Astua” appears also as “Alkia”; “al-kiyān” = “vital principle” (Stapleton, “Three Arabic Treatises,” p. 152). “Alkia” occurs in the “Liber Platonis quattorum” (p. 152) in the sense of “vital principle” or “libido.”

4 Azoth is the arcane substance (cf. Senior, *De chemia*, p. 95) and the lato is the black substance, a mixture of copper, cadmium, and orichalcum (*ἐλατρών*; see Du Cange, *Glossarium*).

5 *Rosarium*, p. 277. This oft-repeated quotation is to be found in the treatise of Morienus (“Sermo de transmutatione metallorum,” *Art. aurif.*, II, pp. 7ff.), which appears to have been translated from the Arabic by Robert of Chartres in the 12th century. Morienus attributes it to the obsolete author Elbo Interfecto. It must be of very early origin, but hardly earlier than the 8th century.

6 Reference to the “Tab. smarag.”: “Itaque vocatus sum Hermes Trismegistus habens tres partes philosophiae totius mundi” (Therefore I am called Hermes Trismegistus, having the three parts of the philosophy of the whole world).

7 A classic of Arabic origin, put into Latin between the 11th and 12th centuries. The *Turba* quotation in the *Rosarium* comes from “Rosinus ad Sarratantam,” *Art. aurif.*, I, pp. 284f. The *Turba* (ed. Ruska, p. 158) has only: “Siccum igitur humido miscete, quae sunt terra et aqua; ac igne et aere coquite, unde spiritus et anima desiccantur” (Therefore mix the dry with the moist, which are earth and water, and cook them with fire and air, whence spirit and soul are dried out).

8 A reference to the saying of Morienus (“De transmutatione metallorum,” *Art. aurif.*, II, p. 21): “... omnis festinatio [scil. festinantia] ex parte Diaboli est” (... all haste is of the devil). Hence the *Rosarium* says (p. 352): “Ergo qui patientiam non habet ab opere manum suspendat, quia impedit cum ob festinantiam credulitas” (Therefore, he who hath not patience, let him hold back his hand from the work, for credulity will ensnare him if he hasten).

9 *Rosarium*, p. 277. Identical with *Aurora consurgens*, I, Ch. I.

10 John 4 : 13–14: “... Whosoever drinketh of this water shall thirst again: But whosoever drinketh of the water that I shall give him shall never thirst; but the water that I shall give him shall be in him a well of water springing up into everlasting life.”

11 Koch, “Cusanus-Texte,” p. 124: “In puteo Jacob est aqua, quae humano ingenio quaesita et reperta est, et potest significari quoad hoc philosophia humana, quae penetratione laboriosa sensibilibus quaeritur. In Verbo autem Dei, quod est in profundo vivi putei, scil. humanitatis Christi, est fons refrigerans spiritum. Et ita notemus puteum sensibilem Jacob, puteum rationalem, et puteum sapientialem. De primo puteo, qui est naturae animalis et altus, bibunt pater, filii et pecora; de secundo, qui altior in orizonte naturae, bibunt filii hominum tantum, scil. ratione vigentes, et philosophi vocantur; de tertio, qui altissimus, bibunt filii excelsi, qui dicuntur dii et sunt veri theologi. Christus secundum humanitatem puteus quidem dici potest altissimus.... In illo profundissimo puteo est fons sapientiae, quae praestat felicitatem et immortalitatem... portat vivus puteus fontem suae vitae ad sitientes, vocat sitientes ad aquas salubres, ut aqua sapientiae salutaris reficiantur.”

12 Ibid., p. 132: “Qui bibit spiritum, bibit fontem scaturientem.”

13 Ibid., p. 134: “Adhuc nota, quod intellectus nobis datus est cum virtute seminis intellectualis: unde in se habet principium fontale, mediante quo in seipso generat aquam intelligentiae, et fons ille non potest nisi aquam suae naturae producere, scilicet humanae intelligentiae, sicut intellectus principii, ‘quodlibet est vel non est’ producit aquas metaphysicales, ex quibus alia flumina scientiarum emanant indesinenter.”

14 Cardan, *Somniorum synesiorum*: “Unumquodque somnium ad sua generalia deducendum est.”

15 “... subtilietur lapis, donec in ultimam subtilitatis puritatem deveniat et ultimo volatilis fiat” (The stone should be subtilized until it reaches the ultimate purity of refinement and becomes, in the end, volatile).—*Rosarium*, p. 351. Or again (ibid., p. 285): “Sublimatio est duplex: Prima est remotio superfluitatis, ut remaneant partes purissimae a faecibus elementaribus segregatae sicque virtutem quintae essentiae possideant. Et haec sublimatio est corporum in spiritum reductio cum scilicet corporalis densitas transit in spiritus subtilitatem.” (Sublimation is twofold: The first is the removal of the superfluous so that the purest parts shall remain, free from elementary dregs, and shall possess the quality of the quintessence. The other sublimation is the reduction of the bodies to spirit, i.e., when the corporeal density is transformed into a spiritual subtlety.)

16 Cf. *Psychological Types*, Definitions 21 (in Baynes edn., Def. 20), 35, 47, 53.

17 [Eugen Steinach (1861–1944), Austrian physiologist who experimented with rejuvenation by grafting animal glands.—EDITORS.]

1 Cf. Lamspringk's *Symbols, Mus. Herm.*, p. 355, with the verses:

“Nidus in sylva reperitur in quo Hermes suos pullos habet, (A nest is found in the forest in which Hermes has his
Unus semper conatur volatum, Alter in nido manere birds. One always tries to fly away, The other rejoices in
gaudet, Et alter alterum non dimittit.” the nest to stay And will not let the other go.)

This image comes from Senior, *De chemia*, p. 15: “Abscisae sunt ab eo alae et pennae et est manens, non recedens ad superiora” (Its wings are cut off and its feathers, and it is stationary, not returning to the heights). Likewise Stolcius de Stolcenberg, *Viridarium chymicum*, Fig. XXXIII. In Maier, *De circulo*, p. 127, the opposites are represented as “vultur in cacumine montis et corvus sine alis” (a vulture on the peak of the mountain and a raven without wings). Cf. “Tractatus aureus,” *Ars chem.*, pp. 11–12, and “Rosinus ad Sarratantam,” *Art. aurif.*, I, p. 316.

2 Cf. “Paracelsus as a Spiritual Phenomenon,” pars. 201f.

3 *Psychology and Alchemy*, fig. 235.

4 *Art. aurif.*, II, p. 377: “De Tinctura alba: Si parentes dilecti mei de vita gustaverint et lacte mero lactati fuerint et meo albo inebriati fuerint et in lectulo meo nupserint, generabunt filium Lunae, qui totam parentelam suam praevalerit. Et si dilectus meus de tumulo rubeo petrae potaverit et fontem matris suae gustaverit et inde copulatus fuerit et vino meo rubeo et mecum inebriatus fuerit et in lecto [meo] mihi amicablem concubuerit, et in amore meo sperma suum cellulam meam subintraverit, concipiam et ero praegnans et tempore meo pariam filium potentissimum, dominantem et regnantem prae cunctis regibus et principibus terrae, coronatum aurea corona victoriae, ad omnia a Deo altissimo, qui vivit et regnat in saeculorum saecula.” Cf. “Cons, coniug.,” *Ars chem.*, p. 129, and “Rosinus ad Sarratantam,” pp. 291ff.

5 The style of the pictures dates them to the 16th cent., but the text may be a century older. Ruska (*Tab. smarag.*, p. 193) assigns the text to the 14th cent. The later dating, 15th cent. (Ruska, *Turba*, p. 342), is probably the more accurate.

6 *Psychology and Alchemy*, par. 500.

7 See *ibid.*, fig. 220.

8 Cant. 3:11: “... see king Solomon in the diadem, wherewith his mother crowned him in the day of his espousals.” Gregory the Great comments that the mother is Mary “quae coronavit eum diademate, quia humanitatem nostram ex ea ipsa assumpsit.... Et hoc in die desponsationis eius... factum esse dicitur: quia quando unigenitus filius Dei divinitatem suam humanitati nostrae copulare voluit, quando.... Ecclesiam sponsam suam sibi assumere placuit: tunc... carnem nostram ex matre Virgine suscipere voluit” (who crowned him with the crown because he assumed our human nature from her.... And that is said to have been done on the day of his espousals, because, when the only-begotten son of God wished to join his divinity with our human nature, he decided to take unto himself, as his bride, the Church. Then it was that he willed to assume our flesh from his virgin mother).—St Gregory, *Super Cantica Canttorum expositio*, ch. III (Migne, *P.L.*, vol. 79, col. 507.)

9 “Gloria mundi,” *Mus. herm.*, p. 213.

10 *Liber etymologiarum*, XIII, 14.

11 *Psychology and Alchemy*, par. 92.

12 Philalethes, “Introitus apertus,” *Mus. herm.*, p. 654.

13 *De chemia*, p. 17.

14 It is just possible that the idea of the *diadema* is connected with the cabalistic *Kether* (corona). The *Diadema purpureum* is *Malchuth*, “the female,” “the bride.” Purple relates to the *vestmentum*, an attribute to the Shekinah (the Divine Presence), which “enim est Vestis et Palatium Modi Tiphereth, non enim potest fieri mentio Nominis Tetragrammati nisi in Palatio eius, quod est Adonai. Apellaturque nomine *Diadematis*, quia est Corona in capite mariti sui” (... is the Garment and the Palace of the Modus Tiphereth [Glory], for no mention can be made of the Four-Letter Name which is Adonai, except in His Palace. And it is called by the name of Diadem because it is the crown on the head of the husband)—Knorr von Rosenroth, *Kabbala denudata*, I, p. 131. “... Malchuth vocatur Kether nempe corona legis,” etc. (Malchuth is called Kether since it is the crown of the Law). “Sephirah decima vocatur Corona: quia est mundus Dilectionum, quae omnia circumdant,” etc. (The tenth Sephira [number] is called the crown, because it is the world of delights which surround all things).—Ibid., p. 487. “[Corona] sic vocatur Malchuth, quando ascendit usque ad Kether; ibi *enim existens est* Corona super caput mariti sui” ([The Crown] is called Malchuth when it ascends up to Kether; for there is the crown upon the head of the husband).—Ibid., p. 624. Cf. Goodenough, “The Crown of Victory in Judaism.”

15 Norton’s “Ordinall” (*Theatr, chem. britannicum*, p. 40) says:

“For greatly doubted evermore all suche,
 That of this Scyence they may write too muche:
 Every each of them tought but one pointe or twayne,
 Whereby his fellowes were made certayne:
 How that he was to them a Brother,
 For every of them understoode each other;
 Alsoe they wrote not every man to teache,
 But to shew themselves by a secret speache:
 Trust not therefore to reading of one Boke,
 But in many Auctors works ye may looke;
 Liber librum apperit saith Arnolde the great Clerke.”

“The Book of Krates” (Berthelot, *Moyen âge*, III, p. 52) says: “Your intentions are excellent, but your soul will never bring itself to divulge the truth, because of the diversities of opinion and of wretched pride.” Hoghelande (“De alch. diff.,” *Theatr. chem.*, I, p. 155) says: “At haec [scientia]... tradit opus suum immiscendo falsa veris et vera falsis, nunc diminute nimium, nunc superabundanter, et sine ordine, et saepius praepostero ordine, et nititur obscure tradere et occultare quantum potest” (This [science] transmits its work by mixing the false with the true and the true with the false, sometimes very briefly, at other times in a most prolix manner, without order and quite often in the reverse order; and it endeavours to transmit [the work] obscurely, and to hide it as much as possible). Senior (*De chemia*, p. 55) says: “Verum dixerunt per omnia, Homines vero non intelligunt verba eorum... unde falsificant veridicos, et verificant falsificos opinionibus suis.... Error enim eorum est ex ignorantia intentionis eorum, quando audiunt diversa verba, sed ignota intellectui eorum, cum sint in intellectu occulto.” (They told the truth in regard to all things, but men do not understand their words... whence through their assumptions they falsify the verities and verify the falsities.... The error springs from ignorance of their [the writers’] meaning, when they hear divers words unknown to their understanding, since these have a hidden meaning.) Of the secret hidden in the words of the wise, Senior says: “Est

enim illud interius subtiliter perspicientis et cognoscentis” (For this belongs to him who subtly perceives and is cognizant of the inner meaning). The *Rosarium* (p. 230) explains: “Ego non dixi omnia apparentia et necessaria in hoc opere, quia sunt aliqua quae non licet homini loqui” (So I have not declared all that appears and is necessary in this work, because there are things of which a man may not speak). Again (p. 274): “Talis materia debet tradi mystice, sicut poësis fabulose et parabolice” (Such matters must be transmitted in mystical terms, like poetry employing fables and parables). Khunrath (*Von hyl. Chaos*, p. 21) mentions the saying: “Arcana publicata vilescunt” (secrets that are published become cheap)—words which Andreae used as a motto for his *Chymical Wedding*. Abū’l Qâsim Muhammad ibn Ahmad al-Simāwī, known as al-Irāqī, says in his “Book of the Seven Climes” (see Holmyard, “Abū’l-Qâsim,” p. 410) regarding Jābir ibn Hayyān’s method of instruction: “Then he spoke enigmatically concerning the composition of the External and the Internal.... Then he spoke darkly... that in the External there is no complete tincture and that the complete tincture is to be found only in the Internal. Then he spoke darkly... saying, Verily we have made the External nothing more than a veil over the Internal... that the Internal is like this and like that and he did not cease from this kind of behaviour until he had completely confused all except the most quick-witted of his pupils....” Wei Po-yang (c. 142 A.D.) says: “It would be a great sin on my part not to transmit the Tao which would otherwise be lost to the world forever. I shall not write on silk lest the divine secret be unwittingly spread abroad. In hesitation I sigh....” (“An Ancient Chinese Treatise,” p. 243).

16 The parallel to this is the paradoxical relation of Malchuth to Kether, the lowest to the highest (see note 14 above).

17 P. 270.

18 He is thought to be identical with Joannes de Garlandia, who lived in the second half of the 12th cent. and wrote the “Commentarius in Tabulam smaragdinam,” in *De alchemia* (1541).

19 Ibid., p. 365. Since the alchemists were, as “philosophers,” the empiricists of the psyche, their terminology is of secondary importance compared with their experience, as is the case with empiricism generally. The discoverer is seldom a good classifier.

20 Thus Dom (“Physica Trismegisti,” *Theatr. chem.*, I, p. 409) says: “Spagirica foetura terrestris caelicam naturam induat per ascensum, et deinceps suo descensu centri naturam terreni recipiat” (This earthly, spagyric birth clothes itself with heavenly nature by its ascent, and then by its descent visibly puts on the nature of the centre of the earth).

21 This explains why the projection usually has some influence on the carrier, which is why the alchemists in their turn expected the “projection” of the stone to bring about a transmutation of base metals.

22 The alchemists regarded the arrow as the *telum passionis* of Mercurius.

23 Rosencreutz, *The Chymical Wedding*, p. 212.

24 Waite, *Real History of the Rosicrucians*.

25 Intoxicants that induce delirious states can also release these processes, for which purpose datura (Jimson weed) and peyotl are used in primitive rites. See Hastings, *Encyclopedia*, IV, pp. 735f.

26 As this book was written in 1943, I leave this sentence as it stands, in the hope of a better world to come.

27 This process is described in the second of my *Two Essays*.

28 Cf. “Tractatulus Aristotelis,” *Art. aurif.*, I, p. 371.

29 A good example of this is to be found in Angelus Silesius, *Cherubinischer Wandersmann*, Book III, no. 238:

“God is made man and now is born—rejoice!

Where then? In me, the mother of his choice.

How should that be? My soul that Virgin Maid,

My heart the manger and my limbs the shed....”

30 In woman the animus produces very similar illusions, the only difference being that they consist of dogmatic opinions and prejudices which are taken over at random from somebody else and are never the product of her own reflection.

31 She is the Euthicia of the treatise of Rosinus (= Zosimos) in *Art. aurif.*, I, pp. 277ff.

32 The *Mutus liber* is reproduced as an appendix to Vol. I of the *Bibl. chem. curiosa*, 1702. For illustrations from the *Mutus Liber*, see figs. 11–13 of the present volume, and *Psychology and Alchemy*, index. We might mention John Pordage and Jane Leade (17th cent.) as another pair of alchemists. See *infra*.

33 *A Suggestive Inquiry into the Hermetic Mystery*.

34 John Pordage (1607–1681) studied theology and medicine in Oxford. He was a disciple of Jakob Boehme and a follower of his alchemical theosophy. He became an accomplished alchemist and astrologer. One of the chief figures in his mystical philosophy is Sophia. (“She is my divine, eternal, essential self-sufficiency. She is my wheel within my wheel,” etc.—Pordage’s *Sophia*, p. 21.)

35 The letter is printed in Roth-Scholz, *Deutsches Theatrum chemicum*, I, pp. 557–97. The first German edition of this “Philosophisches Send-Schreiben vom Stein der Weissheit” seems to have been published in Amsterdam in 1698. [The letter was evidently written in English, since the German version in Roth-Scholz, 1728–32, is stated to be “aus dem Englischen übersetzt.” But no English edition or MS. can be traced at the British Museum, the Library of Congress, or any of the other important British and American libraries. Pordage’s name does not occur among the alumni at Oxford.—EDITORS.]

36 One of the favourite allusions to the Song of Songs 7:2: “Thy navel is like a round goblet, which wanteth not liquor.” Cf. also *Aurora consurgens*, I, Ch. XII.

37 The concluding passages are very reminiscent of the teachings of the “secta liberi spiritus,” which were propagated as early as the 13th century by the Béguines and Beghards.

38 Hence Pordage’s view is more or less in agreement with woman’s conscious psychology, but not with her unconscious psychology.

39 Pordage, *Sophia*, Ch. I.

40 There is a modern work that gives an excellent account of the feminine world of symbols: Esther Harding’s *Woman’s Mysteries*.

41 Florence, Ashburnham 1166, 14th cent. They are reproduced as figs. 131 and 135 in *Psychology and Alchemy*.

42 The arrow refers to the *telum passionis* of Mercurius. Cf. “Cantilena Riplaei” in *ibid.*, par. 491, and *Mysterium Coniunctionis*, pp. 285fr. Cf. also “The Spirit Mercurius,” Part II, sec. 8, and St. Bernard of Clairvaux, *Sermones in Cantica*, XXX, 8 (Migne, *P.L.*, vol. 183, cols. 932–33): “Est et sagitta sermo Dei vivus et efficax et penetrabilior omni gladio ancipiti.... Est etiam sagitta electa amor Christi, quae Mariae animam non modo confixit, sed etiam pertransivit, ut nullam in pectore virginali particulam vacuum amore relinqueret.” (God’s word is an arrow; it is lively and effective and more penetrating than a double-edged sword.... And the love of Christ is a choice arrow too, which

not only entered, but transfixed, the soul of Mary, so that it left no particle of her virgin heart free of love.)—Trans. by a priest of Mount Melleray, I, p. 346.

43 Cf. the Alaskan Eskimo tale “The Woman Who Became a Spider,” in Rasmussen, *Die Gabe des Adlers*, pp. 121ff., and the Siberian tale “The Girl and the Skull,” in Kunike (ed.), *Märchen aus Sibirien*, No. 31, where a woman marries a skull.

44 Ed. Macaulay, II, p. 35: motto of Book I. Cf. St. Bernard of Clairvaux, *Sermones in Cant.*, XXIX, 8 (Migne, *P.L.*, vol. 183, col. 933) (of Mary): “Et illa quidem in tota se grande et suave amoris vulnus accepit...” (And she indeed received a great and sweet wound of love in all her being).

1 “Numerus perfectus est denarius” (the perfect number is ten).—Mylius, *Phil. ref.*, p. 134. The Pythagoreans regarded the *δεκάς* as the *τέλειος ἀριθμός*.—Hippolytus, *Elenchos*, I, 2, 8. Cf. Joannes Lydus, *De mensibus*, 3, 4, and Proclus, *In Platonis Timaeum Commentaria*, 21 AB. This view was transmitted to alchemy through the *Turba* (pp. 300ff., “Sermo Pythagorae”). Dorn (“Congeries,” *Theatr. chem.* I, p. 622) says: “Quando quidem ubi Quaternarius et Ternarius ad Denarium ascendunt, eorum fit ad unitatem regressus. In isto concluditur arcano omnis occulta rerum sapientia.” (When the number four and the number three ascend to the number ten, they return to the One. In this secret all the hidden wisdom of things is contained.) But he denies (“Duellum animi,” *Theatr. chem.*, I, p. 545) that $1 + 2 + 3 + 4 = 10$, since 1 is not a number, maintaining that the denarius comes from $2 + 3 + 4 = 9 + 1$. He insists on the elimination of the devilish binarius (ibid., pp. 542ff.). John Dee (“Monas hieroglyphica,” *Theatr. chem.*, II, p. 220) derives the denarius in the usual way: the *antiquissimi Latini philosophi* assumed that the *crux rectilinea* meant the denarius. The old author Artefius (probably an Arab) also derives the denarius by adding together the first four numbers (“Clavis,” *Theatr. chem.*, IV, p. 222). But later he says that 2 is the first number, and he proceeds to make the following operation: $2 + 1 = 3$, $2 + 2 = 4$, $4 + 1 = 5$, $4 + 3 = 7$, $7 + 1 = 8$, $8 + 1 = 9$, $8 + 2 = 10$, and says that “eodem modo centenarii ex denariis, millenarii vero ex centenariis procreantur” (in the same way the hundreds are produced out of the tens, and the thousands out of the hundreds). This operation can be regarded as either enigmatic or childish.

2 According to Hippolytus (*Elenchos*, IV, 43, 4), the Egyptians said that God was a *μονὰς ἀδιαίρετος* (an indivisible unity), and that 10 was a monad, the beginning and end of all number.

3 The denarius as an *allegoria Christi* is to be found in Rabanus Maurus, *Allegoriae in universam sanctam Scripturam* (Migne, *P.L.*, vol. 112, col. 907).

4 “Audi atque attende: Sal antiquissimum Mysterium! Cuius nucleum in Denario, Harpocratice, sile.” (Listen and pay heed: Salt is the oldest mystery. Hide its nucleus in the number ten, after the manner of Harpocrates.)—Khunrath, *Amphitheatrum*, p. 194. The salt is the salt of wisdom. Harpocrates is the genius of the secret mysteries. Cf. *Psychology and Alchemy*, figs. 52 and 253.

5 There is a parallel to this in the system of Monoïmos (Hippolytus, *Elenchos*, VIII, 12, 2ff.). The son of Oceanus (the Anthropos) is an indivisible monad and yet divisible: he is mother and father, a monad that is also a decad. “Ex denario divino statues unitatem” (Out of the divine number ten you will constitute unity).—Quotation from Job. Dausten in Aegidius de Vadis, “Dialogus,” *Theatr. chem.*, II, p. 115. Dausten, or Dastyne, was probably an Englishman; certain authorities date him at the beginning of the 14th cent., others much later. See Ferguson, *Bibl. chem.*, I, s.v. “Dausten.”

6 Norton’s “Ordinall,” *Theatr. chem, britannicum*, p. 48. Philalethes (“Fons chemicae veritatis,” *Mus. herm.*, p. 802) says: “Qui semel adeptus est, ad Autumnum sui laboris pervenit” (He who has once found it has reached the harvest time of his work). This is a quotation from Johannes Pontanus, who lived about 1550 and was a physician and professor of philosophy at Königsberg. Cf. Ferguson, *Bibl. chem.*, II, p. 212.

7 It is worth noting that St. John of the Cross pictures the ascent of the soul in ten stages.

8 “Ipsa omnia sunt ex uno et de uno et cum uno, quod est radix ipsius” (They are all from the One, and of the One, and with the One, which is the root of itself).—*Art. aurif.*, II, p. 369.

9 Nicholas of Cusa, in his *De docta ignorantia*, regarded antinomical thought as the highest form of reasoning.

10 Cf. “Rosinus ad Sarratantam,” *Art. aurif.*, I, p. 309: “Cuius [lapidis] mater virgo est, et pater non concubuit” (Its [the stone’s] mother is a virgin, and the father lay not with her).

11 Cf. Petrus Bonus, “Pretiosa margarita novella,” *Theatr. chem.*, V, p. 649: “Cuius mater virgo est, cuius pater foeminam nescit. Adhuc etiam noverunt, quod Deus fieri debet homo, quia in die novissima huius artis, in qua est operis complementum, generans et generatum fiunt omnino unum: et senex et puer et pater et filius fiunt omnino unum. Ita quod omnia vetera fiunt nova.” (Whose mother is a virgin and whose father knew not woman. They knew also that God must become man, because on the last day of this art, when the completion of the work takes place, begetter and begotten become altogether one. Old man and youth, father and son, become altogether one. Thus all things old are made new.)

12 Cf. Dante, *Paradiso*, XXXIII, i: “O Virgin Mother, daughter of thy son.”

13 “Sermo de transmutatione metallorum,” *Art. aurif.*, II, p. 37.

14 Cf. “Psychology and Religion,” pars. 95ff., 153ff.; and *Psychology and Alchemy*, pars. 342ff.

15 It goes without saying that these concepts offer no solution of any metaphysical problem. They neither prove nor disprove the immortality of the soul.

16 *Art. aurif.*, II, pp. 356f.: “Patet ergo quod Philosophorum Magister lapis est, quasi diceret, quod naturaliter etiam per se facit quod tenetur facere: et sic Philosophus non est Magister lapidis, sed potius minister. Ergo qui quaerit per artem extra naturam per artificium inducere aliquid in rem, quod in ea naturaliter non est, errat et errorem suum deflebit.” [The above translation follows the author’s German version. An equally likely translation of the “quasi diceret” clause would be: “as if it (the stone) were to say that it does of its own nature that which it is held to do.”—A.S.B.G.]

17 The Persian Gayomart is as broad as he is long, hence spherical in shape like the world-soul in Plato’s *Timaeus*. He is supposed to dwell in each individual soul and in it to return to God. See Reitzenstein and Schaefer, *Studien zum antiken Synkretismus*, p. 25.

18 Cf. “The Spirit Mercurius.”

19 Possibly from βαφή (*tinctura*) and μῆτις (skill, sagacity), thus roughly corresponding to the Krater of Hermes filled with voûs. Cf. Nicolai, *Versuch über die Beschuldigungen, welche dem Tempelherrenorden gemacht wurden*, p. 120; Hammer-Purgstall, *Mysterium Baphometis*, pp. 3ff.

20 Cf. *Psychology and Alchemy*, fig. 70, showing a snake ritual. There is no certain connection of snake worship with the Templars (Hammer-Purgstall, *Mémoire sur deux coffrets gnostiques*).

21 Anastasius Sinaïta, *Anagogicae contemplationes*: “Et cum vel suffocatus esset et perisset tenebrosus corvus Satan...” (And when the dark raven Satan [or: of Satan] was suffocated or had perished...). St. Ambrose, *De Noe et Arca*, I, 17 (Migne, *P.L.*, vol. 14, col. 411): “Siquidem omnis impudentia atque culpa tenebrosa est et mortuis pascitur sicut corvus...” (If indeed all shamelessness and guilt is dark and feeds on the dead like a raven...). Again, the raven signifies the sinners: St. Augustine, *Annotationes in Job*, I, xxviii, 41 (Migne, *P.L.*, vol. 34, col. 880): “Significantur ergo nigri [scl. corvi] hoc est peccatores nondum dealbati remissione peccatorum” (They signify the black [raven], i.e., the sinners not yet whitened by remission of their sins). Paulinus of Aquileia, *Liber exhortationis* (Migne, *P.L.*, vol. 99, col. 253): “anima peccatoris... quae nigrior corvo est” (The soul of a sinner... which is blacker than a raven).

22 *Art. aurif.*, II, p. 359. See *Psychology and Alchemy*, fig. 54.

23 For further pictures of the Rebis see *ibid.*, Index, s.v. “hermaphrodite.”

24 The identification of the *prima materia* with God occurs not only in alchemy but in other branches of medieval philosophy as well. It derives from Aristotle and its first appearance in alchemy is in the Harranite “Treatise of Platonic Tetralogies” (“Liber Platonis Quartorum,” *Theatr. chem.*, V). Mennens (“Aureum vellus,” *Theatr. chem.*, V, p. 334) says: “Nomen itaque quadrilaterum Dei sanctissimam Trinitatem designare videtur et materiam, quae et umbra eius dicitur et a Moyse Dei posteriora vocatur” (Therefore the four-letter name of God seems to signify the Most Holy Trinity and the Materia, which is also called his shadow, and which Moses called his back parts). Subsequently this idea crops up in the philosophy of David of Dinant, who was attacked by Albertus Magnus. “Sunt quidam haeretici dicentes Deum et materiam primam et *νοῦν* sive mentem idem esse” (There are some heretics who say that God and the prima materia and the nous or mind are the same thing).—*Summa Theologica*, I, 6, qu. 29, memb. 1 art. 1, par. 5 (*Opera*, ed. Borgnet, vol. 31, p. 294). Further details in Krönlein, “Amalrich von Bena,” pp. 303ff.

25 The idea of the hermaphrodite is seemingly to be met with in later Christian mysticism. Thus Pierre Poiret (1646–1719), the friend of Mme Guyon, was accused of believing that, in the millennium, propagation would take place hermaphroditically. The accusation was refuted by Cramer (Hauck, *Realencyklopädie*, XV, p. 496), who showed that there was nothing of this in Poiret’s writings.

26 It is interesting to see how this theory once more joined forces with alchemy in Herbert Silberer’s book, *Problems of Mysticism and Its Symbolism*.

27 *De docta ignorantia*, II, 3: “Maximum autem est, cui nihil opponitur, ubi et Minimum est Maximum.”

28 “Ultra hanc coincidentiam creare cum creari es tu Deus.”

29 *De conjecturis*, II, 14: “Homo enim Deus est, sed non absolute, quoniam homo. Humane igitur est Deus. Homo etiam mundus est, sed non contracte omnia, quoniam homo. Est igitur homo *μικρόκοσμος*.”

30 *Of Learned Ignorance* (trans. Heron), p. 173: “Debet autem in his profundis omnis nostri humani ingenii conatus esse, ut ad illam se elevet simplicitatem, ubi contradictoria coincidunt.”

1 Of these I would draw attention only to the series contained in *Mutus liber*, where the adept and his *soror mystica* are shown performing the *opus*. The first picture (fig. 11) shows an angel waking the sleeper with a trumpet; in the second picture (fig. 12), the pair of alchemists kneel on either side of the Athanor (furnace) with the sealed phial inside it, and above them are two angels holding the same phial, which now contains Sol and Luna, the spiritual equivalents of the two adepts. The third picture (fig. 13) shows, among other things, the sotor catching birds in a net and the adept hooking a nixie with rod and line: birds, being volatile creatures, stand for thoughts or the pluralistic animus, and the nixie corresponds to the anima. The undisguisedly psychic character of this portrayal of the *opus* is probably due to the fact that the book was written comparatively late—1677.

EDITORIAL NOTE

Personality as the expression of the wholeness of man is defined by Jung as an adult ideal whose conscious realization through individuation is the aim of human development in the second half of life. It is to the study of this aim that Jung has devoted his main attention in all his later work. It is manifest that in childhood and adolescence the ego is brought into being and firmly established; no account of individuation, therefore, would be complete without a psychological outline of the early formative period of development.

The present volume is a collection of Professor Jung's papers on child psychology and education, of which the three lectures on "Analytical Psychology and Education" are the chief item. Jung regards the psychology of parents and educators as of the greatest importance in the maturation and growth to consciousness of the children—especially so in the case of those who are unusually gifted. He emphasizes that an unsatisfactory psychological relationship between the parents may be an important cause of psychogenic disorders in childhood. It has been thought relevant to include Jung's paper on "Marriage as a Psychological Relationship" and, finally, to link up the problems of childhood with those of individuation in the adult by adding the essay which gives the present volume its title.

The essay "Child Development and Education" is presented here for the first time under this title. It previously appeared as one of the four lectures on "Analytical Psychology and Education," published in *Contributions to Analytical Psychology*; yet it had been delivered on a different occasion from the three others, its subject-matter is different, and it is not included by Jung in *Psychologie und Erziehung*, which contains the three other lectures. It contains a significant textual change by the author: an important statement in paragraph 106 on the subject of archetypal images in the dreams of children. Editorial reference is given to the privately printed record of Jung's seminars on the subject.

Only the essay "The Gifted Child" and the introduction to Frances Wickes's book *Analyse der Kinderseele* have not previously been translated into English, apart from the brief alteration mentioned above. But the author has considerably revised the essays on education, so that much new matter is to be found in this volume, which will, it is hoped, help to set forth Jung's position in regard to child psychology.

TRANSLATOR'S NOTE

With the exception of the “Introduction to Wickes’s *Analyse der Kinderseele*” and “The Gifted Child,” all the papers in the present volume were previously translated by various hands and published in *Collected Papers on Analytical Psychology* (2nd edition, London, 1917, and New York, 1920), *Contributions to Analytical Psychology* (London and New York, 1928), and *The Integration of the Personality* (New York, 1939; London, 1940). Several of them, as indicated in the footnotes at the beginning of each paper, have since been revised and expanded by the author. I would like to express my thanks to the late Dr. A. A. Brill, Mr. Stanley Dell, and in particular to Mrs. Cary F. Baynes, for permission to make full use of the earlier texts in preparing the present revised versions.

TABLE OF CONTENTS

EDITORIAL NOTE

TRANSLATOR'S NOTE

I. Psychic Conflicts in a Child

Translated from "Über Konflikte der kindlichen Seele," *Psychologie und Erziehung* (Zurich: Rascher, 1946).

II. Introduction to Wickes's *Analyse der Kinderseele*

Translated from the German edition (Stuttgart: Hoffman, 1931).

III. Child Development and Education

Translated from the unpublished German original.

IV. Analytical Psychology and Education

Translated from "Analytische Psychologie und Erziehung," *Psychologie und Erziehung* (Zurich: Rascher, 1946).

Lecture One, —Lecture Two, —Lecture Three

V. The Gifted Child

Translated from "Der Begabte," *Psychologie und Erziehung* (Zurich: Rascher, 1946).

VI. The Significance of the Unconscious in Individual Education

Translated from the unpublished German original.

VII. The Development of Personality

Translated from "Vom Werden der Persönlichkeit," *Wirklichkeit der Seele* (Zurich: Rascher, 1934).

VIII. Marriage as a Psychological Relationship

Translated from “Die Ehe als psychologische Beziehung,” *Seelenprobleme der Gegenwart* (Zurich: Rascher, 1931).

BIBLIOGRAPHICAL NOTE

INDEX

PSYCHIC CONFLICTS IN A CHILD

[**The third of a series of lectures on “The Association Method,”** delivered on the 20th anniversary of the opening of Clark University, Worcester, Massachusetts, September, 1909. The original version was published under the title “Über Konflikte der kindlichen Seele,” *Jahrbuch für psychoanalytische und psychopathologische Forschungen*, II (1910), 33ff. It was translated by A. A. Brill and published in the *American Journal of Psychology*, XXI (1910), in a Clark University anniversary volume (1910), and in *Collected Papers on Analytical Psychology* (1st edn., London, 1916; 2nd edn., London, 1917, and New York, 1920). The revised version, of which this present essay is a translation, appeared in *Psychologie und Erziehung* (Zurich, 1946). The first two lectures comprising “The Association Method” were never published in German but were included in the aforementioned 1910 and 1916 publications. See Vol. 2 of the *Coll. Works.*—EDITORS.]

FOREWORD TO THE SECOND EDITION

I am publishing this little study just as it is, without making any alterations for the second edition. Although in point of fact our conceptions have been considerably modified and extended since these observations first appeared in 1910, I do not feel that the subsequent modifications would justify me in describing the views put forward in the first edition as basically false, an imputation that has been laid against me in certain quarters. On the contrary, just as the observations here recorded have retained their value as facts, so also have the conceptions themselves. But no conception is ever all-embracing, for it is always dominated by a point of view. The point of view adopted in this work is psycho-biological. It is naturally not the only one possible, indeed there are several others. Thus, more in accord with the spirit of Freudian psychology, this little piece of child psychology could be regarded from the purely hedonistic standpoint, the psychological process being conceived as a movement dominated by the pleasure principle. The main motives would then be the desire for and the striving towards the most pleasurable, and hence the most satisfying, realization of fantasy. Or, following Adler's suggestion, one could regard the same material from the standpoint of the power principle, an approach which is psychologically just as legitimate as that of the hedonistic principle. Or one could employ a purely logical approach, with the intention of demonstrating the development of logical processes in the child. One could even approach the matter from the standpoint of the psychology of religion and give prominence to the earliest beginnings of the God-concept. I have been content to steer a middle course that keeps to the psycho-biological method of observation, without attempting to subordinate the material to this or that hypothetical key principle. In so doing I am not, of course, contesting the legitimacy of such principles, for they are all included in our human nature; but only a very one-sided specialist would think of declaring as universally valid the heuristic principle that had proved its particular value for his discipline or for his individual method of observation. The essence of human psychology, precisely because so many different possible principles exist, can never be fully comprehended under any one of them, but only under the totality of individual aspects.

The basic hypothesis of the view advanced in this work is that sexual interest plays a not inconsiderable role in the nascent process of infantile thinking, an hypothesis that should meet with no serious opposition. A contrary hypothesis would certainly come up against too many well-observed facts, quite apart from its being extraordinarily improbable that a fundamental instinct of such cardinal importance for human psychology should not make itself felt in the infantile psyche from the very beginning.

On the other hand I also lay stress on the significance of *thinking* and the importance of concept-building for the solution of psychic conflicts. It should be sufficiently clear from what follows that the initial sexual interest strives only figuratively towards an immediate sexual goal, but far more towards the development of thinking. Were this not so, the solution of the conflict could be reached solely through the attainment of a sexual goal, and not through the mediation of an intellectual concept. But precisely the latter is the case, from which we may conclude that infantile sexuality is not to be identified outright with adult sexuality, since adult sexuality cannot be adequately replaced by concept-building, but is in most cases only satisfied with the real sexual goal, namely the tribute of normal sexual functioning which nature exacts. On the other hand, we know from experience that the infantile beginnings of sexuality can also lead to real sexual functioning—masturbation—when the conflicts are not resolved. The building of concepts, however, opens out to the libido a channel that is capable of further development, so that its continual, active realization is assured. Given a certain intensity of conflict, the absence of concept-building acts as a hindrance which thrusts the libido back into its initial sexuality, with the result that these beginnings or buddings are brought prematurely to an abnormal pitch of development. This produces an infantile neurosis. Gifted children in particular, whose mental demands begin to develop early on account of their intelligent disposition, run a serious risk of premature sexual realization through the suppression of what their parents and teachers would call an unsuitable curiosity.

As these reflections show, I do not regard the thinking function as just a makeshift function of sexuality which sees itself hindered in its pleasurable realization and is therefore compelled to pass over into the thinking function; but, while perceiving in infantile sexuality the beginnings of a future sexual function, I also discern there the seeds of higher spiritual functions. The fact that infantile conflicts can be resolved through concept-building speaks in favour of this, and also the fact that even in adult life the vestiges of infantile sexuality are the seeds of vital spiritual functions. The fact that adult sexuality grows out of this polyvalent germinal disposition does not prove that infantile sexuality is “sexuality” pure and simple. I therefore dispute the rightness of Freud’s idea of the “polymorphous-perverse” disposition of the child. It is simply a *polyvalent* disposition. If we proceeded according to the Freudian formula, we should have to speak, in embryology, of the ectoderm as the brain, because from it the brain is ultimately developed. But much also develops from it besides the brain, for instance the sense organs and other things.

December, 1915

C. G. J.

FOREWORD TO THE THIRD EDITION

Since this paper first appeared, almost thirty years have gone by. Yet it would seem that this little work has not given up the ghost, but is in increasing demand with the public. In one or two respects, certainly, it has never grown stale, firstly because it presents a simple series of facts such as occur repeatedly and are found to be much the same everywhere; secondly because it demonstrates something of great practical and theoretical importance, namely the characteristic striving of the child's fantasy to outgrow its "realism" and to put a "symbolic" interpretation in the place of scientific rationalism. This striving is evidently a natural and spontaneous expression of the psyche, which for that very reason cannot be traced back to any "repression" whatsoever. I stressed this particular point in my Foreword to the second edition, and my mention of it there has not lost its topicality, since the myth of the polymorphous sexuality of the child is still sedulously believed in by the majority of specialists. The repression theory is as grossly overestimated as ever, while the natural phenomena of psychic transformation are accordingly underestimated, if not entirely ignored. In 1912, I made these phenomena the subject of a compendious study, which cannot be said even now to have penetrated the intellects of psychologists as a class. I trust therefore that the present modest and factual report will succeed in rousing the reader to reflection. Theories in psychology are the very devil. It is true that we need certain points of view for their orienting and heuristic value; but they should always be regarded as mere auxiliary concepts that can be laid aside at any time. We still know so very little about the psyche that it is positively grotesque to think we are far enough advanced to frame general theories. We have not even established the empirical extent of the psyche's phenomenology: how then can we dream of general theories? No doubt theory is the best cloak for lack of experience and ignorance, but the consequences are depressing: bigotedness, superficiality, and scientific sectarianism.

To document the polyvalent germinal disposition of the child with a sexual terminology borrowed from the stage of fully-fledged sexuality is a dubious undertaking. It means drawing everything else in the child's make-up into the orbit of sexual interpretation, so that on the one hand the concept of sexuality is blown up to fantastic proportions and becomes nebulous, while on the other hand spiritual factors are seen as warped and stunted instincts. Views of this kind lead to a rationalism which is not even remotely capable of doing justice to the essential polyvalence of the infantile disposition. Even though a child may be preoccupied with matters which, for adults, have an undoubtedly sexual complexion, this does not prove that the nature of the child's preoccupation is to be regarded as equally sexual. For the cautious and

conscientious investigator sexual terminology, as applied to infantile phenomena, can be deemed at most a professional *façon de parler*. I have my qualms about its appropriateness.

Apart from a few small improvements I am allowing this paper to appear once again in unaltered form.

C. G. J.

PSYCHIC CONFLICTS IN A CHILD

- [1] About the time when Freud published his report on the case of “Little Hans,”¹ I received from a father who was acquainted with psychoanalysis a series of observations concerning his little daughter, then four years old.
- [2] These observations have so much that bears upon, and supplements, Freud’s report on “Little Hans” that I cannot refrain from making this material accessible to a wider public. The widespread incomprehension, not to say indignation, with which “Little Hans” was greeted, was for me an additional reason for publishing my material, although it is nothing like as extensive as that of “Little Hans.” Nevertheless, it contains points which seem to confirm how typical the case of “Little Hans” is. So-called “scientific” criticism, so far as it has taken any notice at all of these important matters, has once more proved overhasty, seeing that people have still not learned first to examine and then to judge.
- [3] The little girl to whose sagacity and intellectual sprightliness we are indebted for the following observations is a healthy, lively child of emotional temperament. She has never been seriously ill, nor had she ever shown any trace of “nervous” symptoms.
- [4] Livelier systematic interests awakened in the child about her third year; she began to ask questions and to spin wishful fantasies. In the report which now follows we shall, unfortunately, have to give up the idea of a consistent exposition, for it is made up of anecdotes which treat of one isolated experience out of a whole cycle of similar ones, and which cannot, therefore, be dealt with scientifically and systematically, but must rather take the form of a story. We cannot dispense with this mode of exposition in the present state of our psychology, for we are still a long way from being able in all cases to separate with unerring certainty what is curious from what is typical.
- [5] When the child, whom we will call Anna, was about three years old, she had the following conversation with her grandmother:
- “Granny, why are your eyes so dim?”
- “Because I am old.”
- “But you will become young again?”
- “Oh dear, no. I shall become older and older, and then I shall die.”
- “And what then?”
- “Then I shall be an angel.”

“And then you will be a baby again?”

[6] The child found here a welcome opportunity for the provisional solution of a problem. For some time she had been in the habit of asking her mother whether she would ever have a real live doll, a baby brother, which naturally gave rise to the question of where babies come from. As such questions were asked quite spontaneously and unobtrusively, the parents attached no significance to them, but responded to them as lightly as the child herself seemed to ask them. Thus one day she was told the pretty story that children are brought by the stork. Anna had already heard somewhere a slightly more serious version, namely that children are little angels who live in heaven and are then brought down by the said stork. This theory seems to have become the point of departure for the little one's investigating activities. From the conversation with the grandmother it could be seen that this theory was capable of wide application; for it solved in a comforting manner not only the painful thought of dying, but at the same time the riddle of where children come from. Anna seemed to be saying to herself: “When somebody dies he becomes an angel, and then he becomes a child.” Solutions of this sort, which kill at least two birds with one stone, used to be tenaciously adhered to even in science, and cannot be undone in the child's mind without a certain amount of shock. In this simple conception there lie the seeds of the reincarnation theory, which, as we know, is still alive today in millions of human beings.²

[7] Just as the birth of a little sister was the turning point in the history of “Little Hans,” so in this case it was the arrival of a baby brother, which took place when Anna had reached the age of four. The problem of where children come from, hardly touched upon so far, now became topical. The mother's pregnancy had apparently passed unnoticed; that is to say, Anna had never made any observations on this subject. On the evening before the birth, when labour pains were just beginning, the child found herself in her father's room. He took her on his knee and said, “Tell me, what would you say if you got a little brother tonight?” “I would kill him,” was the prompt answer. The expression “kill” looks very alarming, but in reality it is quite harmless, for “kill” and “die” in child language only mean to “get rid of,” either actively or passively, as has already been pointed out a number of times by Freud. I once had to treat a fifteen-year-old girl who, under analysis, had a recurrent association, and kept on thinking of Schiller's “Song of the Bell.” She had never really read the poem, but had once glanced through it, and could only remember something about a cathedral tower. She could recall no further details. The passage goes:

From the tower

The bell-notes fall

Heavy and sad
For the funeral. ...

Alas it is the wife and mother,
Little wife and faithful mother,
Whom the dark prince of the shadows
Snatches from her spouse's arms....

- [8] She naturally loved her mother dearly and had no thought of her death, but on the other hand the present position was this: she had to go away with her mother for five weeks, staying with relatives; the year before, the mother had gone by herself, and the daughter (an only and spoilt child) was left at home alone with her father. Unfortunately this year it was the "little wife" who was being snatched from the arms of her spouse, whereas the daughter would greatly have preferred the "faithful mother" to be parted from her child.
- [9] On the lips of a child, therefore, "kill" is a perfectly harmless expression, especially when one knows that Anna used it quite promiscuously for all possible kinds of destruction, removal, demolition, etc. All the same this tendency is worth noting. (Compare the analysis of "Little Hans.")
- [10] The birth occurred in the early morning. When all traces of the birth had been removed, together with the bloodstains, the father went into the room where Anna slept. She awoke as he entered. He told her the news of the arrival of a little brother, which she took with a surprised and tense expression on her face. The father then picked her up and carried her into the bedroom. Anna threw a rapid glance at her rather wan-looking mother and then displayed something like a mixture of embarrassment and suspicion, as if thinking, "What's going to happen now?" She evinced hardly any pleasure at the sight of the new arrival, so that the cool reception she gave it caused general disappointment. For the rest of the morning she kept very noticeably away from her mother; this was the more striking, as normally she was always hanging around her. But once, when her mother was alone, she ran into the room, flung her arms round her neck and whispered hurriedly, "Aren't you going to die now?"
- [11] Something of the conflict in the child's soul is now revealed to us. The stork theory had obviously never caught on properly, but the fruitful rebirth hypothesis undoubtedly had, according to which a person helps a child into life by dying. Mama ought therefore to die. Why, then, should Anna feel any pleasure over the new arrival, of whom she was beginning to feel childishly jealous anyway? Hence, she had to assure herself at a favourable opportunity whether Mama was going to die or not. Mama did not die. With this happy issue, however, the rebirth theory

received a severe setback. How was it now possible to explain little brother's birth and the origins of children in general? There still remained the stork theory, which, though never expressly rejected, had been implicitly waived in favour of the rebirth hypothesis.³ The next attempts at explanation unfortunately remained hidden from the parents, as the child went to stay with her grandmother for a few weeks. From the latter's report, however, it appears that the stork theory was much discussed, there being of course a tacit agreement to support it.

[12] When Anna returned home she again displayed, on meeting her mother, the same mixture of embarrassment and suspicion as after the birth. The impression was quite explicit to both parents, though not explicable. Her behaviour towards the baby was very nice. Meantime a nurse had arrived, who made a deep impression on little Anna with her uniform—an extremely negative impression at first, as she evinced the greatest hostility towards her in all things. Thus nothing would induce her to let herself be undressed in the evenings and put to bed by this nurse. The reason for this resistance soon became clear in a stormy scene by the bedside of the little brother, when Anna shouted at the nurse, "That's not your little brother, he is mine!" Gradually, however, she became reconciled to the nurse and began to play nurse herself; she had to have her white cap and apron, nursing her little brother and her dolls in turn. In contrast to her former mood the present one was unmistakably elegiac and dreamy. She often sat for hours crouched under the table singing long stories to herself and making rhymes, partly incomprehensible, but consisting partly of wishful fantasies on the "nurse" theme ("I am a nurse of the green cross"), and partly of distinctly painful feelings which were struggling for expression.

[13] Here we meet with an important new feature in the little one's life: reveries, the first stirrings of poetry, moods of an elegiac strain—all of them things which are usually to be met with only at a later phase of life, at a time when the youth or maiden is preparing to sever the family tie, to step forth into life as an independent person, but is still inwardly held back by aching feelings of homesickness for the warmth of the family hearth. At such a time they begin weaving poetic fancies in order to compensate for what is lacking. To approximate the psychology of a four-year-old to that of the boy or girl approaching puberty may at first sight seem paradoxical; the affinity lies, however, not in the age but in the mechanism. The elegiac reveries express the fact that part of the love which formerly belonged, and should belong, to a real object, is now *introverted*, that is, it is turned inwards into the subject and there produces an increased fantasy activity.⁴ Whence comes this introversion? Is it a psychological manifestation peculiar to this period, or does it come from a conflict?

[14] On this point the following episode is enlightening. Anna disobeyed her mother more and more often, saying insolently, "I shall go back to Granny!"

“But I shall be sad if you leave me.”

“Ah, but you’ve got baby brother.”

[15] The mother’s reaction shows us what the child was really getting at with her threats to go away again: she obviously wanted to hear what her mother would say to her proposal, what her attitude was in general, and whether the little brother had not ousted her altogether from her mother’s affection. One must not, however, fall for this transparent piece of trickery. The child could see and feel perfectly well that she was not stinted of anything essential in her mother’s love, despite the existence of her baby brother. The veiled reproach she levels at her mother on that score is therefore unjustified, and to the trained ear this is betrayed by the slightly affected tone of voice. One often hears similar tones even with grown-up people. Such a tone, which is quite unmistakable, does not expect to be taken seriously and obtrudes itself all the more forcibly for that reason. Nor should the reproach be taken to heart by the mother, for it is merely the forerunner of other and this time more serious resistances. Not long after the conversation narrated above, the following scene took place:

Mother: “Come, we’ll go into the garden.”

Anna: “You’re lying to me. Watch out if you’re not telling the truth!”

Mother: “What are you thinking of? Of course I’m telling the truth.”

Anna: “No, you are not telling the truth.”

Mother: “You’ll soon see whether I’m telling the truth: we are going into the garden this minute.”

Anna: “Is that true? You’re quite sure it’s true? You’re not lying?”

[16] Scenes of this kind were repeated a number of times. But this time the tone was more vehement and insistent, and also the accent on the word “lie” betrayed something special which the parents did not understand; indeed they attributed far too little significance at first to the child’s spontaneous utterances. In this they were only doing what all official education does. We do not usually listen to children at any stage of their careers; in all the essentials we treat them as *non compos mentis* and in all the unessentials they are drilled to the perfection of automatons. Behind resistances there always lies a question, a conflict, of which we hear soon enough at another time and on another occasion. But usually we forget to connect the thing heard with the resistances. Thus, on another occasion, Anna faced her mother with the awkward questions:

“I want to be a nurse when I grow up.”

“That’s what I wanted to be when I was a child.”

“Why aren’t you a nurse, then?”

“Well, because I am a mother instead, and so I have children of my own to nurse.”

Anna (thoughtfully): “Shall I be a different woman from you? Shall I live in a different place? Shall I still talk with you?”

[17] The mother’s answer again shows where the child’s question was leading.⁵ Anna would obviously like to have a child to nurse, just as the nurse has. Where the nurse got the child from is quite clear, and Anna could get a child in the same way when she grew up. Why then wasn’t Mama such a nurse—that is, how did she get the child if she didn’t get it in the same way as the nurse? Anna could get a child just as the nurse had done, but how all that was going to be different in the future, or rather how she was going to be like her mother in the matter of getting children, was not so easy to see. Hence the thoughtful question “Shall I be a different woman from you?” Shall I be different in every way? The stork theory is evidently no good, the dying theory no less so, therefore one gets a child as the nurse, for example, got hers. In this natural way she, too, could get one; but how about the mother, who is no nurse and yet has children? Looking at the matter from this angle, Anna asks, “Why aren’t you a nurse?”—meaning: why haven’t you got your child in the plain, straightforward, natural way? This strangely indirect mode of interrogation is typical and may be connected with the child’s hazy grasp of the problem, unless we are to assume a certain “diplomatic vagueness” prompted by a desire to evade direct questioning. Later we shall find evidence of this possibility.

[18] Anna is therefore confronted with the question “Where does the child come from?” The stork did not bring it; Mama did not die; nor did Mama get it in the same way as the nurse. She has, however, asked this question before and was informed by her father that the stork brings children; but this is definitely not so, she has never been deceived on this point. Therefore Papa and Mama and all the others lie. This readily explains her mistrustful attitude at the birth and the reproaches levelled against her mother. But it also explains another point, namely the elegiac reveries which we have attributed to a partial introversion. We now know the real object from which love had to be withdrawn and introverted for lack of an aim: it was withdrawn from the parents who deceived her and refused to tell her the truth. (What can this be which must not be uttered? What goes on here? Such are the parenthetic questions which the child later formulated to herself. Answer: It must be something that needs hushing up, perhaps something dangerous.) Attempts to make the mother talk and to draw out the truth by means of artful questions were futile, so resistance meets with resistance and the introversion of love begins. Naturally the capacity for sublimation in a four-year-old child is still too meagrely developed for it to render more than symptomatic service; hence she has to rely on another compensation, that is, she resorts to one of the already abandoned infantile devices for securing love by force, preferably that of crying and calling the mother at night. This had been diligently practised and exploited during her first year. It now returns

and, in keeping with her age, has become well motivated and equipped with recent impressions.

[19] We should mention that the Messina earthquake had just occurred, and this event was much discussed at table. Anna was extraordinarily interested in everything to do with it, getting her grandmother to tell her over and over again how the earth shook and the houses tumbled down and how many people lost their lives. That was the beginning of her nocturnal fears; she could not be left alone, her mother had to go to her and stay with her, otherwise she was afraid that the earthquake would come and the house fall in and kill her. By day, too, she was intensely occupied with such thoughts; when out walking with her mother she would pester her with such questions as “Will the house be standing when we get home? Will Papa still be alive? Are you sure there’s no earthquake at home?” At every stone in the road she would ask whether it was from the earthquake. A house under construction was a house destroyed by the earthquake, and so on. Finally she used to cry out at night that the earthquake was coming, she could hear it rumbling. Every evening she had to be solemnly promised that no earthquake would come. Various ways of calming her were tried, for instance she was told that earthquakes only occur where there are volcanoes. But then she had to be satisfied that the mountains surrounding the town were not volcanoes. This reasoning gradually led the child to an intense and, at her age, unnatural craving for knowledge, until finally all the geological pictures and atlases had to be fetched from her father’s library. For hours she would rummage through them looking for pictures of volcanoes and earthquakes, and asking endless questions.

[20] We see here an energetic attempt being made to sublimate fear into a desire for knowledge, which strikes us as decidedly premature at this age. But how many gifted children, suffering from exactly the same problem, do we not see being spoon-fed on this untimely sublimation, and by no means to their advantage. For if one fosters sublimation at this age one is only strengthening a neurosis. The root of the child’s desire for knowledge is fear, and the fear is the expression of converted libido, that is, of an introversion that has become neurotic and is neither necessary nor favourable to the development of the child at this age. Where this desire for knowledge is ultimately leading is made clear by a series of questions which arose almost daily: “Why is Sophie [a younger sister] younger than I? Where was Freddie [her little brother] before? Was he in heaven and what was he doing there? Why did he only come down now, why not before?”

[21] Such being the state of affairs, the father decided that the mother ought to tell the child the truth about her little brother at the first favourable opportunity.

[22] This presented itself when, soon afterwards, Anna again inquired about the stork. Her mother told her that the story of the stork was not true, but that Freddie grew

inside his mother as the flower grows out of the earth. At first he was very little, and then he grew bigger and bigger like a plant. The child listened attentively without the least surprise and then asked:

“But did he come all by himself?”

“Yes.”

“But he can’t walk yet!”

Sophie: “Then he crawled out.”

Anna (overhearing Sophie’s remark): “Is there a hole here” —pointing to her chest —“or did he come out of the mouth? Who came out of the nurse?”

[23] At this point she interrupted herself and exclaimed, “No, I know the stork brought him down from heaven!” Then, before the mother could answer her questions, she dropped the subject and again asked to see pictures of volcanoes. The evening following this conversation was calm. The sudden explanation had evidently produced in the child a whole chain of ideas, which announced themselves in a spate of questions. New and unexpected vistas were opened, and she rapidly approached the main problem: “Where did the baby come out? Was it from a hole in the chest or from the mouth?” Both suppositions qualify as acceptable theories. We even meet with young married women who still entertain the theory of the hole in the abdominal wall or of Caesarean section; this is supposed to betray a very unusual degree of innocence. As a matter of fact it is not innocence; in such cases we are practically always dealing with infantile sexual activities which in later life have brought the *vias naturales* into ill repute.

[23a] It may be asked where the child got the absurd idea that there is a hole in the chest, or that the birth takes place through the mouth. Why did she not pick on one of the natural openings in the pelvis, from which things come out daily? The explanation is simple. It was not so very long since our little one had challenged all the educative arts of her mother by her heightened interest in both these openings and their remarkable products—an interest not always in accord with the demands of cleanliness and decorum. Then for the first time she became acquainted with the exceptional laws relating to these bodily regions and, being a sensitive child, she soon noticed that there was something taboo about them. Consequently this region had to be left out of her calculations, a trivial error of thought which may be forgiven in a child when one considers all those people who, despite the most powerful spectacles, can never see anything sexual anywhere. In this matter Anna reacted far more docilely than her little sister, whose scatological interests and achievements were certainly phenomenal and who even misbehaved in that way at table. She invariably described her excesses as “funny,” but Mama said no, it was not funny, and forbade such fun. The child seemed to take these incomprehensible educational sallies in good part, but she soon had her revenge. Once when a new

dish appeared on the table she categorically refused to have anything to do with it, remarking that it was “not funny.” Thereafter all culinary novelties were declined on the ground that they were “not funny.”

[24] The psychology of this negativism is quite typical and is not hard to fathom. The logic of feeling says simply: “If you don’t find my little tricks funny and make me give them up, then I won’t find your tricks funny either, and won’t play with you.” Like all childish compensations of this kind, this works on the important infantile principle “It serves you right when I’m hurt.”

[25] After this digression, let us return to our theme. Anna had merely shown herself docile and had so adjusted herself to the cultural demands that she thought (or at least spoke) of the simplest things last. The incorrect theories that have been substituted for the correct ones sometimes persist for years, until brusque enlightenment comes from without. It is therefore no wonder that such theories, the formation of and adherence to which is favoured even by parents and educationists, should later become determinants of important symptoms in a neurosis, or of delusions in a psychosis, as I have shown in my “Psychology of Dementia Praecox.”⁶ Things that have existed in the psyche for years always remain somewhere, even though they may be hidden under compensations of a seemingly different nature.

[26] But even before the question is settled as to where the child actually comes out a new problem obtrudes itself: children come out of Mama, but how about the nurse? Did someone come out of her too? Then follows the abrupt exclamation, “No, I know the stork brought him down from heaven!” What is there so peculiar about the fact that nobody came out of the nurse? We recall that Anna has identified herself with the nurse and plans to become a nurse later, for she too would like to have a child, and she could get one just as easily as the nurse had done. But now, when it is known that little brother grew in Mama, what is to be done?

[27] This disquieting question is averted by a quick return to the stork-angel theory, which had never really been believed and which after a few trials is definitely abandoned. Two questions, however, remain in the air. The first is: where does the child come out? and the second, a considerably more difficult one: how is it that Mama has children while the nurse and the servants do not? Neither question is asked for the time being.

[28] The next day at lunch, Anna announced, apparently out of the blue, “My brother is in Italy and has a house made of cloth and glass and it doesn’t fall down.”

[29] Here as always it was impossible to ask for an explanation; the resistances were too great, and Anna would not have let herself be pinned down. This unique and rather officious announcement is very significant. For some three months the children had been spinning a stereotyped fantasy of a “big brother” who knew

everything, could do everything, and had everything. He had been to all the places where they had not been, was allowed to do all the things they were not allowed to do, was the owner of enormous cows, horses, sheep, dogs, etc.⁷ Each of them had such a big brother. The source of this fantasy is not far to seek: its model is the father, who seems to be rather like a brother to Mama. So the children too must have an equally powerful brother. This brother is very brave, he is at present in dangerous Italy and lives in an impossibly fragile house which does not fall down. For the child this is an important wish-fulfilment: the earthquake is no longer dangerous. In consequence the fear and anxiety were banished and did not return. The fear of earthquakes now entirely disappeared. Instead of calling her father to her bedside every evening to conjure away the fear, she now became more affectionate and begged him to kiss her good night. In order to test this new state of affairs, the father showed her more pictures of volcanoes and earthquakes, but Anna remained indifferent and examined the pictures coldly: "Dead people! I've seen all that before." Even the photograph of a volcanic eruption no longer held any attractions for her. Thus all her scientific interest collapsed and vanished as suddenly as it had come. However, during the days that followed her enlightenment Anna had more important matters to attend to, for she had her newly found knowledge to disseminate among her circle of acquaintances. She began by recounting, at great length, how Freddie had grown in Mama, and herself and her younger sister likewise; how Papa grew in *his* mother and Mama in *her* mother, and the servants in their respective mothers. By dint of numerous questions she also tested whether her knowledge was firmly founded in truth, for her suspicions had been aroused in no small degree, so that repeated corroboration was needed to dissipate all her misgivings. In between times the children brought up the stork-angel theory again, but in a less believing tone, and even lectured the dolls in a singsong voice.

[30] The new knowledge, however, obviously held its ground, for the phobia did not return.

[31] Only once did her certainty threaten to go to pieces. About a week after the enlightenment her father had to spend the morning in bed with an attack of influenza. The children knew nothing of this, and Anna, coming into her parents' bedroom, saw the unexpected sight of her father lying in bed. She made an oddly surprised face, remained standing far away from the bed, and would not come nearer, evidently feeling shy and mistrustful again. Suddenly she burst out with the question "Why are you in bed? Have you got a plant in your inside too?"

[32] Naturally her father had to laugh, and assured her that children never grew in their fathers, that as a matter of fact men did not have children, but only women, whereupon the child instantly became friendly again. But though the surface was

calm the problems went on working in the depths. A few days later Anna again announced at lunch, “I had a dream last night about Noah’s Ark.” The father then asked her what she had dreamed, to which Anna only let out a stream of nonsense. In such cases one must simply wait and pay attention. Sure enough, after a few minutes Anna said to her grandmother, “I had a dream last night about Noah’s Ark and there were lots of little animals in it.” Another pause. Then she began the story for the third time: “*I had a dream last night about Noah’s Ark and there were lots of little animals in it and underneath there was a lid which opened and all the little animals fell out.*” Knowledgeable persons will understand the fantasy. The children really did have a Noah’s Ark, but the opening, a lid, was in the roof and not underneath. This is a delicate hint that the story about children being born from the mouth or chest was wrong, and that she had a pretty good idea of where they did come out—namely, from underneath.

[33] Several weeks now passed without any noteworthy occurrences. There was one dream: “*I dreamt about Papa and Mama, they were sitting up late in the study and we children were there too.*”

[34] On the face of it this is just the well-known wish of children to be allowed to stay up as long as the parents. This wish is here realized, or rather it is used to mask a much more important wish, the wish to be present in the evenings when the parents are alone, and—naturally and innocently enough—in the *study* where she had seen all those interesting books and had satisfied her thirst for knowledge. In other words, she was really seeking an answer to the burning question of where little brother came from. If the children were there they would find out.

[35] A few days later Anna had a nightmare, from which she awoke screaming, “The earthquake is coming, the house is beginning to shake!” Her mother went to her and comforted her, saying that there was no earthquake, everything was quiet and everybody was asleep. Then Anna said in an urgent tone, “I’d just like to see the spring, how all the little flowers come out and how all the fields are full of flowers; I want to see Freddie, he has such a dear little face. What is Papa doing—what did he say?” Her mother told her he was asleep and hadn’t said anything. Anna then remarked, with a sarcastic smile, “He will probably be sick again in the morning!”

[36] This text must be read backwards. The last sentence is not intended seriously, as it was uttered in a sarcastic tone of voice. The last time father was sick Anna suspected him of having “a plant in his inside.” The sarcasm therefore means “He will probably have a child in the morning!” But this is not intended seriously, for Papa cannot have a child, only Mama has children; perhaps she will have another tomorrow, but where from? “What is Papa doing?” Here we have an unmistakable formulation of the difficult problem: what does Papa do if he does not produce children? Anna would very much like to find the clue to all her problems; she would

like to know how Freddie came into the world, she would like to see how the flowers come out of the earth in the spring, and these wishes all hide behind her fear of earthquakes.

[37] After this intermezzo Anna slept peacefully until morning. In the morning her mother asked her what was the matter with her last night. Anna had forgotten everything and thought she had only had a dream: “*I dreamt I could make the summer and then someone threw a golliwog down the toilet.*”

[38] This singular dream is made up of two different scenes, which are separated by the word “then.” The second part derives its material from a recent wish to have a golliwog, i.e., to have a masculine doll just as Mama has a little boy. Someone throws the golliwog down the toilet—but usually one lets quite other things drop down the toilet. The inference is that children come out just like the things into the toilet. Here we have an analogy to the *Lumpf*-theory of Little Hans. Whenever several scenes are found in one dream, each scene ordinarily represents a special variation of the working out of the complex. Thus the first part is only a variation of the theme found in the second part. We have noted above what is meant by “seeing the spring” or “seeing the flowers come out.” Anna now dreams that she *can make the summer*, i.e., can cause the flowers to come out; she herself can make a little child, and the second part of the dream represents this as analogous to the making of a motion. Here we put our finger on the egoistic wish which lies behind the seemingly objective interest of the previous night’s conversation.

[39] A few days later the mother received a visit from a lady who was looking forward to her confinement. The children apparently noticed nothing. But the next day they amused themselves, under the guidance of the elder girl, by taking all the old newspapers out of their father’s waste-paper basket and stuffing them under their frocks in front, so that the imitation was unmistakable. That night Anna again had a dream: “*I dreamt about a lady in the town, she had a very fat stomach.*” As the chief actor in a dream is always the dreamer himself under a definite aspect, the game of the day before finds complete interpretation,

[40] Not long after, Anna surprised her mother with the following performance: she stuck her doll under her clothes and slowly pulled it out head downwards, saying, “Look, the baby is coming out, now it is all out.” Anna was telling her mother: thus I conceive the problem of birth. What do you think of it? is it right? The game is really meant as a question, for, as we shall see later, this conception still had to be officially confirmed.

[41] Rumination on the problem by no means ended here, as is apparent from the ideas Anna conceived during the following weeks. Thus she repeated the same game a few days later with her Teddy bear, which had the function of a specially beloved doll. Another day, pointing to a rose, she said to her grandmother, “Look, the rose is

getting a baby.” As the grandmother did not quite take her meaning, the child pointed to the swollen calyx: “Don’t you see, it’s all fat here!”

[42] One day she was quarrelling with her younger sister, when the latter exclaimed angrily, “I’ll kill you!” Whereupon Anna replied, “When I am dead you will be all alone, and then you’ll have to pray to God for a live baby.” And immediately the scene changed: Anna was the angel, and the younger sister had to kneel down before her and beg her to send a living child. In this way Anna became the child-giving mother.

[43] Once they had oranges for supper. Anna impatiently asked for one and said, “I’ll take an orange and I’ll swallow it all down into my stomach, and then I shall get a baby.”

[44] This instantly reminds us of the fairytales in which childless women finally make themselves pregnant by swallowing fruit, fish and the like.⁸ Anna was here trying to solve the problem of how children actually get into the mother. In so doing she takes up a position of inquiry which had never been formulated before so precisely. The solution follows in the form of an analogy, which is characteristic of the archaic thinking of the child. (Thinking in analogies is also found in the adult, in the stratum lying immediately below consciousness. Dreams bring the analogies to the surface, as also does dementia praecox.) In German and numerous other foreign fairytales one frequently finds such childish comparisons. Fairytales seem to be the myths of childhood and they therefore contain among other things the mythology which children weave for themselves concerning sexual processes. The poetry of fairytale, whose magic is felt even by the adult, rests not least upon the fact that some of the old theories are still alive in our unconscious. We experience a strange and mysterious feeling whenever a fragment of our remotest youth stirs into life again, not actually reaching consciousness, but merely shedding a reflection of its emotional intensity on the conscious mind.

[45] The problem of how the child gets into the mother is a difficult one to solve. As the only way of getting things into the body is through the mouth, it stands to reason that the mother ate something like a fruit, which then grew inside her. But here another difficulty presents itself: one knows what comes out of the mother, but what is the use of the father? Now, it is an old rule of the mental economy to connect two unknowns and to use one to solve the other.

[46] Hence the conviction rapidly fastened on the child that the father is somehow involved in the whole business, particularly in view of the fact that the problem of where children come from still leaves the question open of how they get into the mother.

[47] What does the father do? This question occupied Anna to the exclusion of all else. One morning she ran into her parents’ bedroom while they were still dressing,

jumped into her father's bed, lay flat on her face, and flailed with her legs, crying out, "Look, is that what Papa does?" Her parents laughed and did not answer, as it only dawned on them afterwards what this performance probably signified. The analogy with the horse of Little Hans, which made such a commotion with its legs, is surprisingly close.

[48] Here, with this latest achievement, the matter seemed to rest; at any rate the parents found no opportunity to make any pertinent observations. That the problem should come to a standstill at this point is not really surprising, for this is the most difficult part. The child knows nothing about sperms and nothing about coitus. There is but one possibility: the mother must eat something, for only in that way can anything get into the body. But what does the father do? The frequent comparisons with the nurse and other unmarried people were obviously to some purpose. Anna was bound to conclude that the existence of the father was in some way significant. But what on earth does he do? Anna and Little Hans are agreed that it must have something to do with the legs.

[49] This standstill lasted about five months, during which time no phobias or any other signs of a working through of the complex appeared. Then came the first premonition of future events. Anna's family were at that time living in a country house near a lake, where the children could bathe with their mother. As Anna was afraid to go more than knee-deep into the water, her father once took her right in with him, which led to a great outburst of crying. That evening, when going to bed, Anna said to her mother, "Papa wanted to drown me, didn't he?"

[50] A few days later there was another outburst. She had continued to stand in the gardener's way until finally, for a joke, he picked her up and put her in a hole he had just dug. Anna started to cry miserably, and declared afterwards that the man had tried to bury her.

[51] The upshot was that Anna woke up one night with fearful screams. Her mother went to her in the adjoining room and quieted her. Anna had dreamed that "*a train went by overhead and fell down.*"

[52] Here we have a parallel to the "stage coach" story of Little Hans. These incidents show clearly enough that fear was again in the air, i.e., that there was some obstacle preventing the transference of love to the parents and that therefore a large part of it was converted into fear. This time the mistrust was directed not against the mother, but against the father, who she was sure must know the secret, but would never let anything out. What could the father be doing or keeping up his sleeve? To the child this secret appeared to be something very dangerous, so obviously she felt that the worst might be expected of the father. (This childish fear of the father is to be seen particularly clearly in adults in cases of dementia praecox, which takes the lid off many unconscious processes as though it were acting on psychoanalytical

principles.) Hence Anna arrived at the apparently nonsensical notion that her father wanted to drown her.

[53] Meanwhile Anna had grown a little older and her interest in her father took on a special tinge which is rather hard to describe. Language has no words for the peculiar kind of tender curiosity that shone in the child's eyes.

[54] It is probably no accident that the children began playing a pretty game about this time. They called the two biggest dolls their "grandmothers" and played at hospital with them, a tool-shed being taken over as a hospital. There the grandmothers were brought, interned, and left to sit overnight. "Grandmother" in this connection is distinctly reminiscent of the "big brother" earlier. It seems very likely that the "grandmother" deputizes for the mother. So the children were already conspiring to get the mother out of the way.⁹ This intention was assisted by the fact that the mother had again given Anna cause for displeasure.

[55] It came about in the following way: The gardener had laid out a large bed which he was sowing with grass. Anna helped him in this work with much pleasure, apparently without guessing the profound significance of her childish play. About a fortnight later she began to observe with delight the young grass sprouting. On one of these occasions she went to her mother and asked, "How did the eyes grow into the head?"

[56] Her mother told her she didn't know. But Anna went on to ask whether God knew, or her father, and why God and her father knew everything? The mother then referred her to her father, who might be able to tell her how the eyes grew into the head. Some days later there was a family gathering at tea. After the meal had broken up, the father remained at the table reading the paper, and Anna also stayed behind. Suddenly approaching her father she said, "Tell me, how did the eyes grow into the head?"

Father: "They did not grow into the head; they were there from the beginning and grew with the head."

Anna: "Weren't the eyes planted?"

Father: "No, they just grew in the head like the nose."

Anna: "But did the mouth and the ears grow like that? And the hair?"

Father: "Yes, they all grew the same way."

Anna: "Even the hair? But the baby mice come into the world all naked. Where was the hair before? Aren't there little seeds for it?"

Father: "No. The hair, you see, comes out of little granules which are like seeds, but they are already in the skin and nobody sowed them there."

[57] The father was now getting into a fix. He guessed where the little one was leading him, therefore he did not want to upset, on account of a single false application, the

diplomatically introduced seed theory which she had most fortunately picked up from nature; for the child spoke with an unwonted earnestness which compelled consideration.

[58] Anna (visibly disappointed, and in a distressed voice): “But how did Freddie get into Mama? Who stuck him in? And who stuck you into your mama? Where did he come out?”

[59] From this sudden storm of questions the father chose the last for his first answer:

“Think, now, you know that Freddie is a boy; boys grow into men and girls into women, and only women can have children. Now, just think, where could Freddie have come out?”

Anna (laughing joyfully and pointing to her genitals): “Did he come out here?”

Father: “But of course. Surely you must have thought of that before?”

Anna (overlooking the question): “But how did Freddie get into Mama? Did anybody plant him? Was the seed sown?”

[60] This extremely precise question could no longer be evaded by the father. He explained to the child, who listened with the greatest attention, that the mother is like the soil and the father like the gardener; that the father provides the seed which grows in the mother and thus produces a baby. This answer gave her extraordinary satisfaction; she immediately ran to her mother and said, “Papa has told me everything, now I know it all.” But what it was she knew, she never told to anyone.

[61] The new knowledge was, however, put into practice the following day. Anna went up to her mother and said brightly: “Just think, Mama, Papa told me that Freddie was a little angel and was brought down from heaven by the stork.” Her mother was naturally astounded, and said, “I am quite certain your father never told you anything of the sort.” Whereupon the little one skipped away laughing.

[62] This was her revenge. Her mother evidently would not or could not tell her how the eyes grew into the head; she didn't even know how Freddie had got into her. Therefore she could easily be led up the garden path with that old story about the stork. She might believe it still.

* * *

[63] The child was now satisfied, for her knowledge had been enriched and a difficult problem solved. An even greater advantage, however, was the fact that she had won a more intimate relationship with her father, which did not prejudice her intellectual independence in the least. The father of course was left with an uneasy feeling, for he was not altogether happy about having passed on to a four-and-a-half-year-old child a secret which other parents carefully guard. He was disquieted by the thought of what Anna might do with her knowledge. What if she was indiscreet and exploited it? She might so easily instruct her playmates or gleefully play the *enfant*

terrible with grown-ups. But these fears proved to be groundless. Anna never breathed a word about it, either then or at any time. The enlightenment had, moreover, brought a complete silencing of the problem, so that no more questions presented themselves. Yet the unconscious did not lose sight of the riddle of human creation. A few weeks after her enlightenment Anna recounted the following dream: *She was “in the garden and several gardeners stood making wee-wee against the trees, and Papa was also doing it.”*

[64] This recalls the earlier unsolved problem: what does the father do?

[65] Also about this time a carpenter came into the house in order to repair an ill-fitting cupboard; Anna stood by and watched him planing the wood. That night she dreamt that the carpenter “planed off” her genitals.

[66] The dream could be interpreted to mean that Anna was asking herself: will it work with me? oughtn't one to do something like what the carpenter did, in order to make it work? Such an hypothesis would indicate that this problem is particularly active in the unconscious at the moment, because there is something not quite clear about it. That this is so was shown by the next incident, which did not, however, occur until several months later, when Anna was approaching her fifth birthday. Meantime the younger sister, Sophie, was taking a growing interest in these matters. She had been present when Anna received enlightenment at the time of the earthquake phobia, and had even thrown in an apparently understanding remark on that occasion, as the reader may remember. But in actual fact the explanation was not understood by her at the time. This became clear soon afterwards. She had days when she was more than usually affectionate with her mother and never left her skirts; but she could also be really naughty and irritable. On one of these bad days she tried to tip her little brother out of the pram. Her mother scolded her, whereupon she set up a loud wailing. Suddenly, in the midst of her tears, she said, “I don't know anything about where children come from!” She was then given the same explanation that her elder sister had received earlier. This seemed to allay the problem for her, and for several months there was peace. Then once more there were days when she was whining and bad-tempered. One day, quite out of the blue, she turned to her mother with the question “Was Freddie really in your inside?”

Mother: “Yes.”

Sophie: “Did you push him out?”

Mother: “Yes.”

Anna (butting in): “But was it down below?”

[67] Here Anna employed a childish term which is used for the genitals as well as for the anus.

Sophie: “And then you let him drop down?”

[68] The expression “drop down” comes from that toilet mechanism, of such absorbing interest to children, whereby one lets the excreta drop down into the bowl.

Anna: “Or was he sicked up?”

[69] The evening before, Anna had been sick owing to a slightly upset stomach.

[70] After a pause of several months Sophie had suddenly caught up and now wished to make sure of the explanation previously vouchsafed to her. This making doubly sure seems to indicate that doubts had arisen concerning the explanation given by her mother. To judge by the content of the questions, the doubts arose because the process of birth had not been adequately explained. “Push” is a word children sometimes use for the act of defecation. It tells us along what lines the theory will develop with Sophie, too. Her further remark, as to whether one had let Freddie “drop down,” betrays such a complete identification of her baby brother with excrement that it borders on the ludicrous. To this Anna makes the singular remark that perhaps Freddie was “sicked up.” Her own vomiting of the day before had made a deep impression on her. It was the first time she had been sick since her earliest childhood. That was one way in which things could leave the body, though she had obviously not given it serious thought until now. (Only once had it occurred to her, and that was when they were discussing the body openings and she had thought of the mouth.) Her remark is a firm pointer away from the excrement theory. Why did she not point at once to the genitals? Her last dream gives us a clue to the probable reasons: there is something about the genitals which Anna still does not understand; something or other has to be done there to make it “work.” Maybe it wasn’t the genitals at all; maybe the seed for little children got into the body through the mouth, like food, and the child came out like “sick.”

[71] The detailed mechanism of birth, therefore, was still puzzling. Anna was again told by her mother that the child really does come out down below. About a month later, Anna suddenly had the following dream: *“I dreamt I was in the bedroom of Uncle and Auntie. Both of them were in bed. I pulled the bedclothes off Uncle, lay on his stomach, and joggled up and down on it.”*

[72] This dream came like a bolt from the blue. The children were then on holiday for several weeks and the father, who had been detained in town on business, had arrived on that same day for a visit. Anna was especially affectionate with him. He asked her jokingly, “Will you travel up to town with me this evening?” Anna: “Yes, and then I can sleep with you?” All this time she hung lovingly on her father’s arm as her mother sometimes did. A few moments later she brought out her dream. Some days previously she had been staying as a guest with the aunt mentioned in the dream (the dream, too, was some days old). She had looked forward particularly to that visit, because she was certain she would meet two small cousins—boys—in whom she showed an unfeigned interest. Unfortunately, the cousins were not there,

and Anna was very disappointed. There must have been something in her present situation that was related to the content of the dream for it to be remembered so suddenly. The relation between the manifest content and the conversation with her father is clear enough. The uncle was a decrepit old gentleman and only known to the child from a few rare encounters. In the dream he is patently a substitute for her father. The dream itself creates a substitute for the disappointment of the day before: she is in bed with her father. Here we have the *tertium comparationis* with the present. Hence the sudden remembrance of the dream. The dream recapitulates a game which Anna often played in her father's (empty) bed, the game of joggling about and kicking with her legs on the mattress. From this game stemmed the question "Is this what Papa does?" Her immediate disappointment is that her father answered her question with the words, "You can sleep by yourself in the next room." Then follows the remembrance of the same dream which has already consoled her for a previous erotic disappointment (with the cousins). At the same time the dream is essentially an illustration of the theory that "it" takes place in bed, and by means of the aforementioned rhythmical movements. Whether the remark that she lay on her uncle's stomach had anything to do with her being sick cannot be proved.

[73] Such is the extent of our observations up to the present. Anna is now a little over five years old and already in possession, as we have seen, of a number of the most important sexual facts. Any adverse effect of this knowledge upon her morals and character has yet to be observed. Of the favourable therapeutic effect we have spoken already. It is also quite clear from the report that the younger sister is in need of a special explanation for herself, as and when the problem arises for her. If the time is not ripe, no amount of enlightenment, it would seem, is of the slightest use.

[74] I am no apostle of sex education for schoolchildren, or indeed of any standardized mechanical explanations. I am therefore not in a position to offer any positive and uniformly valid advice. I can only draw one conclusion from the material here recorded, which is, that we should try to see children as they really are, and not as we would wish them; that, in educating them, we should follow the natural path of development, and eschew dead prescriptions.

Supplement

[75] As already mentioned in the foreword, our views have undergone a considerable change since this paper was first published. There is, in the observations, one point in particular which has not been sufficiently appreciated, namely the fact that again and again, despite the enlightenment they received, the children exhibited a distinct preference for some fantastic explanation. Since the first appearance of the present

work this tendency, contrary to my expectations, has increased: the children continue to favour a fantastic theory. In this matter I have before me a number of incontestable observations, some of them concerning the children of other parents. The four-year-old daughter of one of my friends, for instance, who does not hold with useless secrecy in education, was allowed last year to help her mother decorate the Christmas tree. But this year the child told her mother, "It wasn't right last year. This time I'll not look and you will lock the door with the key."

[76] As a result of this and similar observations, I have been left wondering whether the fantastic or mythological explanation preferred by the child might not, for that very reason, be more suitable than a "scientific" one, which, although factually correct, threatens to clamp down the latch on fantasy for good. In the present instance the latch could be unclamped again, but only because the fantasy brushed "science" aside.

[77] Did their enlightenment harm the children? Nothing of the sort was observed. They developed healthily and normally. The problems they broached apparently sank right into the background, presumably as a result of the manifold external interests arising out of school life, and the like. The fantasy activity was not harmed in the least, nor did it pursue paths that could be described as in any way abnormal. Occasional remarks or observations of a delicate nature were made openly and without secrecy.

[78] I have therefore come to hold the view that the earlier free discussions took the wind out of the children's imagination and thus prevented any secretive fantasy from developing which would have cast a sidelong glance at these things, and would, in consequence, have been nothing but an obstacle to the free development of thinking. The fact that the fantasy activity simply ignored the right explanation seems, in my view, to be an important indication that all freely developing thought has an irresistible need to emancipate itself from the realism of fact and to create a world of its own.

[79] Consequently, however little advisable it is to give children false explanations which would only sow the seeds of mistrust, it is, so it seems to me, no less inadvisable to insist on the acceptance of the right explanation. For the freedom of the mind's development would merely be suppressed through such rigid consistency, and the child forced into a concretism of outlook that would preclude further development. Side by side with the biological, the spiritual, too, has its inviolable rights. It is assuredly no accident that primitive peoples, even in adult life, make the most fantastic assertions about well-known sexual processes, as for instance that coitus has nothing to do with pregnancy.¹⁰ From this it has been concluded that these people do not even know there is such a connection. But more accurate investigation has shown that they know very well that with animals

copulation is followed by pregnancy. Only for human beings is it denied—not *not known*, but flatly *denied*—that this is so, for the simple reason that they prefer a mythological explanation which has freed itself from the trammels of concretism. It is not hard to see that in these facts, so frequently observed among primitives, there lie the beginnings of *abstraction*, which is so very important for culture. We have every reason to suppose that this is also true of the psychology of the child. If certain South American Indians really and truly call themselves red cockatoos and expressly repudiate a figurative interpretation of this fact, this has absolutely nothing to do with any sexual repression on “moral” grounds, but is due to the law of independence inherent in the thinking function and to its emancipation from the concretism of sensuous perceptions. We must assign a separate principle to the thinking function, a principle which coincides with the beginnings of sexuality only in the polyvalent germinal disposition of the very young child. To reduce the origins of thinking to mere sexuality is an undertaking that runs counter to the basic facts of human psychology.

INTRODUCTION TO WICKES'S "ANALYSE DER KINDERSEELE"

INTRODUCTION TO WICKES'S "ANALYSE DER KINDERSEELE"¹

- [80] What this book provides is not theory, but experience. That is just what gives it its special value for anyone really interested in child psychology. We cannot fully understand the psychology of the child or that of the adult if we regard it as the subjective concern of the individual alone, for almost more important than this is his relation to others. Here, at all events, we can begin with the most easily accessible and, practically speaking, the most important part of the psychic life of the child. Children are so deeply involved in the psychological attitude of their parents that it is no wonder that most of the nervous disturbances in childhood can be traced back to a disturbed psychic atmosphere in the home. This book shows, from a series of remarkable examples, just how disastrous the parental influence can be for the child. Probably no father or mother will be able to read these chapters without realizing the devastating truths of this book. *Exempla docent*—example is the best teacher! Once more this proves to be a well-worn yet pitiless truth. It is not a question of good and wise counsels, but solely of deeds, of the actual life of the parents. Nor is it a matter of living in accordance with accepted moral values, for the observance of customs and laws can very easily be a cloak for a lie so subtle that our fellow human beings are unable to detect it. It may help us to escape all criticism, we may even be able to deceive ourselves in the belief of our obvious righteousness. But deep down, below the surface of the average man's conscience, he hears a voice whispering, "There is something not right," no matter how much his rightness is supported by public opinion or by the moral code. Certain instances in this book show very clearly that there exists a terrible law which stands beyond man's morality and his ideas of rightness—a law which cannot be cheated.
- [81] Besides the problem of environmental influence, the book also gives due weight to psychic factors which have more to do with the irrational values of the child than with his rational psychology. The latter can be made the object of scientific research, while the spiritual values, the qualities of the soul, elude purely intellectual treatment. It is no good having sceptical ideas about this—nature does not care a pin for our ideas. If we have to deal with the human soul we can only meet it on its own ground, and we are bound to do so whenever we are confronted with the real and crushing problems of life.
- [82] I am glad the author has not shrunk from opening the door to intellectual criticism. Genuine experience has nothing to fear from objections, whether justified or unjustified, for it always holds the stronger position.

[83] Although this book does not pretend to be “scientific,” it is scientific in a higher sense, because it gives a true picture of the difficulties that actually occur in the upbringing of children. It merits the serious attention of everybody who has anything to do with children, either by vocation or from duty. But it will also be of interest to those who, neither for reasons of duty nor from educational inclination, wish to know more about the beginnings of human consciousness. Even though many of the views and experiences set forth in this book have nothing fundamentally new to offer to the doctor and psychological educator, the curious reader will now and then come upon cases which are strange and will give pause to his critical understanding—cases and facts which the author, with her essentially practical turn of mind, does not pursue in all their complexities and theoretical implications. What is the thoughtful reader to make, for instance, of the puzzling but undeniable fact of the identity of the psychic state of the child with the unconscious of the parents? One is dimly aware here of a region full of incalculable possibilities, a hydra-headed monster of a problem that is as much the concern of the biologist and psychologist as of the philosopher. For anyone acquainted with the psychology of primitives there is an obvious connection between this “identity” and Lévy-Bruhl’s idea of “participation mystique.” Strange to say, there are not a few ethnologists who still kick against this brilliant idea, for which the unfortunate expression “mystique” may have to shoulder no small part of the blame. The word “mystical” has indeed become the abode of all unclean spirits, although it was not meant like that originally, but has been debased by sordid usage. There is nothing “mystical” about identity, any more than there is anything mystical about the metabolism common to mother and embryo. Identity derives essentially from the notorious unconsciousness of the small child. Therein lies the connection with the primitive, for the primitive is as unconscious as a child. Unconsciousness means non-differentiation. There is as yet no clearly differentiated ego, only events which may belong to me or to another. It is sufficient that *somebody* should be affected by them. The extraordinary infectiousness of emotional reactions then makes it certain that everybody in the vicinity will involuntarily be affected. The weaker ego-consciousness is, the less it matters who is affected, and the less the individual is able to guard against it. He could only do that if he could say: you are excited or angry, but I am not, for I am not you. The child is in exactly the same position in the family: he is affected to the same degree and in the same way as the whole group.

[84] For all lovers of theory, the essential fact behind all this is that the things which have the most powerful effect upon children do not come from the conscious state of the parents but from their unconscious background. For the ethically minded person who may be a father or mother this presents an almost frightening problem, because the things we can manipulate more or less, namely consciousness and its

contents, are seen to be ineffectual in comparison with these uncontrollable effects in the background, no matter how hard we may try. One is afflicted with a feeling of extreme moral uncertainty when one takes these unconscious processes with the seriousness they deserve. How are we to protect our children from ourselves, if conscious will and conscious effort are of no avail? There can be no doubt that it is of the utmost value for parents to view their children's symptoms in the light of their own problems and conflicts. It is their duty as parents to do so. Their responsibility in this respect carries with it the obligation to do everything in their power not to lead a life that could harm the children. Generally far too little stress is laid upon how important the conduct of the parents is for the child, because it is not words that count, but deeds. Parents should always be conscious of the fact that they themselves are the principal cause of neurosis in their children.

[85] We must not, however, exaggerate the importance of unconscious effects, even though the mind's love of causes finds dangerous satisfaction in doing precisely this. Nor should we exaggerate the importance of causality in general. Certainly causes exist, but the psyche is not a mechanism that reacts of necessity and in a regular way to a specific stimulus. Here as elsewhere in practical psychology we are constantly coming up against the experience that in a family of several children only one of them will react to the unconscious of the parents with a marked degree of identity, while the others show no such reaction. The specific constitution of the individual plays a part here that is practically decisive. For this reason, the biologically trained psychologist seizes upon the fact of organic heredity and is far more inclined to regard the whole mass of genealogical inheritance as the elucidating factor, rather than the psychic causality of the moment. This standpoint, however satisfying it may be by and large, is unfortunately of little relevance to individual cases because it offers no practical clue to psychological treatment. For it also happens to be true that psychic causality exists between parents and children regardless of all the laws of heredity; in fact, the heredity point of view, although undoubtedly justified, diverts the interest of the educator or therapist away from the practical importance of parental influence to some generalized and more or less fatalistic regard for the dead hand of heredity, from the consequences of which there is no escape.

[86] It would be a very grave omission for parents and educators to ignore psychic causality, just as it would be a fatal mistake to attribute all the blame to this factor alone. In every case both factors have a part to play, without the one excluding the other.

[87] What usually has the strongest psychic effect on the child is the life which the parents (and ancestors too, for we are dealing here with the age-old psychological phenomenon of original sin) have not lived. This statement would be rather too

perfunctory and superficial if we did not add by way of qualification: that part of their lives which *might have been* lived had not certain somewhat threadbare excuses prevented the parents from doing so. To put it bluntly, it is that part of life which they have always shirked, probably by means of a pious lie. That sows the most virulent germs.

[88] Our author's exhortation to clear-eyed self-knowledge is therefore altogether appropriate. The nature of the case must then decide how much of the blame really rests with the parents. One should never forget that it is a question of "original sin," a sin against life and not a contravention of man-made morality, and that the parents must therefore be viewed as children of the grandparents. The curse of the House of Atreus is no empty phrase.

[89] Nor should one fall into the error of thinking that the form or intensity of the child's reaction necessarily depends upon the peculiar nature of the parent's problems. Very often these act as a catalyst and produce effects which could be better explained by heredity than by psychic causality.

[90] The causal significance of parental problems for the psyche of the child would be seriously misunderstood if they were always interpreted in an exaggeratedly personal way as moral problems. More often we seem to be dealing with some fate-like ethos beyond the reach of our conscious judgment. Such things as proletarian inclinations in the scions of noble families, outbursts of criminality in the offspring of the respectable or over-virtuous, a paralysing or impassioned laziness in the children of successful business men, are not just bits of life that have been left deliberately un-lived, but compensations wrought by fate, functions of a natural ethos which casts down the high and mighty and exalts the humble. Against this neither education nor psychotherapy is of any avail. The most they can do, if reasonably applied, is to encourage the child to fulfil the task imposed upon him by the natural ethos. The guilt of the parents is impersonal, and the child should pay for it no less impersonally.

[91] Parental influence only becomes a moral problem in face of conditions which might have been changed by the parents, but were not, either from gross negligence, slothfulness, neurotic anxiety, or soulless conventionality. In this matter a grave responsibility often rests with the parents. And nature has no use for the plea that one "did not know."

[92] Not knowing acts like guilt.

[93] Frances Wickes's book also raises the following problem in the mind of the thoughtful reader:

The psychology of "identity," which precedes ego-consciousness, indicates what the child is by virtue of his parents. But what he is as an individuality distinct from his parents can hardly be explained by the causal relationship to the parents. We

ought rather to say that it is not so much the parents as their ancestors—the grandparents and great-grandparents—who are the true progenitors, and that these explain the individuality of the children far more than the immediate and, so to speak, accidental parents. In the same way the true psychic individuality of the child is something new in respect of the parents and cannot be derived from their psyche. It is a combination of collective factors which are only potentially present in the parental psyche, and are sometimes wholly invisible. Not only the child's body, but his soul, too, proceeds from his ancestry, in so far as it is individually distinct from the collective psyche of mankind.

[94] The child's psyche, prior to the stage of ego-consciousness, is very far from being empty and devoid of content. Scarcely has speech developed when, in next to no time, consciousness is present; and this, with its momentary contents and its memories, exercises an intensive check upon the previous collective contents. That such contents exist in the child who has not yet attained to ego-consciousness is a well-attested fact. The most important evidence in this respect is the dreams of three- and four-year-old children, among which there are some so strikingly mythological and so fraught with meaning that one would take them at once for the dreams of grown-ups, did one not know who the dreamer was. They are the last vestiges of a dwindling collective psyche which dreamingly reiterates the perennial contents of the human soul. From this phase there spring many childish fears and dim, unchildlike premonitions which, rediscovered in later phases of life, form the basis of the belief in reincarnation. But from this sphere also spring those flashes of insight and lucidity which give rise to the proverb: Children and fools speak the truth.

[95] Because of its universal distribution the collective psyche, which is still so close to the small child, perceives not only the background of the parents, but, ranging further afield, the depths of good and evil in the human soul. The unconscious psyche of the child is truly limitless in extent and of incalculable age. Behind the longing to be a child again, or behind the anxiety dreams of children, there is, with all due respect to the parents, more than the joys of the cradle or a bad upbringing.

[96] Primitive peoples often hold the belief that the soul of the child is the incarnation of an ancestral spirit, for which reason it is dangerous to punish children, lest the ancestral spirit be provoked. This belief is only a more concrete formulation of the views I have outlined above.

[97] The infinity of the child's preconscious soul may disappear with it, or it may be preserved. The remnants of the child-soul in the adult are his best and worst qualities; at all events they are the mysterious *spiritus rector* of our weightiest deeds and of our individual destinies, whether we are conscious of it or not. It is they which make kings or pawns of the insignificant figures who move about on the

checker-board of life, turning some poor devil of a casual father into a ferocious tyrant, or a silly goose of an unwilling mother into a goddess of fate. For behind every individual father there stands the primordial image of the Father, and behind the fleeting personal mother the magical figure of the Magna Mater. These archetypes of the collective psyche, whose power is magnified in immortal works of art and in the fiery tenets of religion, are the dominants that rule the preconscious soul of the child and, when projected upon the human parents, lend them a fascination which often assumes monstrous proportions. From that there arises the false aetiology of neurosis which, in Freud, ossified into a system: the Oedipus complex. And that is also why, in the later life of the neurotic, the images of the parents can be criticized, corrected, and reduced to human dimensions, while yet continuing to work like divine agencies. Did the human father really possess this mysterious power, his sons would soon liquidate him or, even better, would refrain from becoming fathers themselves. For what ethical person could possibly bear so gigantic a responsibility? Far better to leave this sovereign power to the gods, with whom it had always rested before man became “enlightened.”

CHILD DEVELOPMENT AND EDUCATION

CHILD DEVELOPMENT AND EDUCATION¹

[98] It is with a certain hesitation that I undertake the task of presenting to you, in a brief lecture, the connection between the findings of analytical psychology and the general problems of education. In the first place, it is a large and extensive field of human experience which cannot possibly be covered in a few pithy sentences. Furthermore, analytical psychology deals with a method and a system of thought neither of which can be assumed to be generally known. Hence their applicability to educational problems is not easily demonstrated. An historical introduction to the way in which this youngest of the psychological sciences has developed is almost indispensable, for it enables us to understand many things which, if we met them today for the first time, would be most difficult to grasp.

[99] Developing out of therapeutic experiences with hypnotism, psychoanalysis, as Freud termed it, became a specific medical technique for investigating the causes of functional, or non-organic, nervous disorders. It was primarily concerned with the sexual origins of these disorders, and its value as a method of therapy was based on the assumption that a permanent curative effect would result from bringing the sexual causes to consciousness. The entire Freudian school still takes this view of psychoanalysis and refuses to recognize any causation of nervous disorders other than the sexual. Although originally subscribing to this method, I have, during the course of years, developed the conception of *analytical psychology*, which lays stress on the fact that psychological investigation along psychoanalytic lines has left the narrow confines of a medical technique, with its restriction to certain theoretical assumptions, and has passed over into the general field of normal psychology. Therefore, when I speak of the connection between analytical psychology and education, I am leaving Freudian analysis out of account. Since the latter is a psychology which deals exclusively with the ramifications of the sexual instinct in the psyche, it would be pertinent to the discussion only if we were dealing exclusively with the sexual psychology of the child. But at the outset I must make it perfectly clear that I in no way support those views which maintain that the relation of the child to the parents, or to his brothers, sisters, comrades, is to be explained simply as the immature beginnings of the sexual function. Those views, surely not unknown to you, are in my opinion premature and one-sided generalizations which have already given rise to the most absurd misinterpretations. When pathological phenomena are present to a degree which would justify a psychological explanation along sexual lines, it is not the child's own psychology that is fundamentally

responsible, but the sexually disturbed psychology of the parents. The mind of the child is extremely susceptible and dependent, and is steeped for a long time in the atmosphere of his parental psychology, only freeing itself from this influence relatively late, if at all.²

100] I will now try to give you some idea of the fundamental viewpoints of analytical psychology which are useful in considering the mind of the child, especially at school age. You must not think that I am in a position to offer you a list of hints for immediate application. All I can do is to provide a deeper insight into the general laws which underlie the psychic development of the child. But I shall be content if, from what I am able to give you, you carry away a sense of the mysterious evolution of the highest human faculties. The great responsibility which devolves upon you as educators of the next generation will prevent you from forming hasty conclusions; for there are certain viewpoints which need to germinate, often for a long time, before they can profitably be put into practice. The deepened psychological knowledge of the teacher should not, as unfortunately sometimes happens, be unloaded directly on the child; rather it should help the teacher to adopt an understanding attitude towards the child's psychic life. This knowledge is definitely for adults, not for children. What *they* are given must always be something elementary, and suited to the immature mind.

101] One of the most important achievements of analytical psychology is undoubtedly the recognition of the biological structure of the mind, but it is not easy to put into a few words something that has taken many years to discover. Therefore if at first I seem to range rather far afield, I do so only in order to bring certain general reflections to bear upon the particular problem of the child-mind.

102] Experimental psychology, represented at its best by the school of Wundt, has, as you know, occupied itself exclusively with the psychology of normal consciousness, as though the mind consisted solely of conscious phenomena. But medical psychology, especially the French school, was soon forced to recognize the existence of unconscious psychic phenomena. We know today that the conscious mind consists only of those ideational complexes which are directly associated with the ego. Those psychic factors which possess only a slight degree of intensity, or those which once had intensity but have lost it again, are "under the threshold," that is, they are subliminal, and belong to the sphere of the unconscious. By virtue of its indefinite extension the unconscious might be compared to the sea, while consciousness is like an island rising out of its midst. This comparison, however, must not be pushed too far; for the relation of conscious to unconscious is essentially different from that of an island to the sea. It is not in any sense a stable relationship, but a ceaseless welling-up, a constant shifting of content; for, like the conscious, the unconscious is never at rest, never stagnant. It lives and works in a

state of perpetual interaction with the conscious. Conscious contents that have lost their intensity, or their actuality, sink into the unconscious, and this we call forgetting. Conversely, out of the unconscious, there rise up new ideas and tendencies which, as they emerge into consciousness, are known to us as fantasies and impulses. The unconscious is the matrix out of which consciousness grows; for consciousness does not enter the world as a finished product, but is the end-result of small beginnings.

103] This development takes place in the child. During the first years of life there is hardly any consciousness, though the existence of psychic processes manifests itself at a very early stage. These processes, however, are not grouped round an organized ego; they have no centre and therefore no continuity, lacking which a conscious personality is impossible. Consequently the child has in our sense no memory, despite the plasticity and susceptibility of its psychic organ. Only when the child begins to say "I" is there any perceptible continuity of consciousness. But in between there are frequent periods of unconsciousness. One can actually see the conscious mind coming into existence through the gradual unification of fragments. This process continues throughout life, but from puberty onwards it becomes slower, and fewer and fewer fragments of the unconscious are added to consciousness. The greatest and most extensive development takes place during the period between birth and the end of psychic puberty, a period that may normally extend, for a man of our climate and race, to the twenty-fifth year. In the case of a woman it usually ends when she is about nineteen or twenty. This development establishes a firm connection between the ego and the previously unconscious psychic processes, thus separating them from their source in the unconscious. In this way the conscious rises out of the unconscious like an island newly risen from the sea. We reinforce this process in children by education and culture. School is in fact a means of strengthening in a purposeful way the integration of consciousness.

104] Now if we were to ask what would happen if there were no schools, and children were left entirely to themselves, we should have to answer that they would remain largely unconscious. What kind of a state would this be? It would be a primitive state, and when such children came of age they would, despite their native intelligence, still remain primitive—savages, in fact, rather like a tribe of intelligent Negroes or Bushmen. They would not necessarily be stupid, but merely intelligent by instinct. They would be ignorant, and therefore unconscious of themselves and the world. Beginning life on a very much lower cultural level, they would differentiate themselves only slightly from the primitive races. This possibility of regression to the primitive stage is explained by the fundamental biogenetic law which holds good not only for the development of the body, but also in all probability for that of the psyche.

105] According to this law the evolution of the species repeats itself in the embryonic development of the individual. Thus, to a certain degree, man in his embryonic life passes through the anatomical forms of primeval times. If the same law holds for the mental development of mankind, it follows that the child develops out of an originally unconscious, animal condition into consciousness, primitive at first, and then slowly becoming more civilized.

106] The condition during the first two or three years of his life, when the child is unconscious of himself, may be compared to the animal state. Just as the child in embryo is practically nothing but a part of the mother's body, and wholly dependent on her, so in early infancy the psyche is to a large extent part of the maternal psyche, and will soon become part of the paternal psyche as well. The prime psychological condition is one of fusion with the psychology of the parents, an individual psychology being only potentially present. Hence it is that the nervous and psychic disorders of children right up to school age depend very largely on disturbances in the psychic world of the parents. All parental difficulties reflect themselves without fail in the psyche of the child, sometimes with pathological results. The dreams of small children often refer more to the parents than to the child itself. Long ago I observed some very curious dreams in early childhood, for instance the first dreams patients could remember. They were "big dreams," and their content was often so very unchildlike that at first I was convinced they could be explained by the psychology of the parents. There was the case of a boy who dreamt out the whole erotic and religious problem of his father. The father could remember no dreams at all, so for some time I analysed the father through the dreams of his eight-year-old son. Eventually the father began to dream himself, and the dreams of the child stopped. Later on I realized that the peculiar dreams of small children are genuine enough, since they contain archetypes which are the cause of their apparently adult character.³

107] A marked change occurs when the child develops consciousness of his ego, a fact which is registered by his referring to himself as "I." This change normally takes place between the third and fifth year, but it may begin earlier. From this moment we can speak of the existence of an individual psyche, though normally the psyche attains relative independence only after puberty. Up till then it has been largely the plaything of instinct and environment. The child who enters school at six is still for the most part the psychic product of his parents, endowed, it is true, with the nucleus of ego-consciousness, but incapable of asserting his unconscious individuality. One is often tempted to interpret children who are peculiar, obstinate, disobedient, or difficult to handle as especially individual or self-willed. This is a mistake. In such cases we should always examine the parental milieu, its psychological conditions and history.⁴ Almost without exception we discover in the parents the only valid

reasons for the child's difficulties. His disquieting peculiarities are far less the expression of his own inner life than a reflection of disturbing influences in the home. If the physician has to deal with nervous disorders in a child of this age, he will have to pay serious attention to the psychic state of the parents; to their problems, the way they live and do not live, the aspirations they have fulfilled or neglected, and to the predominant family atmosphere and the method of education. All these psychic conditions influence a child profoundly. In his early years the child lives in a state of *participation mystique* with his parents. Time and again it can be seen how he reacts immediately to any important developments in the parental psyche. Needless to say both the parents and the child are unconscious of what is going on. The infectious nature of the parents' complexes can be seen from the effect their mannerisms have on their children. Even when they make completely successful efforts to control themselves, so that no adult could detect the least trace of a complex, the children will get wind of it somehow. I remember a very revealing case of three girls who had a *most* devoted mother. When they were approaching puberty they confessed shamefacedly to each other that for years they had suffered from horrible dreams about her. They dreamt of her as a witch or a dangerous animal, and they could not understand it at all, since their mother was so lovely and so utterly devoted to them. Years later the mother became insane, and in her insanity would exhibit a sort of lycanthropy in which she crawled about on all fours and imitated the grunting of pigs, the barking of dogs, and the growling of bears.

107^{a]} This is an expression of primitive identity, from which the individual consciousness frees itself only gradually. In this battle for freedom the school plays a not unimportant part, as it is the first milieu the child finds outside his home. School comrades take the place of brothers and sisters; the teacher, if a man, acts as a substitute for the father, and, if a woman, for the mother. It is important that the teacher should be conscious of the role he is playing. He must not be satisfied with merely pounding the curriculum into the child; he must also influence him through his personality. This latter function is at least as important as the actual teaching, if not more so in certain cases. Though it is a misfortune for a child to have no parents, it is equally dangerous for him to be too closely bound to his family. An excessively strong attachment to the parents is a severe handicap in his later adaptation to the world, for a growing human being is not destined to remain forever the child of his parents. There are, unfortunately, many parents who keep their children infantile because they themselves do not wish to grow old and give up their parental authority and power. In this way they exercise an extremely bad influence over their children, since they deprive them of every opportunity for individual responsibility. These disastrous methods of upbringing result either in dependent personalities, or in men and women who can achieve their independence only by furtive means.

There are other parents, again, who on account of their own weaknesses are not in a position to meet the child with the authority it needs if it is to take its proper place in the world. The teacher, as a personality, is then faced with the delicate task of avoiding repressive authority, while at the same time exercising that just degree of authority which is appropriate to the adult in his dealings with children. This attitude cannot be produced artificially; it can only come about in a natural way when the teacher does his duty as a man and a citizen. He must be an upright and healthy man himself, for good example still remains the best pedagogic method. But it is also true that the very best method avails nothing if its practitioner does not hold his position on his personal merits. It would be different if the only thing that mattered in school life were the methodical teaching of the curriculum. But that is at most only half the meaning of school. The other half is the real psychological education made possible through the personality of the teacher. This education means guiding the child into the larger world and widening the scope of parental training. For however careful the latter is, it can never avoid a certain one-sidedness, as the milieu always remains the same. School, on the other hand, is the first impact of the greater world which the child has to meet, and it ought to help him to free himself progressively from the parental environment. The child naturally brings to the teacher the kind of adaptation he has learned from his father; he projects the father-image upon him, with the added tendency to assimilate the personality of the teacher to the father-image. It is therefore necessary for the teacher to adopt the personal approach, or at any rate to leave the door open for such a contact. If the personal relationship of child to teacher is a good one, it matters very little whether the method of teaching is the most up to date. Success does not depend on the method, any more than it is the exclusive aim of school life to stuff the children's heads with knowledge, but rather to make them real men and women. We need not concern ourselves so much with the amount of specific information a child takes away with him from school; the thing of vital importance is that the school should succeed in freeing the young man from unconscious identity with his family, and should make him properly conscious of himself. Without this consciousness he will never know what he really wants, but will always remain dependent and imitative, with the feeling of being misunderstood and suppressed.

108] In what I have just said I have tried to give you a general picture of the child psyche from the standpoint of analytical psychology; but so far I have remained only on the surface. We can go very much deeper if we apply the methods of investigation used in analytical psychology. The practical application of these would be out of the question for the ordinary teacher, and an amateurish or half-serious use of them is to be severely discouraged, although some knowledge of them on the part of the teacher is certainly desirable. It is by no means desirable, however, that he

should apply them directly to the education of the children. It is his own education that needs them, and this will eventually redound to the good of his pupils.

109] You may perhaps be surprised to hear me speak of the education of the educator, but I must tell you that I am far from thinking that a man's education is completed when he leaves school, even if he has achieved the university grade. There should be not only continuation courses for young people, but continuation schools for adults. At present we educate people only up to the point where they can earn a living and marry; then education ceases altogether, as though a complete mental outfit had been acquired. The solution of all the remaining complicated problems of life is left to the discretion—and ignorance—of the individual. Innumerable ill-advised and unhappy marriages, innumerable professional disappointments, are due solely to this lack of adult education. Vast numbers of men and women thus spend their entire lives in complete ignorance of the most important things. Many childish vices are believed to be ineradicable, largely because they are often found in adults whose education is supposed to be finished, and who are therefore thought to be long past the educable period. There was never a greater mistake. The adult *is* educable, and can respond gratefully to the art of individual education; but naturally his education cannot be conducted along the lines suitable to the child. He has lost the extraordinary plasticity of the child's mind, and has acquired a will of his own, personal convictions, and a more or less definite consciousness of himself, so that he is far less amenable to systematic influence. To this must be added the fact that the child, in his psychic development, passes through the ancestral stages and is only educated up to the modern level of culture and consciousness. The adult, however, stands firmly on this level and feels himself to be the upholder of contemporary culture. He therefore has little inclination to submit to a teacher like a child. As a matter of fact, it is important that he should not submit, otherwise he might easily slip back into a childish state of dependence.

110] The educational method, then, that will best meet the needs of the adult must be indirect rather than direct; that is to say, it must put him in possession of such psychological knowledge as will permit him to educate himself. Such an effort could not and should not be expected from a child, but we can expect it from an adult, especially if he is a teacher. The teacher must not be a merely passive upholder of culture; he must actively promote that culture through his own self-education. His culture must never remain at a standstill, otherwise he will start correcting in the children those faults which he has neglected in himself. This is manifestly the antithesis of education.

111] Analytical psychology has given considerable thought to the methods for aiding the adult in his psychic growth, but if I speak to you about them now, it is for the sole purpose of making clear the possibilities of continued self-education. I must

warn you again most emphatically that it would be very unsound to apply these methods directly to children. The indispensable basis of self-education is self-knowledge. We gain self-knowledge partly from a critical survey and judgment of our own actions, and partly from the criticism of others. Self-criticism, however, is all too prone to personal prejudice, while criticism from others is liable to err or to be otherwise displeasing to us. At all events, the self-knowledge accruing to us from these two sources is incomplete and confused like all human judgments, which are seldom free from the falsifications of desire and fear. But is there not some objective critique which will tell us what we really are, somewhat after the fashion, say, of a thermometer, which confronts the fever patient with the indisputable fact that he has a temperature of exactly 103.1°? Where our bodies are concerned we do not deny the existence of objective criteria. If, for example, we are convinced that we can eat strawberries, like everybody else, without ill effects, and the body nevertheless reacts with a violent rash, this is objective proof that despite our idea to the contrary we are allergic to strawberries.

112] But when it comes to psychology, it seems to us that everything is voluntary and subject to our choice. This universal prejudice arises from our tendency to identify the whole psyche with the conscious phase of it. There are, however, many extremely important psychic processes which are unconscious, or only indirectly conscious. Of the unconscious we can know nothing directly, but indirectly we can perceive the effects that come into consciousness. If everything in consciousness were, as it seems, subject to our will and choice, then we could not discover anywhere an objective criterion by which to test our self-knowledge. Yet there is something independent of desire and fear, something as impersonal as a product of nature, that enables us to know the truth about ourselves. This objective statement is to be found in a product of psychic activity which is the very last thing we would credit with such a meaning, namely the dream.

113] What are dreams? Dreams are products of unconscious psychic activity occurring during sleep. In this condition the mind is to a large extent withdrawn from our voluntary control. With the small portion of consciousness that remains to us in the dream state we apperceive what is going on, but we are no longer in a position to guide the course of psychic events according to our wish and purpose; hence we are also robbed of the possibility of deceiving ourselves. The dream is a spontaneous process resulting from the independent activity of the unconscious, and is as far removed from our conscious control as, shall we say, the physiological activity of digestion. Therefore, we have in it an absolutely objective process from the nature of which we can draw objective conclusions about the situation as it really is.

114] That is all very well, you will say, but how in the world is it possible to draw trustworthy conclusions from the fortuitous and chaotic confusion of a dream? To

this I hasten to reply that dreams are only apparently fortuitous and chaotic. On closer inspection we discover a remarkable sequence in the dream-images, both in relation to one another and in relation to the content of waking consciousness. This discovery was made by means of a relatively simple procedure, which works as follows: The body of the dream is divided into its separate portions or images, and all the free associations to each portion are collected. In doing this, we soon become aware of an extremely intimate connection between the dream-images and the things that occupy our thoughts in the waking state, although the meaning of this connection may not be immediately apparent. By collecting all the associations we complete the preliminary part of the dream analysis, thus establishing the context, which shows the manifold connections of the dream with the contents of consciousness and the intimate way in which it is bound up with the tendencies of the personality.

115] When we have illuminated the dream from all sides we can begin the second part of our task, namely the interpretation of the material before us. Here as everywhere in science, we must rid ourselves of prejudice as far as possible, and let the material speak for itself. In very many cases a single glance at the dream and the assembled material suffices to give us at least an intuition of its meaning, and no special effort of thought is needed to interpret it. In other cases it requires much labour and considerable experience. Unfortunately I cannot enter here into the far-reaching question of dream-symbolism. Massive tomes have been written on this subject, and although in practice we cannot do without the experience stored up in these volumes, there are many cases where sound common sense is enough.

116] By way of illustration I shall now give you a short dream, together with its meaning.

117] The dreamer was a man with an academic education, about fifty years of age. I knew him only slightly, and our occasional meetings consisted mostly of humorous gibes on his part at what we called the "game" of dream interpretation. On one of these occasions he asked me laughingly if I was still at it. I replied that he obviously had a very mistaken idea of the nature of dreams. He then remarked that he had just had a dream which I must interpret for him. I said I would do so, and he told me the following dream:

He was alone in the mountains, and wanted to climb a very high, steep mountain which he could see towering in front of him. At first the ascent was laborious, but then it seemed to him that the higher he climbed the more he felt himself being drawn towards the summit. Faster and faster he climbed, and gradually a sort of ecstasy came over him. He felt he was actually soaring up on wings, and when he reached the top he seemed to weigh nothing at all, and stepped lightly off into empty space. Here he awoke.

118] He wanted to know what I thought of his dream. I knew that he was not only an experienced but an ardent mountain-climber, so I was not surprised to see yet another vindication of the rule that dreams speak the same language as the dreamer. Knowing that mountaineering was such a passion with him, I got him to talk about it. He seized on this eagerly and told me how he loved to go alone without a guide, because the very danger of it had a tremendous fascination for him. He also told me about several dangerous tours, and the daring he displayed made a particular impression on me. I asked myself what it could be that impelled him to seek out such dangerous situations, apparently with an almost morbid enjoyment. Evidently a similar thought occurred to him, for he added, becoming at the same time more serious, that he had no fear of danger, since he thought that death in the mountains would be something very beautiful. This remark threw a significant light on the dream. Obviously he was looking for danger, possibly with the unavowed idea of suicide. But why should he deliberately seek death? There must be some special reason. I therefore threw in the remark that a man in his position ought not to expose himself to such risks. To which he replied very emphatically that he would never “give up his mountains,” that he had to go to them in order to get away from the city and his family. “This sticking at home does not suit me,” he said. Here was a clue to the deeper reason for his passion. I gathered that his marriage was a failure, and that there was nothing to keep him at home. Also he seemed disgusted with his professional work. It occurred to me that his uncanny passion for the mountains must be an avenue of escape from an existence that had become intolerable to him.

119] I therefore privately interpreted the dream as follows: Since he still clung on to life in spite of himself, the ascent of the mountain was at first laborious. But the more he surrendered himself to his passion, the more it lured him on and lent wings to his feet. Finally it lured him completely out of himself: he lost all sense of bodily weight and climbed even higher than the mountain, out into empty space. Obviously this meant death in the mountains.

120] After a pause, he said suddenly, “Well, we’ve talked about all sorts of other things. You were going to interpret my dream. What do you think about it?” I told him quite frankly what I thought, namely that he was seeking his death in the mountains, and that with such an attitude he stood a remarkably good chance of finding it.

121] “But that is absurd,” he replied, laughing. “On the contrary, I am seeking my health in the mountains.”

122] Vainly I tried to make him see the gravity of the situation. Six months later, on the descent from a very dangerous peak, he literally stepped off into space. He fell on the head of a companion who was standing on a ledge below him, and both were killed.⁵

- 123] From this dream we can observe the general function of dreams. It reflects certain vital tendencies of the personality, either those whose meaning embraces our whole life, or those which are momentarily of most importance. The dream presents an objective statement of these tendencies, a statement unconcerned with our conscious wishes and beliefs. After this you will probably agree with me that a dream may in certain circumstances be of inestimable value for conscious life, even when it is not, as here, a matter of life and death.
- 124] How much of moral and practical value this dreamer would have gained if only he had known of his dangerous lack of restraint!
- 125] That is why, as physicians of the soul, we have to turn to the ancient art of dream interpretation. We have to educate adults who are no longer willing, like children, to be guided by authority. We have to do with men and women whose way of life is so individual that no counsellor, however wise, could prescribe the way that is uniquely right for them. Therefore we have to teach them to listen to their own natures, so that they can understand from within themselves what is happening.
- 126] So far as is possible within the limits of a lecture, I have tried to give you some insight into the world of analytical psychology and its ideas. I for my part shall be satisfied if what I have said is of help to you in your profession.

IV

ANALYTICAL PSYCHOLOGY AND EDUCATION

[The following three lectures were delivered at the International Congress of Education, in London in 1924. They were originally drafted in English by the author and revised by Roberts Aldrich. They were then published in German as *Analytische Psychologie und Erziehung* (Heidelberg, 1926), and the English version was subsequently published in *Contributions to Analytical Psychology* (London and New York, 1928) together with the preceding lecture. The present new translation is made from the revised and enlarged edition of *Psychologie und Erziehung* (Zurich, 1946), on the basis of careful comparison between it and the earlier English version.—EDITORS.]

LECTURE ONE

127] Psychology is one of the youngest sciences. The word “psychology” has been in use for a long time, but formerly it was only the title of a certain chapter in philosophy—that chapter in which the philosopher more or less laid down the law as to what the human soul had to be according to the premises of his own particular philosophy. I remember, as a young student, that I used to enjoy the privilege of hearing from one professor how little was known about the real nature of psychic processes, and from another exactly what the psyche had to be as a logical necessity. If one studies the origins of modern empirical psychology one is profoundly impressed by the fight which the earliest investigators had to wage against the firmly entrenched scholastic way of thinking. Philosophic thought, powerfully influenced by theology (“queen of sciences”), had a decidedly deductive tendency, and over it there reigned a mass of naïve, idealistic preconceptions which were bound sooner or later to lead to a reaction. This reaction took the form of the materialism of the nineteenth century, from whose outlook we are not yet completely freed even today. The success of the empirical method is so undeniable that the splendour of its victory has even begotten a materialistic philosophy, which in reality is more a psychological reaction than a justifiable scientific theory. The materialistic outlook is an exaggerated reaction against the medieval idealism and has nothing to do with the empirical method as such.

128] Thus modern empirical psychology was cradled in an atmosphere of rank materialism. It was first and foremost a physiological psychology, thoroughly empirical in its experimental basis, viewing the psychic process exclusively from outside and mainly with an eye to its physiological manifestations. Such a state of affairs was fairly satisfactory so long as psychology was a department of philosophy or of the natural sciences. So long as it was restricted to the laboratory, psychology could remain purely experimental and could regard the psychic process entirely from outside. Instead of the old dogmatic psychology we now had a philosophical psychology no less academic in its origins. However, the peace of the academic laboratory was soon to be disturbed by the demands of those who needed psychology for practical purposes. These intruders were the doctors. The neurologist as well as the psychiatrist has to concern himself with psychic disorders and therefore feels the urgent need of a psychology that can be practically applied. Quite independently of the developments of academic psychology medical men had already discovered a means of access to the human mind and to the psychological treatment of its disorders. This was hypnotism, which grew out of what had been

called “mesmerism” in the latter part of the eighteenth century, and “animal magnetism” at the beginning of the nineteenth. The development of hypnotism led, via Charcot, Liébeault, and Bernheim, to the kind of medical psychology represented by Pierre Janet. Another of Charcot’s pupils, Freud, in Vienna,¹ used the hypnotic method at first very much in the same way as Janet, but he soon struck out on a different path. Whereas Janet remained for the most part descriptive, Freud penetrated further and more deeply into matters which, to the medical science of those days, hardly seemed worth investigating, namely the morbid fantasies of the patient and their activity in the realm of the unconscious mind. It would be unjust to imply that Janet overlooked this; indeed the contrary is the case. It is his great merit to have pointed out the existence and the importance of unconscious processes in the psychological structure of nervous and mental disorders. Freud’s particular merit lies not in the actual discovery of unconscious activity, but in unveiling the real nature of this activity, and above all in working out a practical method for exploring the unconscious. Independently of Freud, I too had approached the problem of a practical psychology firstly from the side of experimental psychopathology, employing chiefly the association method, and then from the study of the personality.² As Freud made the hitherto neglected morbid fantasies of the patient his special field of research,³ so I directed my attention more particularly to the reasons why people made certain mistakes in the course of the association experiment. Like the fantasies of hysterics, the disturbances in the association experiment were regarded as valueless and meaningless, a purely fortuitous phenomenon, in a word, as so much *materia vilis*. I discovered,⁴ however, that these disturbances were due to the operation of unconscious processes which I called “feeling-toned complexes.”⁵ After having, so to speak, put my finger on the same psychological mechanisms as Freud, it was natural that I should become his pupil and collaborator over a period of many years. But while I always recognized the truth of his conclusions so far as the facts were concerned, I could not conceal my doubts as to the validity of his theories. His regrettable dogmatism was the main reason why I felt obliged to part company from him. My scientific conscience would not allow me to lend support to an almost fanatical dogma based on a one-sided interpretation of the facts.

129] Freud’s achievement is by no means inconsiderable. But while he shares with others the discovery of the unconscious in relation to the aetiology and structure of neuroses and psychoses, his great and unique merit, to my mind, lies in his discovery of a method for exploring the unconscious and, more particularly, dreams. He was the first to make the bold attempt to throw open the secret doors of the dream. The discovery that dreams have a meaning, and that there is a way to an understanding of them, is perhaps the most significant and most valuable part of this

remarkable edifice called psychoanalysis. I do not wish to belittle Freud's achievement, but I feel I must be fair to all those who have wrestled with the great problems of medical psychology and who, through their labours, have laid the foundations without which neither Freud nor myself would have been able to accomplish our tasks. Thus Pierre Janet, Auguste Forel, Théodore Flournoy, Morton Prince, Eugen Bleuler, deserve gratitude and remembrance whenever we speak of the first steps of medical psychology.

130] Freud's work has shown that the functional neuroses are causally based on unconscious contents whose nature, when understood, allows us to see how the disease came about. The value of this discovery is as great as the discovery of the specific cause of tuberculosis and other infectious diseases. Moreover, quite apart from the therapeutic importance of analytical psychology, the psychology of the normal has been tremendously enriched, for the understanding of dreams has opened up an almost limitless vista, showing how consciousness develops out of the remotest and darkest depths of the unconscious, while the practical application of the analytical method has enabled us to distinguish typical functions and attitudes in the behaviour of normal individuals. In so far as psychoanalysis is a branch of medical psychology, it concerns itself solely with abnormal cases and should therefore be reserved for the physician; but dream psychology, studied for the light it throws upon normal human behaviour, will be of ever-increasing interest to thoughtful people generally, and especially to those with educational inclinations. It is in fact highly desirable that the educator, if he wishes really to understand the mentality of his pupils, should pay attention to the findings of analytical psychology. That, however, presupposes some knowledge of psychopathology, for the abnormal child is far harder to understand than the normal. Abnormality and disease are not far apart, and just as one expects some knowledge of the physical ailments of children from the all-round educated teacher, so one might expect from him a little knowledge of their psychic ailments.

131] There are five main groups of psychic disturbances in children:

BACKWARD CHILDREN. A common form of backward child is the mental defective, characterized chiefly by low intelligence and a general incapacity to understand.

132] The most obvious type is the phlegmatic, slow, dull-witted, stupid child. Among these cases may be found children who, for all their poverty of intellect, are distinguished by a certain richness of heart, and who are capable of loyalty, affection, devotion, reliability, and self-sacrifice. The less obvious and rarer type is the excitable, easily irritated child, whose mental incapacity is no less indubitable than that of the defective, but is often markedly one-sided.

133] From these congenital and practically incurable, though not ineducable, types we must distinguish the child with arrested mental development. His development is

very slow, at times almost imperceptible, and it often needs the expert diagnosis of a skilled psychiatrist to decide whether it is a case of mental defect or not. Such children frequently have the emotional reactions of imbeciles. I was once consulted about a boy of six years old who suffered from violent fits of rage, during which he used to smash his toys and threaten his parents and his nurse in quite a dangerous way. In addition he “refused to speak,” as his parents put it. He was a little fellow, well-fed, but terribly suspicious, malevolent, obstinate, and altogether negative. It was perfectly obvious that he was an imbecile and simply *could* not speak. He had never learnt how to do so. But his imbecility was not bad enough to account entirely for his inability to speak. His general behaviour pointed to a neurosis. Whenever a young child exhibits the symptoms of a neurosis one should not waste too much time examining his unconscious. One should begin one’s investigations elsewhere, starting with the mother; for almost invariably the parents are either the direct cause of the child’s neurosis or at least the most important element in it. Thus I found that the child was the only boy among seven girls. The mother was an ambitious, self-willed woman, who took it as an insult when I told her that her son was not normal. She had deliberately repressed all knowledge of the boy’s infirmity; he simply *had* to be intelligent, and if he was stupid, it was all due to his evil will and malicious obstinacy. Naturally the boy learnt far less than he would have done had he been lucky enough to possess a reasonable mother; in fact he learnt nothing at all. What is more, he duly became the very things his mother’s own ambition drove him to, namely, malicious and self-willed. Totally misunderstood, and therefore isolated within himself, he developed his fits of rage out of sheer despair. I know of another boy, of fourteen, in much the same family circumstances. He killed his stepfather with an axe during a paroxysm of rage. He too had been pushed too far.

134] Arrested mental development is found not infrequently in first children, or in children whose parents are estranged through psychic incompatibilities. It may also result from the mother’s illness during pregnancy, or from prolonged labour, or from deformation of the skull and hemorrhage during delivery. If such children are not ruined by educational forcing, they normally attain a relative mental maturity in the course of time, though it may be later than with ordinary children.

135] The second group comprises PSYCHOPATHIC CHILDREN. In cases of moral insanity the disorder is either congenital or due to organic injury of parts of the brain by wounding or disease. Such cases are incurable. Occasionally they become criminals and they have in them the seeds of habitual criminality.

136] From this group one must carefully distinguish the child with arrested moral development, the morbidly autoerotic type. These cases often display an alarming amount of egotism and premature sexual activity; in addition they are untruthful and unreliable, and almost completely lacking in human feeling and love. As a rule they

are illegitimate or adopted children who have unfortunately never been warmed and nourished by the psychic atmosphere of a real father and mother. They suffer from an almost organic lack of something that every child needs as a vital necessity, namely the psychically nourishing care of parents, and especially of a mother. As a result, illegitimate children in particular are always exposed to psychic danger, and it is the moral sphere that suffers first and foremost. Many children can adapt to foster parents, but not all; and those who cannot, develop an extremely self-centred and ruthlessly egotistical attitude for the unconscious purpose of getting for themselves what the real parents have failed to give them. Such cases are not always incurable. I once saw a boy who violated his four-year-old sister when he was five, tried to kill his father when he was nine, but at the age of eighteen was developing into satisfactory normality, despite a diagnosis of incurable moral insanity. If the unbridled licentiousness to which such cases are sometimes prone is coupled with a good intelligence, and if there is no irreparable break with society, these patients can give up their criminal tendencies by using their heads. Nevertheless, it is to be observed that reason is a very flimsy barrier against pathological proclivities.

137] The third group consists of EPILEPTIC CHILDREN. These cases are unfortunately not uncommon. It is easy enough to recognize a true epileptic attack, but what is called "petit mal" is an exceedingly obscure and complicated condition. Here there are no obvious attacks, only very peculiar and often hardly perceptible alterations of consciousness, which nevertheless pass over into the severe mental disorder of the epileptic with his irritability ferocity, greediness, his sticky sentimentality, his morbid passion for justice, his egotism, and his narrow range of interests. It is of course impossible to enumerate here all the manifold forms of epilepsy; but, in order to illustrate its symptomatology, I will mention the case of a small boy who began to behave strangely when he was about seven years old. The first thing to be noticed was that he used to disappear abruptly, and was then found hiding in the cellar or in a dark corner of the attic. It was impossible to get him to explain why he ran away so suddenly and hid himself. Sometimes he would leave off playing and bury his face in his mother's skirts. At first these things happened so rarely that no attention was paid to his odd behaviour, but when he began to do the same thing at school, suddenly leaving his desk and running to the teacher, his family became alarmed. Nobody, however, had thought of the possibility of a serious disease. Occasionally, too, he would stop short for a few seconds in the middle of a game, or even in the middle of a sentence, without any explanation and apparently without even knowing that the lapse had occurred. Gradually he developed a rather disagreeable and irritable character. Sometimes he had fits of rage, and on one occasion he threw a pair of scissors at his little sister with such force that the point pierced the bone of the skull just above the eyes, nearly killing her. As the parents did not think of

consulting a psychiatrist, the disease remained unrecognized, and he was treated simply as a bad boy. At the age of twelve he had his first observed epileptic fit, and only then was his disease understood. Despite great difficulties I was able to find out from the boy that when he was about six he began to be seized with terror of some unknown being. When he was alone, he had the feeling that someone unseen was present. Later he came to see a short man with a beard, a man he had never seen before, but whose features he could describe in great detail. This man suddenly appeared before him and frightened him so much that he ran away and hid himself. It was difficult to discover why the man was so terrifying. The boy was obviously upset about something, which he treated as a dreadful secret. It took me hours to win his confidence, but eventually he confessed. "This man tried to make me take something terrible from him. I can't tell you what it was, it was frightful. He came nearer and nearer and kept on insisting that I must take it, but I was so frightened that I always ran away and did not take it." As he said this he turned pale and began to tremble with fear. When at last I succeeded in calming him down, he said, "This man tried to make me take a *sin*." "But what sort of a sin?" I asked. The boy stood up, looked suspiciously all round him, and then whispered, "It was murder." When he was eight years old he had, as I mentioned above, made a violent attack on his sister. Later, the attacks of fear continued, but the vision changed. The terrible man did not return; but in his stead there appeared the figure of a nun, a sort of nurse. At first her face was veiled, but later it was unveiled, revealing a most terrifying expression, a pale, deathlike face. Between the ages of nine and twelve he was haunted by this figure. The fits of rage, despite his growing irritability, ceased, but the manifest epileptic attacks began to appear instead. Clearly, the vision of the nun signified the changing of the incompatible criminal tendency symbolized by the bearded man into obvious disease.⁶

138] Sometimes such cases are still mainly functional and not yet organic, so that it is possible to do something for them with psychotherapy. That is why I have mentioned this case in some detail. It may give some idea of what goes on in the child's mind behind the scenes.

139] The fourth group comprises the various forms of PSYCHOSIS. Although such cases are not common among children, one can find at least the first stages of that pathological mental development which later, after puberty, leads to schizophrenia in all its manifold forms. As a rule these children behave in a strange and even bizarre way; they are incomprehensible, often quite un-get-at-able, hypersensitive, shut in, emotionally abnormal, being either torpid or liable to explode over the most trifling causes.

140] I once had to examine a boy of fourteen in whom sexual activity had begun suddenly and somewhat prematurely in a rather disquieting way, so that it disturbed

his sleep and upset his general health. The trouble began when the boy went to a dance and a certain girl refused to dance with him. He went away in high dudgeon. When he got home he tried to learn his school lessons, but found it was impossible because of a mounting and indescribable emotion compounded of fear, rage, and despair, which took hold of him more and more until at last he rushed out into the garden and rolled on the ground in an almost unconscious condition. After a couple of hours the emotion passed and the sexual trouble began. There were several cases of schizophrenia in this boy's family. This is a typical pathological emotion characteristic of children with a bad family inheritance.

141] The fifth group consists of NEUROTIC CHILDREN. It is of course quite beyond the scope of a single lecture to describe all the symptoms and forms of a childhood neurosis. Anything may be found, ranging from abnormally naughty behaviour to definitely hysterical attacks and states. The trouble can be apparently physical, for instance hysterical fever or abnormally low temperature, convulsions, paralysis, pain, digestive disturbances, etc., or it can be mental and moral, taking the form of excitement or depression, lying, sexual perversion, stealing, and so forth. I remember the case of a little girl of four who had suffered from the most chronic constipation since the first year of her life. She had already undergone every imaginable and unimaginable kind of physical treatment. All were useless, because the doctors overlooked the one important factor in the child's life, namely her mother. As soon as I saw the mother I realized that she was the real cause, and so I suggested treating her and advised her at the same time to give up the child. Another person took the mother's place, and the next day the trouble was gone, and did not return, as I was able to follow up the case for many years afterward. The solution of this problem was quite simple as regards the child, though of course it would not have been so had not the pathogenic influence coming from the mother been removed through analysis. The little girl was a youngest child, the regular pet of a neurotic mother. The latter projected all her phobias onto the child and surrounded her with so much anxious care that she was never free from tension, and such a state is notoriously unfavourable to the peristaltic function.

142] It is my conviction that it is absolutely essential for any teacher who wishes to apply the principles of analytical psychology to have a first-hand knowledge of the psychopathology of childhood and its attendant dangers. Unfortunately, there are certain books on psychoanalysis which give the impression that it is all very simple and that success can be had for the asking. No competent psychiatrist could endorse such superficial notions, and no warning can be too emphatic against unskilled and frivolous attempts to analyse children. There is no doubt that it is of the greatest value to the educator to know what modern psychology has contributed to the understanding of the child mind. But anyone who wishes to apply analytical

methods to children must have thorough knowledge of the pathological conditions he will be called upon to deal with. I must confess that I do not see how anyone, except a responsible physician, can dare to analyse children without special knowledge and medical advice.

143] To analyse children is a most difficult and delicate task. The conditions under which we have to work are altogether different from those governing the analysis of grown-ups. The child has a special psychology. Just as its body during the embryonic period is part of the mother's body, so its mind is for many years part of the parents' mental atmosphere. That explains why so many neuroses of children are more symptoms of the mental condition of the parents than a genuine illness of the child. Only a very little of the child's psychic life is its own; for the most part it is still dependent on that of the parents. Such dependence is normal, and to disturb it is injurious to the natural growth of the child's mind. It is therefore understandable that premature and indelicate enlightenment on the facts of sex can have a disastrous effect on his relations with his parents, and such an effect is almost inevitable if you base your analysis on the dogma that the relations between parents and children are necessarily sexual.

144] It is no less unjustifiable to give the so-called Oedipus complex the status of a prime cause. The Oedipus complex is a symptom. Just as any strong attachment to a person or a thing may be described as a "marriage," and just as the primitive mind can express almost anything by using a sexual metaphor, so the regressive tendency of a child may be described in sexual terms as an "incestuous longing for the mother." But it is no more than a figurative way of speaking. The word "incest" has a definite meaning, and designates a definite thing, and as a general rule can only be applied to an adult who is psychologically incapable of linking his sexuality to its proper object. To apply the same term to the difficulties in the development of a child's consciousness is highly misleading.

145] This is not to say that sexual precocity does not exist. But such cases are distinctly exceptional and abnormal, and there is nothing to justify the doctor in extending the concepts of pathology to the sphere of the normal. Just as it is hardly permissible to call blushing a skin disease, or joy a fit of madness, so cruelty is not necessarily sadism, pleasure is not necessarily lust, and firmness is not necessarily sexual repression.

146] In studying the history of the human mind one is impressed again and again by the fact that its growth keeps pace with a widening range of consciousness, and that each step forward is an extremely painful and laborious achievement. One could almost say that nothing is more hateful to man than to give up the smallest particle of unconsciousness. He has a profound fear of the unknown. Ask anybody who has ever tried to introduce new ideas! If even the allegedly mature man is afraid of the

unknown, why shouldn't the child hesitate also? The *horror novi* is one of the most striking qualities of primitive man. This is a natural enough obstacle, as obstacles go; but excessive attachment to the parents is unnatural and pathological, because a too great fear of the unknown is itself pathological. Hence one should avoid the one-sided conclusion that hesitation in advancing is necessarily due to sexual dependence on the parents. Often it may be simply a *reculer pour mieux sauter*. Even in cases where children do exhibit sexual symptoms—where, in other words, the incestuous tendency is perfectly obvious—I should recommend a careful examination of the parents' psyche. One finds astonishing things, such as a father unconsciously in love with his own daughter, a mother who is unconsciously flirting with her son, imputing under the cover of unconsciousness their own adult emotions to their children, who, again unconsciously, act the parts allotted to them. Children will not of course play these strange and unnatural roles unless unconsciously forced into them by their parents' attitude.

147] I will now describe one such case. There was a family of four children, two daughters and two sons. All four were neurotic. The girls had shown neurotic symptoms since before puberty. I shall avoid unnecessary details, sketching the fate of the family only in broad outline.

148] The elder daughter, when she was twenty, fell in love with an eminently suitable young man of good family and a university education. The marriage, however, was put off for one reason or another, and, as though hypnotized, she started an affair with one of her father's office employees. She seemed to love her fiancé very much, but was so prudish with him that she never allowed him even to kiss her, while she went very far with the other man without the slightest hesitation. She was excessively naïve and childish, and totally unconscious at first of what she was doing. Then, to her unspeakable horror, the full consciousness of it came over her. She broke down completely, and for years she suffered from hysteria. She severed her connection with the employee and also with her fiancé without explaining her conduct to anyone.

149] The second daughter got married, apparently with no difficulties, but to a man below her mental level. She was frigid and remained childless. In less than a year she had fallen so passionately in love with a friend of her husband's that it developed into a long-drawn-out love affair.

150] The elder son, in himself a talented young man, showed the first signs of neurotic indecision when it came to choosing a career. Eventually he decided to study chemistry, but he had no sooner begun than he was overwhelmed with such a homesickness that he left the university and went straight home to mother. There he fell into a peculiar state of mental confusion with hallucinations, and when this state subsided again after about six weeks, he resolved to take up medicine. He actually

went so far as to sit for the examination. Soon afterwards he became engaged. Hardly was the engagement a fact than he began to doubt the rightness of his choice; then came anxiety states and the engagement was broken off. Thereupon he went right off his head and had to be shut up in an asylum for several months.

151] The second son was a psychasthenic neurotic, a woman-hater who seriously planned to remain a bachelor all his life and clung to his mother in the most sentimental way.

152] I was called in to deal with all four children. In each case the history pointed back unmistakably to the mother's secret. Eventually I learned her story. She was a talented, vivacious woman, who in her young days had received a strict, very one-sided and narrow education. With the utmost severity towards herself and with remarkable strength of character she had adhered all her life to the principles implanted in her, and allowed herself no exceptions. She had not long been married when she got to know a friend of her husband's, and fell obviously in love with him. It was equally obvious to her that this love was fully reciprocated. But her principles made no provision for such an eventuality, therefore it had no right to exist. She always behaved as if nothing were amiss, and she kept up the part for over twenty years until the death of this man, with never a word spoken on either side. Her relations with her husband were distant and correct. In later years she suffered from periodic melancholia.

153] Naturally such a state of affairs could not fail to create a very oppressive atmosphere in the home, and nothing influences children more than these silent facts in the background. They have an extremely contagious effect on the children. The daughters unconsciously imitated their mother's attitude,⁷ while the sons sought compensation by remaining, as it were, unconscious lovers, the unconscious love being over-compensated by their conscious rejection of women.

154] As one can imagine, it is not at all easy in practice to deal with such cases. Treatment should really have begun with the mother, or rather with the relations between the father and the mother. I think that an all-round conscious realization of the situation and its implications would have had a salutary effect. Conscious realization prevents the unmentionable atmosphere, the general cluelessness, the blank disregard of the troublesome object; in short, it stops the painful content from being repressed. And though this may seem to cause the individual more suffering, he is at least suffering meaningfully and from something real. Repression has the apparent advantage of clearing the conscious mind of worry, and the spirit of all its troubles, but, to counter that, it causes an indirect suffering from something unreal, namely a neurosis. Neurotic suffering is an unconscious fraud and has no moral merit, as has real suffering. Apart, however, from producing a neurosis the repressed cause of the suffering has other effects: it radiates out into the environment and, if

there are children, infects them too. In this way neurotic states are often passed on from generation to generation, like the curse of Atreus. The children are infected indirectly through the attitude they instinctively adopt towards their parents' state of mind: either they fight against it with unspoken protest (though occasionally the protest is vociferous) or else they succumb to a paralysing and compulsive imitation. In both cases they are obliged to do, to feel, and to live not as *they* want, but as their parents want. The more "impressive" the parents are, and the less they accept their own problems (mostly on the excuse of "sparing the children"), the longer the children will have to suffer from the un-lived life of their parents and the more they will be forced into fulfilling all the things the parents have repressed and kept unconscious. It is not a question of the parents having to be "perfect" in order to have no deleterious effects on their children. If they really were perfect, it would be a positive catastrophe, for the children would then have no alternative but moral inferiority, unless of course they chose to fight the parents with their own weapons, that is, copy them. But this trick only postpones the final reckoning till the third generation. The repressed problems and the suffering thus fraudulently avoided secrete an insidious poison which seeps into the soul of the child through the thickest walls of silence and through the whited sepulchres of deceit, complacency, and evasion. The child is helplessly exposed to the psychic influence of the parents and is bound to copy their self-deception, their insincerity, hypocrisy, cowardice, self-righteousness, and selfish regard for their own comfort, just as wax takes up the imprint of the seal. The only thing that can save the child from unnatural injury is the efforts of the parents not to shirk the psychic difficulties of life by deceitful manoeuvres or by remaining artificially unconscious, but rather to accept them as tasks, to be as honest with themselves as possible, and to shed a beam of light into the darkest corners of their souls. If they can confess to an understanding ear, so much the better. If for certain reasons they cannot, that is admittedly an aggravation, but not a disadvantage—on the contrary, it is often an advantage, for they are then forced to cope unaided with the thing that is most difficult for them. Public confession, as in the Salvation Army or the Oxford Group, is extremely effective for simple souls who can unbosom themselves *ex profundis*. But such souls are not exactly at home in a fashionable drawing-room, nor are such confessions to be heard there, however indiscreet. Confession, as we know, can also be used for self-deception. The more intelligent and cultured a man is, the more subtly he can humbug himself. No moderately intelligent person should believe himself either a saint or a sinner. Both would be a conscious lie. Rather he should keep shamefacedly silent about his moral qualities, ever mindful of his abysmal sinfulness on the one hand, and of his meritoriously humble insight into this desolate state of affairs on the other. All that the younger Blumhardt⁸ remarked to an acquaintance of mine, on his making an agonizingly contrite confession of sin, was:

“Do you think God is interested in your miserable muck?” Blumhardt had evidently noted the trick that makes drawing-room confession so attractive.

155] It is not, let me repeat, a question of the parents committing no faults—that would be humanly impossible—but of their recognizing them for what they are. It is not life that must be checked, but unconsciousness; above all, the unconsciousness of the educator. But that means our own unconsciousness, because each one of us is, for better or worse, the educator of his fellow man. For so morally bound up with one another are we human beings that a leader leads the led, and the led mislead the leader.

LECTURE TWO

156] Scientific psychology, to begin with, was either physiological psychology, or a rather unorganized accumulation of observations and experiments dealing with isolated facts and functions. Freud's hypothesis, though certainly one-sided, gave it a liberating push towards a psychology of psychic complexities. His work is really a psychology of the ramifications of the sexual instinct in the human psyche. But despite the undeniable importance of sex, one should not suppose that sex is everything. Such a broad hypothesis is like wearing coloured spectacles: it obliterates the finer shades so that everything is seen under the same lurid hue. It is therefore significant that Freud's first pupil, Alfred Adler, framed an entirely different hypothesis of equally broad applicability. The Freudians usually fail to mention Adler's merits, as they make a fanatical creed of their sex-hypothesis. But fanaticism is always a compensation for hidden doubt. Religious persecutions occur only where heresy is a menace. There is no instinct in man that is not balanced by another instinct. Sex would be absolutely unchecked in man were there not a balancing factor in the form of an equally important instinct destined to counteract an unbridled and therefore destructive functioning of the sexual instinct. The structure of the psyche is not unipolar. Just as sex is a force that sways man with its compelling impulses, so there is a natural force of self-assertion in him which enables him to resist emotional explosions. Even among primitives we find the severest restrictions imposed not only on sex but on other instincts too, without there being any need of the Ten Commandments or of the precepts of the catechism. All restrictions on the blind operation of sex derive from the instinct of self-preservation, which is what Adler's self-assertion amounts to in practice. Unfortunately, Adler in his turn goes too far and, by almost entirely neglecting the Freudian point of view, falls into the same error of one-sidedness and exaggeration. His psychology is the psychology of all the self-assertive tendencies in the human psyche. I admit that a one-sided truth has the advantage of simplicity, but whether it is an adequate hypothesis is another matter. We ought to be able to see that there is much in the psyche that depends on sex—sometimes, indeed, everything; but that at other times very little depends on sex and nearly everything on the instinct of self-preservation, or the power instinct, as Adler called it. Both Freud and Adler make the mistake of assuming the continuous operation of one and the same instinct, as though it were a chemical component that was always present in the same quantity, like the two hydrogen atoms in water. If that were the case, man would be mainly sexual, according to Freud, and mainly self-assertive, according to Adler. But he

cannot be both at the same time. Everyone knows that the instincts vary in intensity. Sometimes sex predominates, sometimes self-assertion or some other instinct. That is the simple fact which both investigators have overlooked. When sex predominates, everything becomes sexualized, since everything then expresses or serves the sexual purpose. When hunger predominates, practically everything has to be explained in terms of food. Why do we say, "Don't take him seriously, it's his bad day today"? Because we know that a man's psychology can be profoundly altered by a bad mood. This is even more true when dealing with powerful instincts. Freud and Adler can easily be reconciled if only we will take the trouble to regard the psyche not as a rigid and unalterable system, but as a fluid stream of events which change kaleidoscopically under the alternating influence of different instincts. Hence we may have to explain a man on the Freudian basis before his marriage, and on the Adlerian basis afterwards, which common sense has done all along.¹ Such a combination, however, leaves us in a rather uncomfortable situation. Instead of enjoying the apparent certainty of a single, simple truth, we feel ourselves castaways on a boundless sea of ever-changing conditions, helplessly tossed from one vagary to the next. The protean life of the psyche is a greater, if more inconvenient, truth than the rigid certainty of the one-eyed point of view. It certainly does not make the problems of psychology any easier. But it does free us from the incubus of "nothing but," which is the insistent leitmotiv of all one-sidedness.

157] As soon as the discussion comes to grips with the problem of instinct, everything gets into a dreadful muddle. How are we to distinguish the instincts from one another? How many instincts are there? What are instincts anyway? Thus you immediately get involved in biology and find yourself in more of a muddle than ever. I would therefore advise restriction to the psychological sphere without any assumptions as to the nature of the underlying biological process. The day may come when the biologist, and maybe even the physiologist, will be able to reach out his hand to the psychologist at the point where they meet after tunnelling from opposite sides through the mountain of the unknown.² In the meantime, we must learn to be a little more modest in the face of the psychological facts: instead of knowing so exactly that certain things are "nothing but" sex or "nothing but" the will to power, we should take them more at their face value. Consider religious experience, for instance. Can science be so sure that there is no such thing as a "religious instinct"? Can we really suppose that the religious phenomenon is nothing but a secondary function based on the repression of sex? Can anyone show us those "normal" peoples or races who are free from such silly repressions? But if no one can point to any race, or even a tribe, which is quite free from religious phenomena, then I really do not see how one can justify the argument that religious phenomena are not genuine and are merely repressions of sex. Moreover, has not history

provided us with plenty of examples where sex is actually an integral part of religious experience? The same is true of art, which is likewise supposed to be the result of sexual repressions, although even animals have aesthetic and artistic instincts. This ridiculous and well-nigh pathological exaggeration of the importance of sex is itself a symptom of the contemporary spiritual unbalance, owing chiefly to the fact that our age lacks a true understanding of sexuality.³ Whenever an instinct has been underrated, an abnormal overvaluation is bound to follow. And the more unjust the undervaluation the more unhealthy the subsequent overvaluation. As a matter of fact, no moral condemnation could make sex as hateful as the obscenity and blatant vulgarity of those who exaggerate its importance. The intellectual crudeness of the sexual interpretation makes a right valuation of sex impossible. Thus, probably very much against the personal aspirations of Freud himself, the literature that has followed in his wake is effectively carrying on the work of repression. Before Freud nothing was allowed to be sexual, now everything is nothing but sexual.

158] The preoccupation with sex in psychotherapy is due firstly to the assumption that fixation to the parental imagos is by nature sexual, and secondly to the fact that with many patients sexual fantasies, or those that appear to be such, predominate. Freudian doctrine explains all this in the well-known sexual manner with the laudable intent of freeing the patient from his so-called “sexual” fixation to the parental imagos and initiating him into “normal” life. It speaks, plainly enough, the same language as the patient,⁴ and in suitable cases this is of course a distinct advantage, though it becomes a disadvantage as time goes on, because the sexual terminology and ideology bind the problem down to the very level on which it has shown itself to be insoluble. The parents are not just “sexual objects” or “pleasure objects” to be dismissed out of hand; they are, or they represent, vital forces which accompany the child on the winding path of destiny in the form of favourable or dangerous factors, from whose influence even the adult can escape only in limited degree, analysis or no analysis. Father and mother are, whether we know it or not, replaced by something analogous to them—if, that is to say, we succeed in detaching ourselves from them at all. The detachment is possible only if we can step on to the next level. For example, the place of the father is now taken by the doctor, a phenomenon which Freud called the “transference.” But in the place of the mother there is substituted the wisdom of a doctrine. And indeed the great prototype in the Middle Ages was the substitution of Mother Church for the family. In recent times worldly allegiances have taken the place of the spiritual organization of society, for to remain a permanent member of the family has very undesirable psychic consequences and is for that reason rendered impossible even in primitive society by the initiation ceremonies. Man needs a wider community than the family, in whose

leading-strings he will be stunted both spiritually and morally. If he is burdened with too much family, if, in later life, his tie to the parents is too strong, he will simply transfer the parental tie to the family he himself has raised (if he ever gets that far), thus creating for his own progeny the same suffocating psychic atmosphere from which he suffered in his youth.

159] No psychic allegiance to any kind of secular organization can ever satisfy the spiritual and emotional demands previously made on the parents. Moreover, it is by no means to the advantage of a secular organization to possess members who make such demands. One can see this clearly enough from the thoughtless expectations which the spiritually immature cherish in regard to "Father State"; and where such misguided yearnings ultimately lead is shown by those countries whose leaders, skilfully exploiting the infantile hopes of the masses by suggestion, have actually succeeded in arrogating to themselves the power and authority of the father. Spiritual impoverishment, stultification, and moral degeneracy have taken the place of spiritual and moral fitness, and produced a mass psychosis that can only lead to disaster. A man cannot properly fulfil even the biological meaning of human existence if this and this only is held up to him as an ideal. Whatever the shortsighted and doctrinaire rationalist may say about the meaning of culture, the fact remains that there is a culture-creating spirit. This spirit is a living spirit and not a mere rationalizing intellect. Accordingly, it makes use of a religious symbolism superordinate to reason, and where this symbolism is lacking or has met with incomprehension, things can only go badly with us. Once we have lost the capacity to orient ourselves by religious truth, there is absolutely nothing which can deliver man from his original biological bondage to the family, as he will simply transfer his infantile principles, uncorrected, to the world at large, and will find there a father who, so far from guiding him, leads him to perdition. Important as it is for a man to be able to earn his daily bread and if possible to support a family, he will have achieved nothing that could give his life its full meaning. He will not even be able to bring his children up properly, and will thus have neglected to take care of the brood, which is an undoubted biological ideal. A spiritual goal that points beyond the purely natural man and his worldly existence is an absolute necessity for the health of the soul; it is the Archimedean point from which alone it is possible to lift the world off its hinges and to transform the natural state into a cultural one.

160] Our psychology takes account of the cultural as well as the natural man, and accordingly its explanations must keep both points of view in mind, the spiritual and the biological. As a medical psychology, it cannot do otherwise than pay attention to the whole man. Since the average doctor has been educated exclusively in the natural sciences and is, therefore, accustomed to see everything as a "natural" phenomenon, it is only to be expected that he will understand psychic phenomena

from the same biological angle. This mode of observation has great heuristic value and opens out perspectives which were closed to all ages before us. Thanks to its empirical and phenomenological outlook we now know the facts as they really are; we know what is happening and how it happens, unlike earlier ages which usually had only doctrines and theories about the unknown. One can hardly overestimate the value of strictly scientific biological inquiry; it more than anything else has sharpened the eye of the psychiatrist for factual data and made possible a method of description closely approximating to reality. But this apparently self-evident procedure is not, as it happens, self-evident at all, or rather, in no field of experience is the eye for facts so myopic as in the psyche's perception and observation of itself. Nowhere do prejudices, misinterpretations, value-judgments, idiosyncrasies, and projections trot themselves out more glibly and unashamedly than in this particular field of research, regardless of whether one is observing oneself or one's neighbour. Nowhere does the observer interfere more drastically with the experiment than in psychology. I am tempted to say that one can never verify facts enough, because psychic experience is so extremely delicate and is moreover exposed to countless disturbing influences.

161] Nor should we omit to mention that whereas in all other departments of natural science a physical process is observed by a psychic process, in psychology the psyche observes itself, directly in the subject, indirectly in one's neighbour. One is reminded of the story of the topknot of Baron Munchausen, and consequently one comes to doubt whether psychological knowledge is possible at all. In this matter too the doctor feels grateful to natural science that he does not have to philosophize, but can enjoy living knowledge in and through the psyche. That is to say, although the psyche can never know anything *beyond* the psyche (that would be sheer Baron Munchausen!), it is still possible for two strangers to meet within the sphere of the psychic. They will never know themselves as they are, but only as they appear to one another. In the other natural sciences, the question of what a thing is can be answered by a knowledge that goes beyond the thing in question, namely by a psychic reconstruction of the physical process. But in what, or through what, can the psychic process be repeated? It can only be repeated in and through the psychic; in other words, there is no knowledge *about* the psyche, but only *in* the psyche.

162] Although, therefore, the medical psychologist mirrors the psychic in the psychic, he nevertheless remains, consistently with his empirical and phenomenological approach, within the framework of natural science; but at the same time he departs from it in principle in so far as he undertakes his reconstruction—knowledge and explanation—not in another medium, but in the same medium. Natural science combines two worlds, the physical and the psychic. Psychology does this only in so far as it is psychophysiology. As “pure” psychology its principle of explanation is

ignotum per ignotius, for it can reconstruct the observed process only in the same medium from which that process is itself constituted. It is rather as if the physicist were unable to do anything except repeat the physical process in all its possible variations, without the aid of any *theoria*. But every psychic process, so far as it can be observed as such, is essentially *theoria*, that is to say, it is a *presentation*; and its reconstruction—or “re-presentation”—is at best only a variant of the same presentation. If it is not that, it is just a compensatory attempt to improve or to find fault, or a piece of polemic or criticism; in either case it means the annulment of the process to be reconstructed. To adopt such a procedure in psychology is about as scientific as the paleontology of the eighteenth century, which interpreted *Andrias Scheuchzeri* (the giant salamander) as a human being who had been drowned in the Flood. This problem becomes acute when we have to do with contents which are difficult to understand, such as dream-images, manic ideas, and the like. Here the interpretation must guard against making use of any other viewpoints than those manifestly given by the content itself. If someone dreams of a lion, the correct interpretation can only lie in the direction of the lion; in other words, it will be essentially an *amplification* of this image. Anything else would be an inadequate and incorrect interpretation, since the image “lion” is a quite unmistakable and sufficiently positive presentation. When Freud asserts that the dream means something other than what it says, this interpretation is a “polemic” against the dream’s natural and spontaneous presentation of itself, and is therefore invalid. A scientifically responsible interpretation which proceeds along the line of the image it wishes to interpret cannot be called a tautology; on the contrary, it enlarges the meaning of the image until it becomes, through amplification, a generally valid concept. Even a mathematical grasp of the psyche, were such a thing possible, could only be an algebraically expressed expansion of its meaning. Fechner’s psychophysics is just the opposite of this, being an acrobatic attempt to jump over its own head.

163] At this crucial point psychology stands outside natural science. Although sharing with the latter its method of observation and the empirical verification of fact, it lacks the Archimedean point outside and hence the possibility of objective measurement. To that extent psychology is at a disadvantage compared with natural science. Only one other science finds itself in a similar situation, and that is atomic physics, where the process to be observed is modified by the observer. As physics has to relate its measurements to objects, it is obliged to distinguish the observing medium from the thing observed,⁵ with the result that the categories of space, time, and causality become relative.

164] This strange encounter between atomic physics and psychology has the inestimable advantage of giving us at least a faint idea of a possible Archimedean

point for psychology. The microphysical world of the atom exhibits certain features whose affinities with the psychic have impressed themselves even on the physicists.⁶ Here, it would seem, is at least a suggestion of how the psychic process could be “reconstructed” in another medium, in that, namely, of the microphysics of matter. Certainly no one at present could give the remotest indication of what such a “reconstruction” would look like. Obviously it can only be undertaken by nature herself, or rather, we may suppose it to be happening continuously, all the time the psyche perceives the physical world. The case of psychology versus natural science is not altogether hopeless, even though, as said, the issue lies beyond the scope of our present understanding.

165] Psychology can also claim to be one of the humane sciences, or, as they are called in German, the *Geisteswissenschaften*, sciences of the mind. All these sciences of the mind move and have their being within the sphere of the psychic, if we use this term in its limited sense, as defined by natural science. From that point of view “mind” is a psychic phenomenon.⁷ But, even as a science of the mind, psychology occupies an exceptional position. The sciences of law, history, philosophy, theology, etc., are all characterized and limited by their subject-matter. This constitutes a clearly defined mental field, which is itself, phenomenologically regarded, a psychic product. Psychology, on the other hand, though formerly counted a discipline of philosophy, is today a natural science and its subject-matter is not a mental product but a natural phenomenon, i.e., the psyche. As such it is among the elementary manifestations of organic nature, which in turn forms one half of our world, the other half being the inorganic. Like all natural formations, the psyche is an irrational datum. It appears to be a special manifestation of life and to have this much in common with living organisms that, like them, it produces meaningful and purposeful structures with the help of which it propagates and continually develops itself. And just as life fills the whole earth with plant and animal forms, so the psyche creates an even vaster world, namely consciousness, which is the self-cognition of the universe.

166] In respect of its natural subject-matter and its method of procedure, modern empirical psychology belongs to the natural sciences, but in respect of its method of explanation it belongs to the humane sciences.⁸ On account of this “ambiguity” or “double valence,” doubts have been raised as to its scientific character, firstly on the score of this same ambivalence, secondly, on that of its alleged “arbitrariness.” As to the latter point, it should not be forgotten that there are certain people who regard their psychic processes as purely arbitrary acts. They are naively convinced that everything they think, feel, want, and so on, is a product of their wills and is therefore “arbitrary.” They believe that they think their own thoughts and want their own wants, there being no other subject of these activities except themselves. It is

apparently impossible for them to admit that psychic activity could ever be carried on without a subject (in this case, of course, the ego). They balk at the idea that the psychic content, which they imagine they themselves have produced, exists in its own right, and is apparently far more the product of itself or of a will other than that of the ego.

167] Here we are up against a fashionable and widespread illusion in favour of the ego. In French they even go so far as to say “J’ai fait un rêve,” although the dream is the one psychic content which least of all can be said to have been deliberately willed or created. Conversely, although German possesses the admirable expression “Einfall,”⁹ nobody who “had a good idea” would feel the slightest compunction about chalking up this lucky fluke to his own account, as though it were something he had manufactured himself. But that, as the word “Einfall” clearly shows, is precisely not the case, firstly because of the obvious incapacity of the subject, and secondly because of the manifest spontaneity of the trans-subjective psyche. We therefore say in German, as well as in French and English, “The idea occurred to me,” which is absolutely correct, seeing that the agent is not the subject but the idea, and that the idea literally dropped in through the roof.

168] These examples point to the objectivity of the psyche: it is a natural phenomenon and nothing “arbitrary.” The will, too, is a phenomenon, though “free will” is not a natural phenomenon because it is not observable in itself, but only in the form of concepts, views, convictions, or beliefs. It is therefore a problem which belongs to a pure “science of the mind.” Psychology has to confine itself to natural phenomenology if it is not to go poaching on other preserves. But the verification of the psyche’s phenomenology is no simple matter, as we can see from this popular illusion concerning the “arbitrariness” of psychic processes.

169] As a matter of fact, there do exist psychic contents which are produced or caused by an antecedent act of the will, and which must therefore be regarded as products of some intentional, purposive, and conscious activity. To that extent a fair proportion of psychic contents are *mental* products. Yet the will itself, like the willing subject, is a phenomenon which rests on an unconscious background, where consciousness appears only as the intermittent functioning of an unconscious psyche. The ego, the subject of consciousness, comes into existence as a complex quantity which is constituted partly by the inherited disposition (character constituents) and partly by unconsciously acquired impressions and their attendant phenomena. The psyche itself, in relation to consciousness, is pre-existent and transcendent. We could therefore describe it, with du Prel,¹⁰ as the transcendental subject.

170] Analytical psychology differs from experimental psychology in that it does not attempt to isolate individual functions (sense functions, emotional phenomena,

thought-processes, etc.) and then subject them to experimental conditions for purposes of investigation. It is far more concerned with the total manifestation of the psyche as a natural phenomenon—a highly complex structure, therefore, even though critical examination may be able to divide it up into simpler component complexes. But even these components are extremely complicated and, in their basic features, inscrutable. The boldness of our psychology in daring to operate with such unknowns would be presumptuous indeed, were it not that a higher necessity absolutely requires its existence and affords it help. We doctors are forced, for the sake of our patients, to treat obscure complaints which are hard or impossible to understand, sometimes with inadequate and therapeutically doubtful means, and to summon up the necessary courage and the right feeling of responsibility. We have, for professional reasons, to tackle the darkest and most desperate problems of the soul, conscious all the time of the possible consequences of a false step.

171] The difference between this and all earlier psychologies is that analytical psychology does not hesitate to tackle even the most difficult and complicated processes. Another difference lies in our method of procedure. We have no laboratory equipped with elaborate apparatus. Our laboratory is the world. Our tests are concerned with the actual, day-to-day happenings of human life, and the test-subjects are our patients, relatives, friends, and, last but not least, ourselves. Fate itself plays the role of experimenter. There are no needle-pricks, artificial shocks, surprise-lights, and all the paraphernalia of laboratory experiment; it is the hopes and fears, the pains and joys, the mistakes and achievements of real life that provide us with our material.

172] Our aim is the best possible understanding of life as we find it in the human soul. What we learn through understanding will not, I sincerely hope, petrify into intellectual theory, but will become an instrument which, through practical application, will improve in quality until it can serve its purpose as perfectly as possible. Its main purpose is the better adaptation of human behaviour, and adaptation in two directions (illness is faulty adaptation). The human being must be adapted on two fronts, firstly to external life—profession, family, society—and secondly to the vital demands of his own nature. Neglect of the one or the other imperative leads to illness. Although it is true that anyone whose unadaptedness reaches a certain point will eventually fall ill, and will therefore also be a failure in life, yet not everybody is ill merely because he cannot meet the demands of the outside world, but rather because he does not know how to use his external adaptedness for the good of his most personal and intimate life and how to bring it to the right pitch of development. Some people become neurotic for external reasons, others for internal ones. It can easily be imagined how many different psychological formulations there must be in order to do justice to such diametrically

opposite types. Our psychology inquires into the reasons for the pathogenic failure to adapt, following the slippery trail of neurotic thinking and feeling until it finds the way back to life. Our psychology is therefore an eminently practical science. It does not investigate for investigation's sake, but for the immediate purpose of giving help. We could even say that learning is its by-product, but not its principal aim, which is again a great difference from what one understands by "academic" science.

173] It is obvious that the purpose and inmost meaning of this new psychology is educational as well as medical. Since every individual is a new and unique combination of psychic elements, the investigation of truth must begin afresh with each case, for each "case" is individual and not derivable from any preconceived formula. Each individual is a new experiment of life in her ever-changing moods, and an attempt at a new solution or new adaptation. We miss the meaning of the individual psyche if we interpret it on the basis of any fixed theory, however fond of it we may be. For the doctor this means the individual study of every case; for the teacher, the individual study of every pupil. I do not mean that you should begin each investigation from the very bottom. What you already understand needs no investigating. I speak of "understanding" only when the patient or pupil can agree with the interpretations offered; understanding that goes over your patient's head is an unsafe business for both. It might be fairly successful with a child, but certainly not with an adult of any mental maturity. In any case of disagreement the doctor must be ready to drop all his arguments for the sole purpose of finding the truth. There are naturally cases where the doctor sees something which is undoubtedly there, but which the patient will not or cannot admit. As the truth is often hidden as much from the doctor as from the patient, various methods have been evolved for gaining access to the unknown contents. I purposely say "unknown" and not "repressed" because I think it altogether wrong to assume that whenever a content is unknown it is necessarily repressed. The doctor who really thinks that way gives the appearance of knowing everything beforehand. Such a pretence stymies the patient and will most likely make it impossible for him to confess the truth. At all events the know-all attitude takes the wind out of his sails, though this is sometimes not altogether unwelcome to him, as he can then guard his secret the more easily, and it is so much more convenient to have his truth handed to him by the analyst than be forced to realize and confess it himself. In this way nobody is the gainer. Moreover, this superior knowing in advance undermines the patient's independence of mind, a most precious quality that should on no account be injured. One really cannot be careful enough, as people are incredibly eager to be rid of themselves, running after strange gods whenever occasion offers.

174] There are four methods of investigating the unknown in a patient.

175] The first and simplest method is the ASSOCIATION METHOD. I do not think I need go into details here, as this method has been known for the last fifty years. Its principle is to discover the main complexes through disturbances in the association experiment. As an introduction to analytical psychology and to the symptomatology of complexes, this method is recommended for every beginner.¹¹

176] The second method, SYMPTOM-ANALYSIS, has a merely historical value and was given up by Freud, its originator, long ago. By means of hypnotic suggestion it was attempted to get the patient to reproduce the memories underlying certain pathological symptoms. The method works very well in all cases where a shock, a psychic injury, or a trauma is the chief cause of the neurosis. It was on this method that Freud based his earlier trauma theory of hysteria. But since most cases of hysteria are not of traumatic origin, this theory was soon discarded along with its method of investigation. In a case of shock the method can have a therapeutic effect through “abreaction” of the traumatic content. During and after the first World War it was useful in treating shell-shock and similar disorders.¹²

177] The third method, ANAMNESTIC ANALYSIS, is of greater importance as a method both of investigation and of therapy. In practice it consists in a careful anamnesis or reconstruction of the historical development of the neurosis. The material elicited in this way is a more or less coherent sequence of facts told to the doctor by the patient, so far as he can remember them. He naturally omits many details which either seem unimportant to him or which he has forgotten. The experienced analyst who knows the usual course of neurotic development will put questions which help the patient to fill in some of the gaps. Very often this procedure by itself is of great therapeutic value, as it enables the patient to understand the chief factors of his neurosis and may eventually bring him to a decisive change of attitude. It is of course as unavoidable as it is necessary for the doctor not only to ask questions, but to give hints and explanations in order to point out important connections of which the patient is unconscious. While serving as an officer in the Swiss Army Medical Corps, I often had occasion to use this anamnestic method. For instance, there was a nineteen-year-old recruit who reported sick. When I saw the young man he told me straight out that he was suffering from inflammation of the kidneys and that that was the cause of his pains. I wondered how he knew his diagnosis so definitely, whereupon he said that an uncle of his had the same trouble and the same pains in the back. The examination, however, revealed no trace of organic disease. It was obviously a neurosis. I asked for his previous history. The main fact was that the young man had lost both parents rather early and now lived with the uncle he had just mentioned. This uncle was his foster-father, of whom he was very fond. The day before he reported sick he received a letter from his uncle, telling him that he was laid up again with nephritis. The letter affected him unpleasantly and he threw it

away at once, without realizing the true cause of the emotion he was trying to repress. Actually, he was very much afraid lest his foster-father should die, and this put him in mind again of his grief at the loss of his parents. As soon as he realized this he had a violent fit of weeping, with the result that he joined the ranks again next morning. It was a case of identification with the uncle, which was uncovered by the anamnesis. The realization of his suppressed emotions had a therapeutic effect.

178] A similar case was that of another recruit, who for weeks before I saw him had been having medical treatment for stomach trouble. I suspected that he was neurotic. The anamnesis revealed that the trouble began when he heard the news that his aunt, who was like a mother to him, had to undergo an operation for cancer of the stomach. Here again the uncovering of the hidden connection had curative results. Simple cases of this kind are quite common, and are accessible to anamnestic analysis. In addition to the favourable effect produced by the realization of previously unconscious connections, it is usual for the doctor to give some good advice, or encouragement, or even a reproof.

179] This is the best practical method for the treatment of neurotic children. With children you cannot very well apply the method of dream-analysis, as it penetrates deep into the unconscious. In the majority of cases you have simply to clear away certain obstacles, and this can be done without much technical knowledge. Generally speaking, a child's neurosis would be a very simple matter were it not that there is an invariable connection between it and the wrong attitude of the parents. This complication buttresses the child's neurosis against all therapeutic intervention.

180] The fourth method is the ANALYSIS OF THE UNCONSCIOUS. Despite the fact that anamnestic analysis can reveal certain facts of which the patient is unconscious, it is not what Freud would have called "psychoanalysis." In reality there is a remarkable difference between the two methods. The anamnestic method, as I pointed out, deals with conscious contents, or with contents ready for reproduction, while the analysis of the unconscious only begins when the conscious material is exhausted. I beg to point out that I do not call this fourth method "psychoanalysis," as I wish to leave that term entirely to the Freudians. What they understand by psychoanalysis is no mere technique, but a method which is dogmatically bound up with and based upon Freud's sexual theory. When Freud publicly declared that psychoanalysis and his sexual theory were indissolubly wedded, I was obliged to strike out on a different path, as I was unable to endorse his one-sided views. That is also the reason why I prefer to call this fourth method the analysis of the unconscious.

181] As I have emphasized above, this method can only be applied when the conscious contents are exhausted. By this I mean that analysis of the unconscious is possible only after all the conscious material has been properly examined and there is still no satisfactory explanation and solution of the conflict. The anamnestic method often

serves as an introduction to the fourth method. By careful examination of his conscious mind you get to know your patient; you establish what the old hypnotists used to call "rapport." This personal contact is of prime importance, because it forms the only safe basis from which to tackle the unconscious. This is a factor that is frequently overlooked, and when it is neglected it may easily lead to all sorts of blunders. Even the most experienced judge of human psychology cannot possibly know the psyche of another individual, so he must depend upon goodwill, i.e., good contact with the patient, and trust him to tell the analyst when anything goes wrong. Very often misunderstandings occur right at the beginning of the treatment, sometimes through no fault of the doctor. Owing to the very nature of his neurosis, the patient will harbour all kinds of prejudices which are often the direct cause of his neurosis and help to keep it alive. If these misunderstandings are not thoroughly cleared up, they can easily leave behind them a feeling of resentment which reduces all your subsequent efforts to nothing. Of course, if you begin the analysis with a fixed belief in some theory which purports to know all about the nature of neurosis, you apparently make your task very much easier; but you are nevertheless in danger of riding roughshod over the real psychology of your patient and of disregarding his individuality. I have seen any number of cases where the cure was hindered by theoretical considerations. Without exception the failure was due to lack of contact. It is only the most scrupulous observation of this rule that can prevent unforeseen catastrophes. So long as you feel the human contact, the atmosphere of mutual confidence, there is no danger; and even if you have to face the terrors of insanity, or the shadowy menace of suicide, there is still that area of human faith, that certainty of understanding and of being understood, no matter how black the night. It is by no means easy to establish such a contact, and you cannot achieve it at all except by a careful comparison of both points of view and by mutual freedom from prejudice. Mistrust on either side is a bad beginning, and so is the forcible breaking down of resistances through persuasion or other coercive measures. Even conscious suggestion as part of the analytical procedure is a mistake, because the patient's feeling of being free to make up his own mind must at all costs be preserved. Whenever I discover the slightest trace of mistrust or resistance I try to take it with the utmost seriousness so as to give the patient a chance to re-establish the contact. The patient should always have a firm foothold in his conscious relation to the doctor, who in his turn needs that contact if he is to be sufficiently informed about the actual state of the patient's consciousness. He needs this knowledge for very practical reasons. Without it, he would not be able to understand his patient's dreams correctly. Therefore, not only in the beginning, but during the whole course of an analysis the personal contact must be the main point of observation, because it alone can prevent extremely disagreeable and surprising discoveries, as well as fatal issues so far as is humanly possible. And not only that, it is above all else a means for

correcting the false attitude of the patient, in such a way that he does not feel he is being persuaded against his will or actually outwitted.

182] I should like to give you an illustration of this. A young man of about thirty, obviously very clever and highly intellectual, came to see me, not, he said, for treatment, but only in order to ask one question. He produced a voluminous manuscript, which, so he said, contained the history and analysis of his case. He called it a compulsion neurosis—quite correctly, as I saw when I read the document. It was a sort of psychoanalytical autobiography, most intelligently worked out and showing really remarkable insight. It was a regular scientific treatise, based on wide reading and a thorough study of the literature. I congratulated him on his achievement and asked him what he had really come for. “Well,” he said, “you have read what I have written. Can you tell me why, with all my insight, I am still as neurotic as ever? In theory I should be cured, as I have recalled even my earliest memories. I have read of many people who, with infinitely less insight than I have, were nevertheless cured. Why should I be an exception? Please tell me what it is I have overlooked or am still repressing.” I told him I could not at the moment see any reason why his really astonishing insight had not touched his neurosis. “But,” I said, “allow me to ask you for a little more information about yourself personally.” “With pleasure,” he replied. So I went on: “You mention in your autobiography that you often spend the winter in Nice and the summer in St. Moritz. I take it that you are the son of wealthy parents?” “Oh, no,” he said, “they are not wealthy at all.” “Then no doubt you have made your money yourself?” “Oh, no,” he replied, smiling. “But how is it then?” I asked with some hesitation. “Oh, that does not matter,” he said, “I got the money from a woman, she is thirty-six, a teacher in a council school.” And he added, “It’s a liaison, you know.” As a matter of fact this woman, who was a few years older than himself, lived in very modest circumstances on her meagre earnings as a teacher. She saved the money by stinting herself, naturally in the hope of a later marriage, which this delightful gentleman was not even remotely contemplating. “Don’t you think,” I asked, “that the fact that you are financially supported by this poor woman might be one of the chief reasons why you are not yet cured?” But he laughed at what he called my absurd moral innuendo, which according to him had nothing to do with the scientific structure of his neurosis. “Moreover,” he said, “I have discussed this point with her, and we are both agreed that it is of no importance.” “So you think that by the mere fact of having discussed this situation you have talked the other fact—the fact of your being supported by a poor woman—out of existence? Do you imagine you have any lawful right to the money jingling in your pockets?” Whereupon he rose and indignantly left the room, muttering something about moral prejudices. He was one of the many who believe that morals have nothing to do with neurosis and that

sinning on purpose is not sinning at all, because it can be intellectualized out of existence.

183] Obviously I had to tell this young gentleman what I thought of him. If we could have reached agreement on this point, treatment would have been possible. But if we had begun our work by ignoring the impossible basis of his life, it would have been useless. With views like his only a criminal can adapt to life. But this patient was not really a criminal, only a so-called intellectual who believed so much in the power of reason that he even thought he could unthink a wrong he had committed. I believe firmly in the power and dignity of the intellect, but only if it does not violate the feeling-values. These are not just infantile resistances. This example shows what a decisive factor the personal contact is.

184] When the anamnestic stage of analysis is over, that is, when all the conscious material—recollections, questions, doubts, conscious resistances, etc—has been sufficiently dealt with, one can then proceed to the analysis of the unconscious. With this, one enters a new sphere. From now on we are concerned with the living psychic process itself, namely with DREAMS.

185] Dreams are neither mere reproductions of memories nor abstractions from experience. They are the undisguised manifestations of unconscious creative activity. As against Freud's view that dreams are wish-fulfilments, my experience of dreams leads me to think of them as functions of compensation. When, in the course of analysis, the discussion of conscious material comes to an end, previously unconscious potentialities begin to become activated, and these may easily be productive of dreams. Let me give an example. An elderly lady of fifty-four, but comparatively well preserved, came to consult me about her neurosis, which had begun about one year after the death of her husband twelve years before. She suffered from numerous phobias. Naturally she had a long story to unfold of which I will only mention the fact that, after the death of her husband, she lived by herself in her beautiful country house. Her only daughter was married and lived abroad. The patient was a woman of superficial education only, with a narrow mental horizon, who had learnt nothing in the last forty years. Her ideals and convictions belonged to the eighteen-seventies. She was a loyal widow and clung to her marriage as best she could without her husband. She could not understand in the least what the reason for her phobias could be; certainly it was no question of morals, as she was a worthy member of the church. Such people believe as a rule only in physical causes: phobias have regularly to do with the "heart," or the "lungs," or the "stomach." But strangely enough the doctors had found nothing wrong with those organs. Now she no longer knew what to think about her illness. So I told her that henceforth we would try to see what her dreams had to say on the question of her phobias. Her dreams at that time had the character of snapshots: a gramophone playing a love-

song; herself as a young girl, just engaged; her husband as a doctor, and so on. It was quite obvious what they were hinting at. In discussing the problem I was very careful not to call such dreams “Wish-fulfilments,” as she was already far too much inclined to say of her dreams, “Oh, they are nothing but fancies, one dreams such foolish stuff sometimes!” It was very important that she should give serious attention to this problem and feel that it really did concern her. The dreams contained her real intentions, and had to be added to the other contents of consciousness in order to compensate her blind one-sidedness. I call dreams compensatory because they contain ideas, feelings, and thoughts whose absence from consciousness leaves a blank which is filled with fear instead of with understanding. She wished to know nothing about the meaning of her dreams, because she felt it was pointless to think about a question which could not be answered at once. But, like many other people, she failed to notice that by repressing disagreeable thoughts she created something like a psychic vacuum which, as usually happens, gradually became filled with anxiety. Had she troubled herself consciously with her thoughts she would have known what was lacking, and she would then have needed no anxiety states as a substitute for the absence of conscious suffering.

186] Clearly, then, the doctor must know the conscious standpoint of his patient if he wants to have a secure basis for understanding the compensatory intention of dreams.

187] Experience tells us that the meaning and content of dreams are closely related to the conscious attitude. Recurrent dreams correspond to equally recurrent conscious attitudes. In the case just given it is easy to see what the dreams meant. But suppose a young girl, newly engaged, had such dreams: it is certain that they would have quite a different meaning. The analyst, therefore, must have a very good knowledge of the conscious situation, because it may happen that the same dream-motifs mean one thing on one occasion and the exact opposite on another. It is practically impossible, and it is certainly not desirable, to interpret dreams without being personally acquainted with the dreamer. Sometimes, however, one comes across fairly intelligible dreams, particularly with people who know nothing about psychology, where personal knowledge of the dreamer is not necessary for interpretation. Once, on a train journey, I found myself with two strangers in the dining car. The one was a fine-looking old gentleman, the other a middle-aged man with an intelligent face. I gathered from their conversation that they were military men, presumably an old general and his adjutant. After a long silence, the old man suddenly said to his companion, “Isn’t it odd what you dream sometimes? I had a remarkable dream last night. I dreamed *I was on parade with a number of young officers, and our commander-in-chief was inspecting us. Eventually he came to me,*

but instead of asking a technical question he demanded a definition of the beautiful. I tried in vain to find a satisfactory answer, and felt most dreadfully ashamed when he passed on to the next man, a very young major, and asked him the same question. This fellow came out with a damned good answer, just the one I would have given if only I could have found it. This gave me such a shock that I woke up.” Then, suddenly and unexpectedly addressing me, a total stranger, he asked, “D’you think dreams can have a meaning?” “Well,” I said, “some dreams certainly have a meaning.” “But what could be the meaning of a dream like that?” he asked sharply, with a nervous twitch of the face. I said, “Did you notice anything peculiar about this young major? What did he look like?” “He looked like me, when I was a young major.” “Well, then,” I said, “it looks as if you had forgotten or lost something which you were still able to do when you were a young major. Evidently the dream was calling your attention to it.” He thought for a while, and then he burst out, “That’s it, you’ve got it! When I was a young major I was interested in art. But later this interest got swamped by routine.” Thereupon he relapsed into silence, and not a word more was spoken. After dinner I had an opportunity of speaking with the man whom I took to be his adjutant. He confirmed my surmise about the old gentleman’s rank, and told me that I had obviously touched on a sore spot, because the general was known and feared as a crusty old disciplinarian who meddled with the most trifling matters that were no concern of his.

188] For the general attitude of this man it would certainly have been better if he had kept and cultivated a few outside interests instead of letting himself be drowned in mere routine, which was neither in his own interest nor in that of his work.

189] Had the analysis been carried further, I could have shown him that he would be well advised to accept the standpoint of the dream. He would thus have been able to realize his one-sidedness, and correct it. Dreams are of inestimable value in this respect, provided that you keep away from all theoretical assumptions, as they only arouse unnecessary resistances in the patient. One such theoretical assumption is the idea that dreams are always repressed wish-fulfilments, generally of an erotic nature. It is far better, in actual practice, not to make any assumptions at all, not even that dreams must of necessity be compensatory. The fewer assumptions you have, and the more you can allow yourself to be acted upon by the dream and by what the dreamer has to say about it, the more easily you will arrive at the meaning of the dream. There are sexual dreams, just as there are hunger dreams, fever dreams, anxiety dreams, and others of a somatogenic nature. Dreams of this kind are clear enough, and no elaborate work of interpretation is needed to uncover their instinctual basis. So, guided by long experience, I now proceed on the principle that a dream expresses exactly what it means, and that any interpretation which yields a meaning not expressed in the manifest dream-image is therefore wrong. Dreams are

neither deliberate nor arbitrary fabrications; they are natural phenomena which are nothing other than what they pretend to be. They do not deceive, they do not lie, they do not distort or disguise, but naïvely announce what they are and what they mean. They are irritating and misleading only because we do not understand them. They employ no artifices in order to conceal something, but inform us of their content as plainly as possible in their own way. We can also see what it is that makes them so strange and so difficult: for we have learned from experience that they are invariably seeking to express something that the ego does not know and does not understand. Their inability to express themselves more plainly corresponds to the inability, or unwillingness, of the conscious mind to understand the point in question. To take an example: if only our friend the general had taken the necessary time off from his undoubtedly exhausting duties to consider what it was that prompted him to go poking about in his soldiers' knapsacks—an occupation he would have done better to leave to his subordinates—he would have discovered the reason for his irritability and bad moods, and would thus have spared himself the annoying blow which my innocent interpretation dealt him. He could, with a little reflection, have understood the dream himself, for it was as simple and clear as could be wished. But it had the nasty quality of touching him on his blind spot; indeed it is this blind spot that spoke in the dream.

190] There is no denying that dreams often confront the psychologist with difficult problems, so difficult, indeed, that many psychologists prefer to ignore them, and to echo the lay prejudice that dreams are nonsense. But, just as a mineralogist would be ill advised to throw away his specimens because they are only worthless pebbles, so the psychologist and doctor denies himself the profoundest insight into the psychic life of his clients if he is prejudiced and ignorant enough to gloss over the utterances of the unconscious, not to speak of solving the scientific task which dreams impose on the investigator.

191] Since dreams are not pathological but quite normal phenomena, dream psychology is not the prerogative of the doctor but of psychologists in general. In practice, however, it is chiefly the doctor who will have to concern himself with dreams, because their interpretation offers the key to the unconscious. This key is needed above all by the doctor who has to treat neurotic and psychotic disorders. Sick people have a naturally stronger incentive to probe into their unconscious than have healthy people, and they therefore enjoy an advantage which the others do not share. It is very rare for the normal adult to find that an important part of his education has been neglected, and then to spend a large amount of time and money on getting a deeper insight into himself and a broader equability. As a matter of fact, so very much is lacking to the educated man of today that it is sometimes hard to tell him apart from a neurotic. Besides cases of the latter sort, who obviously need

medical attention, there are numerous others who could be helped just as much by a practical psychologist.

- 192] Treatment by dream-analysis is an eminently educational activity, whose basic principles and conclusions would be of the greatest assistance in curing the evils of our time. What a blessing it would be, for instance, if even a small percentage of the population could be acquainted with the fact that it simply does not pay to accuse others of the faults from which one suffers most of all oneself!
- 193] The material you have to work with in the analysis of the unconscious consists not only of dreams. There are products of the unconscious which are known as fantasies. These fantasies are either a sort of day-dreaming, or else they are rather like visions and inspirations. You can analyse them in the same way as dreams.
- 194] There are two principal methods of interpretation which can be applied according to the nature of the case. The first is the so-called reductive method. Its chief aim is to find out the instinctive impulses underlying the dream. Take as an example the dreams of the elderly lady I mentioned a short while back. In her case, certainly, it was most important that she should see and understand the instinctive facts. But in the case of the old general it would have been somewhat artificial to speak of repressed biological instincts, and it is highly unlikely that he was repressing his aesthetic interests. Rather, he drifted away from them through force of habit. In his case, dream-interpretation would have a *constructive* purpose, as we should try to add something to his conscious attitude, rounding it out as it were. His sinking into a routine corresponds to a certain indolence and inertia which is characteristic of the Old Adam in us. The dream was trying to scare him out of it. But in the case of the elderly lady the understanding of the erotic factor would enable her consciously to recognize her primitive female nature, which for her is more important than the illusion of improbable innocence and strait-laced respectability.
- 195] Thus we apply a largely reductive point of view in all cases where it is a question of illusions, fictions, and exaggerated attitudes. On the other hand, a constructive point of view must be considered for all cases where the conscious attitude is more or less normal, but capable of greater development and refinement, or where unconscious tendencies, also capable of development, are being misunderstood and kept under by the conscious mind. The reductive standpoint is the distinguishing feature of Freudian interpretation. It always leads back to the primitive and elementary. The constructive standpoint, on the other hand, tries to synthesize, to build up, to direct one's gaze forwards. It is less pessimistic than the other, which is always on the look-out for the morbid and thus tries to break down something complicated into something simple. It may occasionally be necessary for the treatment to destroy pathological structures; but treatment consists just as often, or even oftener, in strengthening and protecting what is healthy and worth preserving,

so as to deprive the morbidities of any foothold. You can, if you like, regard not only every dream, but every symptom of illness, every characteristic, every manifestation of life from the reductive point of view, and thus arrive at the possibility of a negative judgment. If you go far enough back in your investigations, then we are all descended from thieves and murderers, and it is easy to show how all humility is rooted in spiritual pride, and every virtue in its corresponding vice. Which point of view he shall decide to adopt in any given case must be left to the insight and experience of the analyst. He will avail himself now of the one and now of the other in accordance with his knowledge of the character and conscious situation of his patient.

- 196] A few words on the symbolism of dreams and fantasies may not be out of place in this connection. Symbolism has today assumed the proportions of a science and can no longer make do with more or less fanciful sexual interpretations. Elsewhere I have attempted to put symbolism on the only possible scientific foundation, namely that of comparative research.¹³ This method seems to have yielded extremely significant results.
- 197] Dream-symbolism has first of all a personal character which can be elucidated by the dreamer's associations. An interpretation that goes over the dreamer's head is not to be recommended, though it is perfectly possible in the case of certain symbolisms.¹⁴ In order to establish the exact meaning which a dream has for the dreamer personally, the dreamer's collaboration is absolutely essential. Dream-images are many-faceted and one can never be sure that they have the same meaning in another dream or in another dreamer. A relative constancy of meaning is exhibited only by the so-called *archetypal* images.¹⁵
- 198] For the practical work of dream-analysis one needs a special knack and intuitive understanding on the one hand, and a considerable knowledge of the history of symbols on the other. As in all practical work with psychology, mere intellect is not enough; one also needs feeling, because otherwise the exceedingly important feeling-values of the dream are neglected. Without these, dream-analysis is impossible. As the dream is dreamed by the whole man, it follows that anyone who tries to interpret the dream must be engaged as a whole man too. "Ars totum requirit hominem," says an old alchemist. Understanding and knowledge there must be, but they should not set themselves up above the heart, which in its turn must not give way to sentiment. All in all, dream-interpretation is an art, like diagnosis, surgery, and therapeutics in general—difficult, but capable of being learned by those whose gift and destiny it is.

LECTURE THREE

199] Through the analysis and interpretation of dreams we try to understand the tendencies of the unconscious. When I say “tendencies of the unconscious” it sounds very like a personification, as though the unconscious were a conscious being with a will of its own. But from the scientific standpoint it is simply a *quality* of certain psychic phenomena. One cannot even say that there is a definite class of psychic phenomena which regularly and under all circumstances have the quality of being unconscious. Anything may be, or become, unconscious. Anything you forget, or anything from which you divert your attention until it is forgotten, falls into the unconscious. In brief, anything whose energy-tension drops below a certain level becomes subliminal. If, to your lost memories, you add the many subliminal perceptions, thoughts, and feelings, you will get some idea of what constitutes as it were the upper layers of the unconscious.

199^{a]} Such is the material you have to deal with in the first part of a practical analysis. Some of these unconscious contents have the special quality of being actively repressed by the conscious mind. Through the more or less deliberate withdrawal of attention from certain conscious contents, and through active resistance to them, they are eventually expelled from consciousness. A continual mood of resistance keeps these contents artificially below the threshold of potential consciousness. This is a regular occurrence in hysteria. It is the beginning of the personality split which is one of the most conspicuous features of this illness. Despite the fact that repression also occurs in relatively normal individuals, the total loss of repressed memories is a pathological symptom. Repression, however, should be clearly distinguished from suppression. Whenever you want to switch your attention from something in order to concentrate it on something else, you have to suppress the previously existing contents of consciousness, because, if you cannot disregard them, you will not be able to change your object of interest. Normally you can go back to the suppressed contents any time you like; they are always recoverable. But if they resist recovery, it may be a case of repression. In that case there must be some interest somewhere which wants to forget. Suppression does not cause forgetting, but repression definitely does. There is of course a perfectly normal process of forgetting which has nothing to do with repression. Repression is an artificial loss of memory, a self-suggested amnesia. It is not, in my experience, justifiable to assume that the unconscious consists wholly or for the greater part of repressed material. Repression is an exceptional and abnormal process, and the most striking evidence of this is the loss of feeling-toned contents, which one might think

would persist in consciousness and remain easily recoverable. It can have effects very similar to those produced by concussion and by other brain injuries (e.g., by poisoning), for these cause an equally striking loss of memory. But whereas in the latter case absolutely all memories of a certain period are affected, repression causes what is called a *systematic amnesia*, where only specific memories or groups of ideas are withdrawn from recollection. In such cases a certain attitude or tendency can be detected on the part of the conscious mind, a deliberate intention to avoid even the bare possibility of recollection, for the very good reason that it would be painful or disagreeable. The idea of repression is quite in place here. This phenomenon can be observed most easily in the association experiment, where certain stimulus words hit the feeling-toned complexes. When they are touched, lapses or falsifications of memory (amnesia or paramnesia) are very common occurrences. Generally the complexes have to do with unpleasant things which one would rather forget and of which one has no wish to be reminded. The complexes themselves are the result, as a rule, of painful experiences and impressions.

200] Unfortunately, this rule is subject to certain limitations. It sometimes happens that even important contents disappear from consciousness without the slightest trace of repression. They vanish automatically, to the great distress of the person concerned and not at all on account of some conscious interest which has engineered the loss and rejoices over it. I am not speaking here of normal forgetting, which is only a natural lowering of energy-tension; I am thinking rather of cases where a motive, a word, image, or person, vanishes without trace from the memory, to reappear later at some important juncture. These are cases of what is called cryptomnesia. (One such case, which concerned Nietzsche, is described in my "Psychology and Pathology of So-called Occult Phenomena," 1902.¹) I remember, for instance, meeting a writer who later described our conversation in great detail in his autobiography. But the *pièce de résistance* was missing, namely a little lecture I read him on the origin of certain psychic disturbances. This memory was not in his repertoire. It reappeared, however, most significantly in another of his books devoted to this subject. For, in the last resort, we are conditioned not only by the past, but by the future, which is sketched out in us long beforehand and gradually evolves out of us. This is especially the case with a creative person who does not at first see the wealth of possibilities within him, although they are all lying there ready. So it may easily happen that one of these still unconscious aptitudes is called awake by a "chance" remark or by some other incident, without the conscious mind knowing exactly what has awakened, or even that anything has awakened at all. Only after a comparatively long incubation period does the result hatch out. The initial cause or stimulus often remains permanently submerged. A content that is not yet conscious behaves exactly like an ordinary complex. It irradiates the conscious mind and causes the conscious

contents associated with it either to become supercharged, so that they are retained in consciousness with remarkable tenacity, or else to do just the opposite, becoming liable to disappear suddenly, not through repression from above, but through attraction from below. One may even be led to the discovery of certain hitherto unconscious contents through the existence of what one might call “lacunae,” or eclipses in consciousness. It is therefore well worth while to look a bit more closely when you have the vague feeling of having overlooked or forgotten something. Naturally, if you assume that the unconscious consists mainly of repressions, you cannot imagine any creative activity in the unconscious, and you logically arrive at the conclusion that eclipses are nothing but secondary effects following a repression. You then find yourself on a steep slope. The explanation through repression is carried to inordinate lengths, and the creative element is completely disregarded. Causalism is exaggerated out of all proportion and the creation of culture is interpreted as a bogus substitute activity. This view is not only splenetic, it also devalues whatever good there is in culture. It then looks as if culture were only a long-drawn sigh over the loss of paradise, with all its infantilism, barbarity, and primitiveness. In truly neurotic manner it is suggested that a wicked patriarch in the dim past forbade infantile delights on pain of castration. Thus, somewhat too drastically and with too little psychological tact, the castration myth becomes the aetiological culture-myth. This leads on to a specious explanation of our present cultural “discontent,”² and one is perpetually smelling out regrets for some lost paradise which one ought to have had. That the sojourn in this barbarous little kindergarten is considerably more discontenting and uncomfortable than any culture up to 1933 is a fact which the weary European has had ample opportunity to verify for himself during the last few years. I suspect that the “discontent” has very personal motivations. Also, one can easily throw dust into one’s own eyes with theories. The theory of repressed infantile sexuality or of infantile traumata has served innumerable times in practice to divert one’s attention from the actual reasons for the neurosis,³ that is to say, from all the slacknesses, carelessnesses, callousnesses, greedinesses, spitefulnesses, and sundry other selfishnesses for whose explanation no complicated theories of sexual repression are needed. People should know that not only the neurotic, but everybody, naturally prefers (so long as he lacks insight) never to seek the causes of any inconvenience in himself, but to push them as far away from himself as possible in space and time. Otherwise he would run the risk of having to make a change for the better. Compared with this odious risk it seems infinitely more advantageous either to put the blame on to somebody else, or, if the fault lies undeniably with oneself, at least to assume that it somehow arose of its own accord in early infancy. One cannot of course quite remember how, but if one could remember, then the entire neurosis would vanish on the spot. The efforts to remember give the appearance of strenuous activity, and furthermore have the

advantage of being a beautiful red herring. For which reason it may seem eminently desirable, from this point of view also, to continue to hunt the trauma as long as possible.

201] This far from unwelcome argument requires no revision of the existing attitude and no discussion of present-day problems. There can of course be no doubt that many neuroses begin in childhood with traumatic experiences, and that nostalgic yearnings for the irresponsibilities of infancy are a daily temptation to certain patients. But it remains equally true that hysteria, for instance, is only too ready to manufacture traumatic experiences where these are lacking, so that the patient deceives both himself and the doctor. Moreover it still has to be explained why the same experience works traumatically with one child and not with another.

202] Naïveté is out of place in psychotherapy. The doctor, like the educator, must always keep his eyes open to the possibility of being consciously or unconsciously deceived, not merely by his patient, but above all by himself. The tendency to live in illusion and to believe in a fiction of oneself—in the good sense or in the bad—is almost insuperably great. The neurotic is one who falls victim to his own illusions. But anyone who is deceived, himself deceives. Everything can then serve the purposes of concealment and subterfuge. The psychotherapist should realize that so long as he believes in a theory and in a definite method he is likely to be fooled by certain cases, namely by those clever enough to select a safe hiding-place for themselves behind the trappings of the theory, and then to use the method so skilfully as to make the hiding-place undiscoverable.

203] Since there is no nag that cannot be ridden to death, all theories of neurosis and methods of treatment are a dubious affair. So I always find it cheering when businesslike physicians and fashionable consultants aver that they treat patients along the lines of “Adler,” or of “Künkel,” or of “Freud,” or even of “Jung.” There simply is not and cannot be any such treatment, and even if there could be, one would be on the surest road to failure. When I treat Mr. X, I have of necessity to use method X, just as with Mrs. Z I have to use method Z. This means that the method of treatment is determined primarily by the nature of the case. All our psychological experiences, all points of view whatsoever, no matter from what theory they derive, may be of use on the right occasion. A doctrinal system like that of Freud or Adler consists on the one hand of technical rules, and on the other of the pet emotive ideas of its author. Still under the spell of the old pathology, which unconsciously regarded diseases as distinct “*entia*” in the Paracelsian sense,^{3a} each of them thought it possible to describe a neurosis as if it presented a specific and clearly defined clinical picture. In the same way doctors still hoped to capture the essence of the neurosis with doctrinaire classifications and to express it in simple formulae. Such an endeavour was rewarding up to a point, but it only thrust all the unessential

features of the neurosis to the forefront, and thus covered up the one aspect that is essential, namely the fact that this illness is always an intensely individual phenomenon. The real and effective treatment of neurosis is always individual, and for this reason the stubborn application of a particular theory or method must be characterized as basically wrong. If it has become evident anywhere that there are not so much illnesses as ill people, this is manifestly the case in neurosis. Here we meet with the most individual clinical pictures it is possible to imagine, and not only that, but we frequently find in the neuroses contents or components of personality which are far more characteristic of the patient as an individual than the somewhat colourless figure he is all too likely to cut in civilian life. Because the neuroses are so extraordinarily individualistic, their theoretical formulation is an impossibly difficult task, as it can only refer to the collective features, i.e., those common to many individuals. But that is precisely the least important thing about the illness, or rather, it is totally irrelevant. Apart from this difficulty there is something else to be considered, the fact, namely, that nearly every psychological principle, every truth relating to the psyche, must, if it is to be made absolutely true, immediately be reversed. Thus one is neurotic because one has repressions or because one does not have repressions; because one's head is full of infantile sex fantasies or because one has no fantasies; because one is childishly unadapted to one's environment or because one is adapted too exclusively to the environment; because one does or because one does not live by the pleasure principle; because one is too unconscious or because one is too conscious; because one is selfish or because one exists too little as a self; and so on. These antinomies, which can be multiplied at will, show how difficult and thankless is the task of theory-building in psychology.

204] I myself have long discarded any uniform theory of neurosis, except for a few quite general points like dissociation, conflict, complex, regression, *abaissement du niveau mental*, which belong as it were to the stock-in-trade of neurosis. In other words, every neurosis is characterized by dissociation and conflict, contains complexes, and shows traces of regression and *abaissement*. These principles are not, in my experience, reversible. But even in the very common phenomenon of repression the antinomial principle is already at work, since the principle "The chief mechanism of neurosis lies in repression" must be reversed because instead of repression we often find its exact opposite, the *drawing away* of a content, its subtraction or abduction, which corresponds to the "loss of soul" so frequently observed among primitives.⁴ "Loss of soul" is not due to repression but is clearly a species of seizure, and is therefore explained as sorcery. These phenomena, originally belonging to the realm of magic, have not by any means died out in so-called civilized people.

205] A general theory of neurosis is therefore a premature undertaking, because our grasp of the facts is still far from complete. Comparative research into the unconscious has only begun.

206] Prematurely conceived theories are not without their dangers. Thus the theory of repression, whose validity in a definite field of pathology is incontestable—up to the point where it has to be reversed!—has been extended to creative processes, and the creation of culture relegated to second place, as a mere ersatz product. At the same time the wholeness and healthiness of the creative function is seen in the murky light of neurosis, which is of course an undoubted product of repression in many cases. In this way creativity becomes indistinguishable from morbidity, and the creative individual immediately suspects himself of some kind of illness, while the neurotic has lately begun to believe that his neurosis is an art, or at least a source of art. These would-be artists, however, develop one characteristic symptom: they one and all shun psychology like the plague, because they are terrified that this monster will gobble up their so-called artistic ability. As if a whole army of psychologists could do anything against the power of a god! True productivity is a spring that can never be stopped up. Is there any trickery on earth which could have prevented Mozart or Beethoven from creating? Creative power is mightier than its possessor. If it is not so, then it is a feeble thing, and given favourable conditions will nourish an endearing talent, but no more. If, on the other hand, it is a neurosis, it often takes only a word or a look for the illusion to go up in smoke. Then the supposed poet can no longer write, and the painter's ideas become fewer and drearier than ever, and for all this psychology is to blame. I should be delighted if a knowledge of psychology did have this sanative effect and if it put an end to the neuroticism which makes contemporary art such an unenjoyable problem. Disease has never yet fostered creative work; on the contrary, it is the most formidable obstacle to creation. No breaking down of repressions can ever destroy true creativeness, just as no analysis can ever exhaust the unconscious.

207] The unconscious is the ever-creative mother of consciousness. Consciousness grows out of the unconscious in childhood, just as it did in primeval times when man became man. I have often been asked how the conscious arose from the unconscious. The only possible way to answer this is to infer, from present experience, certain events which lie hidden in the abyss of the past, beyond the reach of science. I do not know whether such an inference is permissible, but it may be that even in those remote times consciousness arose in much the same way as it arises today. There are two distinct ways in which consciousness arises. The one is a moment of high emotional tension, comparable to the scene in *Parsifal* where the hero, at the very moment of greatest temptation, suddenly realizes the meaning of Amfortas' wound. The other way is a state of contemplation, in which ideas pass

before the mind like dream-images. Suddenly there is a flash of association between two apparently disconnected and widely separated ideas, and this has the effect of releasing a latent tension. Such a moment often works like a revelation. In every case it seems to be the discharge of energy-tension, whether external or internal, which produces consciousness. Many, though not all, of the earliest memories of infancy still retain traces of these sudden flashes of consciousness. Like the records handed down from the dawn of history, some of them are remnants of real happenings, others are purely mythical; in other words, some were objective in origin, and some subjective. The latter are often extremely symbolical and of great importance for the subsequent psychic life of the individual. Most of the earliest impressions in life are soon forgotten and go to form the infantile layer of what I have called the PERSONAL UNCONSCIOUS. There are definite reasons for this division of the unconscious into two parts. The personal unconscious contains everything forgotten or repressed or otherwise subliminal that has been acquired by the individual consciously or unconsciously. This material has an unmistakably personal stamp. But you can also find other contents which bear hardly any trace of a personal quality, and which appear incredibly strange to the individual. Such contents are frequently found in insanity, where they contribute not a little to the confusion and disorientation of the patient. In the dreams of normal people, too, these strange contents may occasionally appear. When you analyse a neurotic and compare his unconscious material with that of a man suffering from schizophrenia, you are instantly aware of a striking difference. With the neurotic, the material produced is mainly of a personal origin. His thoughts and feelings revolve round his family and his social set, but in a case of insanity the personal sphere is often completely swamped by collective representations. The madman hears the voice of God speaking to him; in his visions he sees cosmic revolutions, and it is just as if a veil has been twitched away from a world of ideas and emotions hitherto concealed. He suddenly begins talking of spirits, demons, witchcraft, secret magical persecutions, and so forth. It is not difficult to guess what this world is: it is the world of the primitive, which remains profoundly unconscious so long as everything is going well, but rises to the surface when some fatality befalls the conscious mind. This impersonal layer of the psyche I have termed the COLLECTIVE UNCONSCIOUS —“collective” because it is not an individual acquisition but is rather the functioning of the inherited brain structure, which in its broad outlines is the same in all human beings, and in certain respects the same even in mammals. The inherited brain is the product of our ancestral life. It consists of the structural deposits or equivalents of psychic activities which were repeated innumerable times in the life of our ancestors. Conversely, it is at the same time the ever-existing a priori type and

author of the corresponding activity. Far be it from me to decide which came first, the hen or the egg.

208] Our individual consciousness is a superstructure based on the collective unconscious, of whose existence it is normally quite unaware. The collective unconscious influences our dreams only occasionally, and whenever this happens, it produces strange and marvellous dreams remarkable for their beauty, or their demoniacal horror, or for their enigmatic wisdom—"big dreams," as certain primitives call them. People often hide such dreams as though they were precious secrets, and they are quite right to think them so. Dreams of this kind are enormously important for the individual's psychic balance. Often they go far beyond the limits of his mental horizon and stand out for years like spiritual landmarks, even though they may never be quite understood. It is a hopeless undertaking to interpret such dreams reductively, as their real value and meaning lie in themselves. They are spiritual experiences that defy any attempt at rationalization. In order to illustrate what I mean, I should like to tell you the dream of a young theological student.^{4a} I do not know the dreamer myself, so my personal influence is ruled out. He dreamed *he was standing in the presence of a sublime hieratic figure called the "white magician," who was nevertheless clad in a long black robe. This magician had just ended a lengthy discourse with the words "And for that we require the help of the black magician." Then the door suddenly opened and another old man came in, the "black magician," who however was dressed in a white robe. He too looked noble and sublime. The black magician evidently wanted to speak with the white, but hesitated to do so in the presence of the dreamer. At that the white magician said, pointing to the dreamer, "Speak, he is an innocent." So the black magician began to relate a strange story of how he had found the lost keys of paradise and did not know how to use them. He had, he said, come to the white magician for an explanation of the secret of the keys. He told him that the king of the country in which he lived was looking for a suitable monument for himself. His subjects had chanced to dig up an old sarcophagus containing the mortal remains of a virgin. The king opened the sarcophagus, threw away the bones and had the sarcophagus buried again for later use. But no sooner had the bones seen the light of day, than the being to whom they had once belonged—the virgin—changed into a black horse that galloped off into the desert. The black magician pursued it across the sandy wastes and beyond, and there after many vicissitudes and difficulties he found the lost keys of paradise.* That was the end of his story and also, unfortunately, of the dream.

209] I think a dream like this will help to make clear the difference between an ordinary, personal dream and the "big" dream. Anybody with an open mind can at once feel the significance of the dream and will agree with me that such dreams

come from a “different level” from that of the dreams we dream every night. We touch here upon problems of vast import, and it is tempting to dwell on this subject for a while. Our dream should serve to illustrate the activity of the layers that lie below the personal unconscious. The manifest meaning of the dream takes on a quite special aspect when we consider that the dreamer was a young theologian. It is evident that the relativity of good and evil is being presented to him in a most impressive manner. It would therefore be advisable to probe him on this point, and it would be exceedingly interesting to learn what a theologian has to say about this eminently psychological question. Also the psychologist would be in the highest degree interested to see how a theologian would reconcile himself to the fact that the unconscious, while clearly distinguishing between the opposites, nevertheless recognizes their identity. It is hardly likely that a youthful theologian would consciously have thought of anything so heretical. Who, then, is the thinker of such thoughts? If we further consider that there are not a few dreams in which mythological motifs appear, and that these motifs are absolutely unknown to the dreamer, then the question arises of where such material comes from, since he has never encountered it anywhere in his conscious life, and who or what it is that thinks such thoughts and clothes them in such imagery—thoughts which, moreover, go beyond the dreamer’s own mental horizon.⁵ In many dreams and in certain psychoses we frequently come across archetypal material, i.e., ideas and associations whose exact equivalents can be found in mythology. From these parallels I have drawn the conclusion that there is a layer of the unconscious which functions in exactly the same way as the archaic psyche that produced the myths.

210] Although dreams in which these mythological parallels appear are not uncommon, the emergence of the collective unconscious, as I have called this myth-like layer, is an unusual event which only takes place under special conditions. It appears in the dreams dreamt at important junctures in life. The earliest dreams of childhood, if we can still remember them, often contain the most astonishing mythologems; we also find the primordial images in poetry and in art generally, while religious experience and dogma are a mine of archetypal lore.

211] The collective unconscious is a problem that seldom enters into practical work with children: their problem lies mainly in adapting themselves to their surroundings. Indeed, their connection with the primordial unconsciousness must be severed, as its persistence would present a formidable obstacle to the development of consciousness, which is what they need more than anything else. But if I were discussing the psychology of people beyond middle life, I should have a good deal more to say about the significance of the collective unconscious. You should always bear in mind that our psychology varies not only according to the momentary predominance of certain instinctive impulses and certain complexes, but according

to the individual's life phase. You should be careful, therefore, not to impute an adult's psychology to a child. You cannot treat a child as you would an adult. Above all, the work can never be as systematic as with adults. A real, systematic dream-analysis is hardly possible, because with children the unconscious should not be stressed unnecessarily: one can easily arouse an unwholesome curiosity, or induce an abnormal precociousness and self-consciousness, by going into psychological details which are of interest only to the adult. When you have to handle difficult children, it is better to keep your knowledge of psychology to yourself, as simplicity and common sense are what they need most.⁶ Your analytical knowledge should serve your own attitude as an educator first of all, because it is a well-known fact that children have an almost uncanny instinct for the teacher's personal shortcomings. They know the false from the true far better than one likes to admit. Therefore the teacher should watch his own psychic condition, so that he can spot the source of the trouble when anything goes wrong with the children entrusted to his care. He himself may easily be the unconscious cause of evil. Naturally we must not be too naïve in this matter: there are people, doctors as well as teachers, who secretly believe that a person in authority has the right to behave just as he likes, and that it is up to the child to adapt as best he may, because sooner or later he will have to adapt to real life which will treat him no better. Such people are convinced at heart that the only thing that matters is material success, and that the only real and effective moral restraint is the policeman behind the penal code. Where unconditional adaptation to the powers of this world is accepted as the supreme principle of belief, it would of course be vain to expect psychological insight from a person in authority as a moral obligation. But anyone who professes a democratic view of the world cannot approve of such an authoritarian attitude, believing as he does in a fair distribution of burdens and advantages. It is not true that the educator is always the one who educates, and the child always the one to be educated. The educator, too, is a fallible human being, and the child he educates will reflect his failings. Therefore it is wise to be as clear-sighted as possible about one's subjective views, and particularly about one's faults. As a man is, so will be his ultimate truth, and so also his strongest effect on others.

212] The psychology of children's neuroses can only be described very inadequately in general systematic terms, for, with few exceptions, the unique or individual features are overwhelmingly preponderant, as is usually also the case with the neuroses of adults. Here as there diagnoses and classifications have little meaning when weighed against the individual peculiarity of each case. Instead of a general description I should like to give you some examples from case histories, which I owe to the friendly collaboration of my pupil Frances G. Wickes, formerly consulting psychologist at St. Agatha's School, New York City.⁷

213] The first case is that of a boy seven years old. He had been diagnosed as mentally defective. The boy showed lack of coordination in walking, squinted in one eye and had an impediment in his speech. He was given to sudden outbursts of temper, and would keep the house in an uproar with his wild rages, throwing things about and threatening to kill the family. He liked to tease and to show off. At school he bullied the other children; he could not read, or take his place in class with children of the same age. After he had been at school for about six months, the rages increased until there were several each day. He was a first child, had been happy and friendly enough up to the age of five and a half, but between three and four he developed night terrors. He was late in learning to talk. The tongue was found to be tied, and an operation was performed. He could still hardly articulate at five and a half, and it was then discovered that the ligaments had not been properly cut. This was remedied. When he was five, a small brother was born. At first he was delighted, but as the baby grew older he seemed at times to hate him. As soon as his little brother began to walk, which he did unusually early, our patient started his wild tempers. He would show great vindictiveness, alternating with moods of affection and remorse. As these rages seemed to be brought on by almost anything, no matter how trifling, nobody thought of jealousy. As the rages increased, so the night terrors abated. Intelligence tests showed unusual ability in thinking. He was delighted at every success and became friendly when encouraged, but was irritable over failures. The parents were brought to understand that the rages were compensatory power manifestations which he developed on realizing his own impotence, firstly when he saw how his little brother was praised and admired for doing with perfect ease the very thing that was impossible for him, and then in having to compete on such unequal terms with the other children at school. While he had remained the only child, whose parents lavished special care on him because of his handicaps, he was happy; but when he tried to hold his own on such unequal terms he became like a wild animal trying to break the chain. The rages, which the mother said were apt to occur “when some little bit of a thing went wrong,” were often found to be connected with the times when the little brother was made to show off his tricks before visitors.

214] The boy soon developed very good relations with the psychologist, whom he called his “friend.” He began to talk to her without falling into his rages. He would not tell his dreams, but would indulge in bombastic fantasies about how he was going to kill everybody and cut off their heads with a great sword. One day he suddenly interrupted himself and said: “That’s what I’ll do. What do you think of that?” The psychologist laughed and answered, “I think just as you do—it’s all bunk.” Then she gave him a picture of Santa Claus which he had admired, saying, “You and Santa Claus and I know it’s all bunk.” His mother put the picture in the

window for him to see, and the next day he caught sight of it in one of his rages. He calmed down at once and remarked, "Santa Claus, that's all bunk!" and promptly did what he had been told to do. He then began to see his rages as something he enjoyed and used for a definite purpose. He showed remarkable intelligence in discerning his real motives. His parents and teachers co-operated in praising his efforts and not merely his successes. He was made to feel his place as the "eldest son." Special attention was given to speech training. Gradually he learned to control his rages. For a time the old night terrors became more frequent as the rages subsided, but then they too diminished.

215] One cannot expect a disorder that began so early on the basis of organ inferiorities to be cured at once. It will take years to reach a complete adaptation. A strong feeling of inferiority is obviously at the bottom of this neurosis. It is a clear case of Adlerian psychology, where the inferiority gives rise to a power complex. The symptomatology shows how the neurosis attempted to compensate the loss of efficiency.

216] The second case concerns a little girl about nine years old. She had run a subnormal temperature for three months and was unable to attend school. Otherwise she showed no special symptoms, except loss of appetite and increasing listlessness. The doctor could find no reason for this condition. The father and mother were both sure they had the child's full confidence, and that she was not worried or unhappy in any way. The mother finally admitted to the psychologist that she and her husband did not get on together, but said that they never discussed their difficulties in front of the child, who was completely unconscious of them. The mother wanted a divorce, but could not make up her mind to face the upheaval it would involve. So everything remained in mid air, and in the meantime the parents made no effort to solve any of the difficulties causing their unhappiness. Both of them had an unduly possessive attachment to the child, who in turn had a terrific father-complex. She slept in her father's room in a little bed next to his and got into his bed in the mornings. She gave the following dream:

"I went with Daddy to see Granny. Granny was in a big boat. She wanted me to kiss her and wanted to put her arms round me, but I was afraid of her. Daddy said, 'Well then, I'll kiss Granny!' I didn't want him to do it, as I was afraid something might happen to him. Then the boat moved off and I couldn't find anybody and I felt frightened."

217] Several times she had dreams about Granny. Once Granny was all mouth, wide open. Another time she dreamt of "a big snake, which came out from under my bed and played with me." She often spoke of the snake dream, and had one or two others like it. The dream about her Granny she told with reluctance, but then confessed that every time her father went away she was frightened he would never come back. She

had sized up her parents' situation, and told the psychologist that she knew her mother did not like her father, but she did not want to talk about it, "because it would make them feel bad." When her father was away on business trips she was always afraid he would leave them. She had also noticed that her mother was always happier then. The mother realized that she was no help to the child, but on the contrary only made her ill by leaving the situation unsolved. The parents had either to tackle their difficulties together and try to come to a real understanding, or, if this should prove impossible, decide to separate. Eventually, they chose the latter course, and explained the situation to the child. The mother had been convinced that a separation would harm the child, instead of which her health improved as soon as the real situation came out into the open. She was told that she would not be parted from either parent but would have two homes instead; and although a divided home seems a poor arrangement for any child, her relief at no longer being a prey to vague fears and forebodings was so great that she returned to normal health and to real enjoyment of school and play.

217^{a]} A case like this is often a great puzzle to the general practitioner. He looks in vain for an organic cause of the trouble, not knowing that he ought to look elsewhere, for no medical textbook would admit the possibility that psychic difficulties between father and mother could be responsible for the child's subnormal temperature. But to the analyst such causes are by no means unknown or strange. The child is so much a part of the psychological atmosphere of the parents that secret and unsolved problems between them can influence its health profoundly. The *participation mystique*, or primitive identity, causes the child to feel the conflicts of the parents and to suffer from them as if they were its own. It is hardly ever the open conflict or the manifest difficulty that has such a poisonous effect, but almost always parental problems that have been kept hidden or allowed to become unconscious. The author of these neurotic disturbances is, without exception, the unconscious. Things that hang in the air and are vaguely felt by the child, the oppressive atmosphere of apprehension and foreboding, these slowly seep into the child's soul like a poisonous vapour.

218] What this child seemed to feel most was the unconscious of her father. If a man has no real relations with his wife, then obviously he seeks another outlet. And if he is not conscious of what he is seeking, or if he represses fantasies of that kind, his interest will regress on the one side to the memory-image of his mother, and on the other side it invariably fastens on his daughter, if there is one. This is what might be called unconscious incest. You can hardly hold a man responsible for his unconsciousness, but the fact remains that in this matter nature knows neither patience nor pity, and takes her revenge directly or indirectly through illness and unlucky accidents of all kinds. Unfortunately, it is almost a collective ideal for men

and women to be as unconscious as possible in the ticklish affairs of love. But behind the mask of respectability and faithfulness the full fury of neglected love falls upon the children. You cannot blame the ordinary individual, as you cannot expect people to know the attitude they ought to adopt and how they are to solve their love problems within the framework of present-day ideals and conventions. Mostly they know only the negative measures of negligence, procrastination, suppression, and repression. And to know of anything better is admittedly very difficult.

219] The dream about the grandmother shows how the unconscious psychology of the father is penetrating that of the child. It is he who wishes to kiss his mother, and the child feels forced to kiss her in the dream. The grandmother who is “all mouth” suggests swallowing and devouring.⁸ Obviously the child is in danger of being swallowed by her father’s regressive libido. That is why she dreams of the snake; for the snake, since ancient times, has always been the symbol of danger: of being caught in coils, or swallowed, or poisoned.⁹ This case also shows how apt children are to see very much more than their parents suspect. It is of course not possible for parents to have no complexes at all. That would be superhuman. But they should at least come to terms with them consciously; they should make it a duty to work out their inner difficulties for the sake of the children. They should not take the easy road of repressing them in order to avoid painful discussions. The love problem is part of mankind’s heavy toll of suffering, and nobody should be ashamed of having to pay his tribute. It is a thousand times better in every respect for parents frankly to discuss their problems, instead of leaving their complexes to fester in the unconscious.

220] In a case like this, what would be the use of talking to the child about incestuous fantasies and father-fixations? Such a procedure would only make her believe that it was all the fault of her own immoral or foolish nature, and would burden her with a responsibility which is not hers at all, but really belongs to her parents. She suffers not because she has unconscious fantasies but because her father has them. She is a victim of the wrong atmosphere in the home, and her problem disappears as soon as her parents faced up to theirs.

221] The third case concerns a very intelligent girl of thirteen, reported as anti-social, rebellious, and unable to adapt herself to school conditions. At times she was very inattentive and would give peculiar answers for which she could offer no explanation. She was a big, well-developed girl, apparently in the best of health. She was several years younger than her classmates, trying, with her thirteen years, to lead the life of a young girl of sixteen or seventeen, but without the corresponding capabilities. Physically she was over-developed, puberty having begun when she was barely eleven. She was frightened of her sexual excitability and of her desire to

masturbate. Her mother was a woman of brilliant intellect, with an intense will to power, who had early decided that her daughter must be a prodigy. She had forced every intellectual faculty and suppressed all emotional growth. She wanted the child to go to school earlier than anybody else. The father's business took him from home a good deal, and to the girl he seemed more like a shadowy ideal than an actual reality. She suffered from a tremendous pressure of pent-up emotions which fed more upon homosexual fantasies than upon real relationships. She confessed that she sometimes longed to be caressed by a certain teacher, and then suddenly she would fancy that all her clothes had dropped off, so that she lost track of what was being said to her; hence her absurd answers. This is one of her dreams: "*I saw my mother slipping down the bath and I knew she was drowning, but I could not move. Then I grew terribly frightened and started to weep because I had let her drown. I woke up crying.*" This dream helped her to bring to the surface the hidden resistances to the unnatural life she was forced to lead. She acknowledged her desire for normal companionship. Little could be done at home, but a change of surroundings, the understanding of her problem, and the frank discussion brought a considerable improvement.

222] This case is simple, but very typical. The role played by the parents is again most conspicuous. It was one of those typical marriages where the father is completely wrapped up in his business, and the mother tries to realize her social ambitions through the child. The child had to be a success in order to satisfy her mother's desires and expectations and to flatter her vanity. A mother like this does not as a rule see the real character of her child at all, or her individual ways and needs. She projects herself into the child and rules her with a ruthless will to power. Such a marriage is all too likely to produce just that psychological situation and to intensify it still further. There seems to have been a considerable distance between husband and wife, as so masculine a woman can hardly have had any real understanding of a man's feelings: the only thing she knows how to get out of him is his money. He pays her in order to keep her in a fairly tolerable mood. All her love turns into ambition and will to power (if indeed she has not been doing this since long before her marriage, unconsciously following the example of her own mother). The children of such mothers are practically nothing more than dolls, to be dressed up and adorned at pleasure. They are nothing but mute figures on the chessboard of their parents' egoism, and the maddening thing is that all this is done under the cloak of selfless devotion to the dear child, whose happiness is the sole aim of the mother's life. But in actual fact the child is not given a grain of real love. That is why she suffers from premature sexual symptoms, like so many other neglected and ill-treated children, while at the same time she is deluged with so-called maternal love. The homosexual fantasies clearly show that her need for real love is not

satisfied; consequently she craves love from her teachers, but of the wrong sort. If tender feelings are thrown out at the door, then sex in violent form comes in through the window, for besides love and tenderness a child needs understanding. The right thing in this case would naturally be to treat the mother, which might do something to improve her marriage and deflect her passion from the child, at the same time giving the latter access to her mother's heart. Failing that, one can only try to check the mother's injurious influence by stiffening the child's resistance to her, so that she will at least be able to criticize her mother's faults with fairness and become conscious of her own individual needs. Nothing is more stunting than the efforts of a mother to embody herself in her child, without ever considering that a child is not a mere appendage, but a new and individual creature, often furnished with a character which is not in the least like that of the parents and sometimes seems to be quite frighteningly alien. The reason for this is that children are only nominally descended from their parents, but are actually born from the ancestral stock. Occasionally you have to go back several hundred years to see the family likeness.

223] The child's dream is quite intelligible: it obviously means the death of the mother.¹⁰ Such is the answer of the child's unconscious to the mother's blind ambition. Had she not tried to "kill" her daughter's individuality the unconscious would never have reacted in that way. Certainly you should never start generalizing from the results of such a dream. Death-dreams about the parents are not uncommon, and you might be led to suppose that they are always based on the kind of conditions I have just described. But you should remember that a dream-image does not always have the same meaning in all circumstances. You can never be certain of a dream's meaning unless you are sufficiently acquainted with the conscious situation of the dreamer.

224] The last case I shall mention concerns an eight-year-old girl, Margaret, who suffered from a complaint that does not seem to be causally connected with the parents. It is a complicated case which cannot be dealt with fully in a lecture. I have therefore selected only one important phase in its development. The child had been at school for a year without being able to learn anything, except a little reading. She moved clumsily, went up and down stairs like a child just beginning to walk, had little control of her limbs, and spoke in a whining voice. In conversation she would show intense eagerness at first, then suddenly bury her face in her hands and refuse to say any more. As soon as she started to speak she would burst into a weird gibberish made up of disconnected words. When she tried to write she drew single letters, and then covered the whole paper with scribbles which she called "funnies." Intelligence tests could not be given in the normal way, but in several thinking and feeling tests she got the results of an eleven-year-old, in others barely those of a child of four. She had never been normal. When she was ten days old, blood clots

resulting from the difficult birth had to be removed from the cranial cavity. She was watched over day and night and looked after with the greatest care. It soon became apparent that she used her physical disabilities to tyrannize her parents, meanwhile resenting any attempt to help her. The parents tried to compensate her defects by shielding her from reality and by providing her with moral crutches which kept her from struggling to overcome her difficulties and frustrations through an effort of will.

225] The first psychological approach was through the world of imagination. As the child was fairly imaginative, she began to learn to read for the sake of stories, and, once started, she progressed with astonishing rapidity. Too much concentration on one thing made her irritable and excited, but nevertheless there was a steady gain. One day Margaret announced, "I have a twin sister. She is called Anna. She is just like me except that she always wears lovely pink clothes and has glasses. [Glasses meant her weak eyes, which kept her from poring over the books she now loved.] If Anna were here I should work better." The psychologist suggested that Anna should be asked to come in. Margaret went out into the hall and came back with Anna. Then she tried to write, so as to show Anna. After that, Anna was always present. First Margaret would write, then Anna. One day everything went wrong, and finally she burst out, "I shall never learn to write and it's all Mother's fault! I am left-handed, and she never told my first teacher. I had to try to write with my right hand, and now I shall grow up and never be able to write because of Mother." The psychologist told her of another child who was also left-handed and whose mother had made the same mistake. Margaret inquired eagerly, "So he can't write at all?" "Oh, no," said the psychologist, "he writes stories and all sorts of things, only it was harder for him, that's all. He generally writes with his left hand now. You can write with your left hand if you want to." "But I like my right hand best." "Oho, then it doesn't seem to be all your mother's fault. I wonder whose fault it is?" Margaret only said, "I don't know." Thereupon it was suggested that she might ask Anna. So she went out and came back after a while and said, "Anna says it's my fault and I had better do some work." Before this she had always refused to discuss her responsibility, but from now on she would go out of the room, talk it over with Anna, and bring back the result. Sometimes she would come back with all the signs of rebellion, but she always told the truth. Once, after railing against Anna, she said, "But Anna insists, 'Margaret, it's your own fault. You've got to try.'" "From this she went on to a realization of her own projections. One day she got into a fearful temper with her mother. She burst into the room, shouting, "Mother is horrid, horrid, horrid!" "Who is horrid?" she was asked." Mother," she answered. "You might ask Anna," said the psychologist. There was a long pause, then she said, "Pooh! I guess

I know as much as Anna. I'm horrid. I'll go and tell Mother." This she did and then returned quietly to her work.

226] As a result of the serious injury at birth the child had not been able to develop properly. She naturally deserved, and received, a good deal of attention from her parents; but it is almost impossible to draw the line and to know exactly how far one should go in considering a child's incapacities. Somewhere, certainly, the optimum is reached, and if you go beyond that you start spoiling the child. As the first-mentioned case shows, children do feel their inferiority in certain ways, and they begin to compensate by assuming a false superiority. This is only another inferiority, but a moral one; no genuine satisfaction results, and so a vicious circle is begun. The more a real inferiority is compensated by a false superiority, the less the initial inferiority is remedied, and the more it is intensified by the feeling of moral inferiority. This necessarily leads to more false superiority, and so on at an ever increasing rate. Obviously, Margaret needed a great deal of attention and was therefore involuntarily spoiled, so that she learnt to exploit the legitimate devotion of her parents. As a result, she got stuck in her incapacity and defeated her own efforts to extricate herself, remaining more incapable and more infantile than her actual handicaps warranted.

227] Such a condition is most favourable to the growth of a second personality. The fact that her conscious mind fails to progress does not mean in the least that her unconscious personality will also remain at a standstill. This part of herself will advance as time goes on, and the more the conscious part hangs back, the greater will be the dissociation of personality. Then one day the more developed personality will appear on the scene and challenge the regressive ego. This was the case with Margaret: she saw herself confronted by "Anna," her superior twin sister, who for a while represented her moral reason. Later the two merged into one, and this signified a tremendous advance. In 1902, I published a study of very much the same psychological structure. It was about a young girl of sixteen with a quite extraordinary dissociation of personality. You will find it in my paper on "The Psychology and Pathology of So-called Occult Phenomena."¹¹ The educational use which the psychologist made of the second personality brought excellent results, and entirely agreed with the teleological significance of the figure of Anna. The psychic double is a commoner phenomenon than one would expect, although it seldom reaches a degree of intensity that would entitle one to speak of a "double personality."

* * *

228] About education in general and school education in particular the doctor has little to say from the standpoint of his science, as that is hardly his business. But on the

education of difficult or otherwise exceptional children he has an important word to add. He knows only too well from his practical experience what a vital role parental influences and the effects of schooling play even in the life of the adult. He is therefore inclined, when dealing with children's neuroses, to seek the root cause less in the child itself than in its adult surroundings, and more particularly in the parents. Parents have the strongest effect upon the child not only through its inherited constitution, but also through the tremendous psychic influence they themselves exert. That being so, the uneducatedness and unconsciousness of the adult works far more powerfully than any amount of good advice, commands, punishments, and good intentions. But when, as is unfortunately all too often the case, parents and teachers expect the child to make a better job of what they themselves do badly, the effect is positively devastating. Again and again we see parents thrusting their unfulfilled illusions and ambitions on to the child, and forcing it into a role for which it is in no circumstances fitted. I remember being consulted about a badly behaved little boy. From the parents' account I learnt that, at the age of seven, he could neither read nor write, that he would not learn any of his lessons properly, resisting, with unreasoning defiance, every attempt to educate him, and that for two years he had been developing rages in which he smashed everything within reach. He was intelligent enough, so the parents thought, but totally lacking in goodwill. Instead of working he lazed about or played with his decrepit old Teddy bear, which for years had been his only toy. He had been given plenty of other toys, but he viciously destroyed them. They had even engaged a good governess for him, but she could do nothing with him either. He was, after a couple of girls, the first and only son, on whom, so it seemed to me, the mother doted especially. As soon as I saw the child the riddle was solved: the boy was pretty much of an imbecile already, and the mother, who could not endure having a backward son, had so egged on and tormented this essentially harmless and good-natured zany with her ambitions that he went completely berserk out of sheer desperation. When I spoke to the mother after the examination she was outraged by my diagnosis and insisted that I must have made a mistake.

229] The educator should know above all else that talk and officious discipline lead nowhere, that what counts is example. If he unconsciously permits all kinds of viciousness, lies, and bad manners in himself, these will have an incomparably more powerful effect than the best of intentions, which are so easily come by. The doctor therefore believes that the best way to educate others is for the educator himself to be educated, and that he should first try out on himself the psychological profundities he has learnt from text-books, in order to test their efficacy. So long as these efforts are prosecuted with a certain amount of intelligence and patience, he will probably not make such a bad teacher.

V

THE GIFTED CHILD

THE GIFTED CHILD¹

230] When I visited the United States for the first time, I was much astonished to see that there were no barriers at the railway crossings and no protective hedges alongside the railway track. In the remoter districts the line was actually used as a foot-path. When I voiced my astonishment about this, I was informed, “Only an idiot could fail to see that trains pass along the line at forty to a hundred miles an hour!” Another thing that struck me was that nothing is *verboden*; instead, one is merely “not allowed” to do something, or one is politely requested: “Please don’t _____.”

231] These impressions, and others like them, reduced themselves to the discovery that in America civic life appeals to the intelligence and expects an intelligent response, whereas in Europe it plans for stupidity. America fosters and looks forward to intelligence; Europe looks back to see whether the dumb ones are also coming along. What is worse, Europe takes evil intentions for granted and is forever crying that bossy and officious “*Verboten!*” into our ears, whereas America addresses herself to people’s common sense and goodwill.

232] Involuntarily I found my thoughts drifting back to my school-days, and there I saw the European prejudice embodied in certain of my teachers. I was not, as a twelve-year-old schoolboy, by any means drowsy or stupid, but often I felt uncommonly bored when the teacher had to busy himself with the slowcoaches. I had the good fortune to possess a genial Latin master who, during the exercises, used to send me to fetch books from the university library, and in these I browsed with delight as I dawdled back by the longest possible route. Boredom, however, was by no means the worst of my experiences. Once, among the numerous and not exactly stimulating themes for an essay, we were given something really interesting. I set to work very seriously and polished my sentences with the greatest care. In happy anticipation of having written the best, or at least one of the better essays, I handed mine in to the teacher. When giving them back he always used to discuss the best essay first, and then the others in order of merit. All the others came before mine, and when the last, feeblest effort was about to be discussed, the teacher inflated himself in a manner that boded disaster, and pronounced the following words: “Jung’s essay is by far the best, but he has composed it frivolously and dashed it off without taking any trouble. Therefore it merits no attention whatever.” “That is not true,” I cried, “I’ve never put so much work into any essay as I did into this.” “That’s a lie!” he shouted. “Look at Smith Minor”—the boy who had

produced the worst essay—“*he* took trouble over his. He will get on in life, but you won’t, no, not you—for in life you can’t get away with cleverness and humbug.” I was silent. From that moment I never did a stroke of work during German lessons.

233] This mishap lies more than half a century behind me, and I have no doubt that there have been many changes and improvements in the school since then. But, at the time, it obsessed my thoughts and left me with a feeling of bitterness, though this naturally gave place to better understanding as my experience of life increased. I came to realize that my teacher’s attitude was after all based on the noble precept of helping the weak and eradicating the bad. But, as so often happens with such precepts, they are apt to be elevated to soulless principles which do not bear thinking about further, so that a lamentable caricature of goodness results: one helps the weak and fights against the bad, but at the same time one runs the risk of putting the gifted child in a back place, as though being ahead of one’s fellows were something scandalous and improper. The average person distrusts and readily suspects anything that his intelligence cannot grasp. *Il est trop intelligent*—reason enough for the blackest suspicion! In one of his novels Paul Bourget describes an exquisite scene in the antechamber of some Minister, which serves as the perfect paradigm. A middle-class couple offer this criticism of a celebrated scholar, with whom of course they are not acquainted: “Il doit être de la police secrète, il a l’air si méchant.”

234] I trust you will forgive me for having dwelt so long on autobiographical details. Nevertheless this *Wahrheit* without the *Dichtung* is not just an isolated instance; it is something that happens all too often. The gifted schoolchild faces us with an important task which we cannot ignore, despite that worthy maxim about helping the less gifted. In a country as small as Switzerland we cannot afford, however charitable our aspirations may be, to overlook these much-needed gifted children. Even today we seem to proceed somewhat diffidently in this matter. Not long ago I heard of the following case: An intelligent little girl in one of the lower forms at a primary school suddenly became a bad pupil, much to the astonishment of her parents. The things the child said out of school sounded so comical that her parents got the impression that the children were treated like idiots and were being stultified artificially. So the mother went to see the Principal about it and discovered that the teacher had been trained to cope with defectives and had formerly looked after backward children. Obviously she did not know the first thing about normal ones. Luckily the damage was caught in time, so that the child could be passed on to a normal teacher under whom she soon picked up again.

235] The problem of the gifted child is not at all simple, because he is not distinguished merely by the fact of being a good pupil. Occasionally he is the exact opposite. He may even be notoriously absent-minded, have his head full of other things, be

indolent, slovenly, inattentive, badly behaved, self-willed, or evoke the impression of being half asleep. From external observation alone it is sometimes difficult to distinguish the gifted child from a mental defective.

236] Nor should we forget that gifted children are not always precocious, but may on the contrary develop slowly, so that the gift remains latent for a long time. The giftedness can then be spotted only with difficulty. On the other hand too much goodwill and optimism on the part of the teacher can imagine talents that later turn out to be blanks, as in the biography which says: "No signs of genius were observable up to his fortieth year—nor indeed afterwards."

237] Sometimes the only thing that helps in diagnosing a gift is careful observation of the child's individuality both in school and at home, which alone enables us to see what is primary disposition and what is secondary reaction. In the gifted child inattentiveness, absent-mindedness, and day-dreaming may prove to be a secondary defence against outside influences, in order that the interior fantasy processes may be pursued undisturbed. Admittedly the mere existence of lively fantasies or peculiar interests is no proof of special gifts, as the same predominance of aimless fantasies and abnormal interests may also be found in the previous history of neurotics and psychotics. What does reveal the gift, however, is the *nature* of these fantasies. For this one must be able to distinguish an intelligent fantasy from a stupid one. A good criterion of judgment is the originality, consistency, intensity, and subtlety of the fantasy structure, as well as the latent possibility of its realization. One must also consider how far the fantasy extends into the child's actual life, for instance in the form of hobbies systematically pursued and other interests. Another important indication is the degree and quality of his interest in general. One sometimes makes surprising discoveries where problem children are concerned, such as a voracious and apparently indiscriminate reading of books, done mostly in the forbidden hours after bedtime, or else some unusual practical accomplishment. All these signs can only be understood by one who takes the trouble to inquire into the reasons for the child's problems, and who is not content merely to pick on the bad qualities. A certain knowledge of psychology—by which I mean common sense and experience—is therefore a desirable requisite in a teacher.

238] The psychic disposition of the gifted child always moves in violent contrasts. That is to say, it is extremely rare for the gift to affect all regions of the psyche uniformly. The general rule is that one or the other region will be so little developed as to entitle us to speak of a defect. Above all the degree of maturity differs enormously. In the region of the gift abnormal precocity may prevail, while outside that region the mental attainment may be below normal for a child of that age. Occasionally this gives rise to a misleading picture: one thinks one is dealing with a rather undeveloped and mentally backward child and, in consequence, fails to credit him

with any ability above the normal. Or it may be that a precocious intellect is not accompanied by a corresponding development of verbal facility, so that the child is driven to express himself in a seemingly confused or unintelligible way. In such cases only a careful inquiry into the why and wherefore, and a conscientious deliberation of the answers, can save the teacher from false judgments. But there are also cases where the gift applies to some aptitude not affected by school-work at all. This is particularly true of certain practical accomplishments. I myself remember boys who distinguished themselves at school by their remarkable stupidity, but who were highly efficient at the peasant trades of their parents.

239] While I am on this subject I must not omit to point out that very erroneous views used to be held at one time concerning the gift for mathematics. It was believed that the capacity for logical and abstract thought was, so to speak, incarnate in mathematics and that this was therefore the best discipline if one wanted to think logically. But the mathematical gift, like the musical gift to which it is biologically related, is identical neither with logic nor with intellect, although it makes use of them just as all philosophy and science do. One can be musical without possessing a scrap of intellect, and in the same way astounding feats of calculation can be performed by imbeciles. Mathematical sense can be inculcated as little as can musical sense, for it is a specific gift.

240] The gifted child is faced with complications not only in the intellectual but in the moral sphere, that is, in the province of feeling. The prevarication, lying, and other moral laxities so common in grown-ups can easily become a distressing problem for the morally gifted child. It is just as easy for an adult to disregard moral criticism that springs from feeling, as it is to overlook or underestimate intellectual sensitivity and precocity. The gifts of the heart are not quite so obvious or so impressive as intellectual and technical endowments, and, just as the latter demand special understanding from the teacher, so these other gifts often make the even greater demand that he himself should be educated. For the day will inevitably come when what the educator teaches by word of mouth no longer works, but only what he is. Every educator—and I use the term in its widest sense—should constantly ask himself whether he is actually fulfilling his teachings in his own person and in his own life, to the best of his knowledge and with a clear conscience. Psychotherapy has taught us that in the final reckoning it is not knowledge, not technical skill, that has a curative effect, but the personality of the doctor. And it is the same with education: it presupposes self-education.

241] In saying this I have no wish to set myself up as a judge over the pedagogues; on the contrary, with my many years as active teacher and educator, I must count myself as one of them and await judgment or condemnation with the rest. It is only on the basis of my experience in treating human beings that I venture to draw your

attention to the profound practical significance of this fundamental educational truth.

242] There are, besides the gifts of the head, also those of the heart, which are no whit less important, although they may easily be overlooked because in such cases the head is often the weaker organ. And yet people of this kind sometimes contribute more to the well-being of society, and are more valuable, than those with other talents. But, like all gifts, talented feeling has two sides to it. A high degree of empathy, especially noticeable in girls, can adapt itself to the teacher so skilfully as to arouse the impression of a special talent, and moreover on the evidence of no mean achievements. But as soon as the personal influence ceases, the gift fizzles out. It was nothing but an enthusiastic episode conjured into existence through empathy, flaring up like a straw fire and leaving the ashes of disappointment behind.

243] The education of gifted children makes considerable demands upon the intellectual, psychological, moral, and artistic capacities of the educator, demands which, it may be, no teacher can reasonably be expected to fulfil. He would have to be something of a genius himself if he were to do justice to the gift of genius among any of his pupils.

244] Fortunately, however, many gifts seem to have a peculiar ability to take care of themselves, and the closer a gifted child comes to being a genius the more his creative capacity—as the very word “genius” implies—acts like a personality far in advance of his years, one might even say like a divine daemon who not only needs no educating, but against whom it is more necessary to protect the child. Great gifts are the fairest, and often the most dangerous, fruits on the tree of humanity. They hang on the weakest branches, which easily break. In most cases, as I have already suggested, the gift develops in inverse ratio to the maturation of the personality as a whole, and often one has the impression that a creative personality grows at the expense of the human being. Sometimes, indeed, there is such a discrepancy between the genius and his human qualities that one has to ask oneself whether a little less talent might not have been better. What after all is great intellect beside moral inferiority? There are not a few gifted persons whose usefulness is paralysed, not to say perverted, by their human shortcomings. A gift is not an absolute value, or rather, it is such a value only when the rest of the personality keeps pace with it, so that the talent can be applied usefully. Creative powers can just as easily turn out to be destructive. It rests solely with the moral personality whether they apply themselves to good things or to bad. And if this is lacking, no teacher can supply it or take its place.

245] The narrow margin between a gift and its pathological variant makes the problem of educating such children much more difficult. Not only is the gift almost invariably compensated by some inferiority in another sphere, but occasionally it is

coupled with a morbid defect. In such cases it is almost impossible to determine whether it is the gift or the psychopathic constitution that predominates.

246] For all these reasons I would hardly like to say whether it would be of advantage to educate particularly gifted pupils in separate classes, as has been proposed.² I at least would not care to be the expert upon whom devolved the selection of suitable pupils. Although it would be an enormous help to the gifted ones, we have still to consider the fact that these same pupils do not always come up to the level of their gifts in other respects, human as well as mental. Segregated in a special class, the gifted child would be in danger of developing into a one-sided product. In a normal class, on the other hand, although he might be bored with the subject in which he excelled, the other subjects would serve to remind him of his backwardness, and this would have a useful and much-needed moral effect. For all gifts have the moral disadvantage of causing in their possessor a feeling of superiority and hence an inflation which needs to be compensated by a corresponding humility. But since gifted children are very often spoilt, they come to expect exceptional treatment. My old teacher was well aware of this, and that is why he delivered his moral “knock-out,” from which I failed at the time to draw the necessary conclusions. Since then I have learnt to see that my teacher was an instrument of fate. He was the first to give me a taste of the hard truth that the gifts of the gods have two sides, a bright and a dark. To rush ahead is to invite blows, and if you don’t get them from the teacher, you will get them from fate, and generally from both. The gifted child will do well to accustom himself early to the fact that any excellence puts him in an exceptional position and exposes him to a great many risks, the chief of which is an exaggerated self-confidence. Against this the only protection is humility and obedience, and even these do not always work.

247] It therefore seems to me better to educate the gifted child along with the other children in a normal class, and not to underline his exceptional position by transferring him to a special class. When all is said and done, school is a part of the great world and contains in miniature all those factors which the child will encounter in later life and with which he will have to come to terms. Some at least of this necessary adaptation can and should be learnt at school. Occasional clashes are not a catastrophe. Misunderstanding is fatal only when chronic, or when the child’s sensitivity is unusually acute and there is no possibility of finding another teacher. That often brings favourable results, but only when the cause of the trouble really does lie with the teacher. This is by no means the rule, for in many cases the teacher has to suffer for the ruin wrought by the child’s upbringing at home. Far too often parents who were unable to fulfil their own ambitions embody them in their gifted child, whom they either pamper or else whip up into a showpiece, sometimes

very much to his detriment in later years, as is sufficiently evident from the lives of certain infant prodigies.

248] A powerful talent, and especially the Danaän gift of genius, is a fateful factor that throws its shadow early before. The genius will come through despite everything, for there is something absolute and indomitable in his nature. The so-called “misunderstood genius” is rather a doubtful phenomenon. Generally he turns out to be a good-for-nothing who is forever seeking a soothing explanation of himself. Once, in my professional capacity, I was forced to confront a “genius” of this type with the alternative: “Or perhaps you are nothing but a lazy hound?” It was not long before we found ourselves in whole-hearted agreement on this point. Talent, on the other hand, can either be hampered, crippled, and perverted, or fostered, developed, and improved. The genius is as rare a bird as the phoenix, an apparition not to be counted upon. Consciously or unconsciously, genius is something that by God’s grace is there from the start, in full strength. But talent is a statistical regularity and does not always have a dynamism to match. Like genius, it is exceedingly diverse in its forms, giving rise to individual differentiations which the educator ought not to overlook; for a differentiated personality, or one capable of differentiation, is of the utmost value to the community. The levelling down of the masses through suppression of the aristocratic or hierarchical structure natural to a community is bound, sooner or later, to lead to disaster. For, when everything outstanding is levelled down, the signposts are lost, and the longing to be led becomes an urgent necessity. Human leadership being fallible, the leader himself has always been, and always will be, subject to the great symbolical principles, even as the individual cannot give his life point and meaning unless he puts his ego at the service of a spiritual authority superordinate to man. The need to do this arises from the fact that the ego never constitutes the whole of a man, but only the conscious part of him. The unconscious part, of unlimited extent, alone can complete him and make him a real totality.

249] Biologically speaking, the gifted person is a deviation from the mean, and in so far as Lao-tzu’s remark that “high stands on low” is one of the eternal verities, this deviation takes place simultaneously in the heights and depths of the same individual. This produces a tension of opposites in him, which in its turn tempers and intensifies his personality. Like the still waters, the gifted child runs deep. His danger lies not only in deviating from the norm, however favourable this may appear to be, but even more in that inner polarity which predisposes to conflict. Therefore, instead of segregation in special classes, the personal interest and attention of the teacher are likely to be more beneficial. Although the institution of a trained school psychiatrist is thoroughly to be recommended and need not be a mere concession to the craze for what is technically right, I would say, in the light of my

own experience, that an understanding heart is everything in a teacher, and cannot be esteemed highly enough. One looks back with appreciation to the brilliant teachers, but with gratitude to those who touched our human feelings. The curriculum is so much necessary raw material, but warmth is the vital element for the growing plant and for the soul of the child.

250] Because there are, among the other pupils, gifted and highly strung natures which ought not to be hemmed in and stifled, the school curriculum should for that very reason never wander too far from the humanities into over specialized fields. The coming generation should at least be shown the doors that lead to the many different departments of life and the mind. And it seems to me especially important for any broad-based culture to have a regard for history in the widest sense of the word. Important as it is to pay attention to what is practical and useful, and to consider the future, that backward glance at the past is just as important. Culture means continuity, not a tearing up of roots through "progress." For the gifted child in particular, a balanced education is essential as a measure of psychic hygiene. As I have said, his gift is one-sided and is almost always offset by some childish immaturity in other regions of the psyche. Childhood, however, is a state of the past. Just as the developing embryo recapitulates, in a sense, our phylogenetic history, so the childpsyche relives "the lesson of earlier humanity," as Nietzsche called it. The child lives in a pre-rational and above all in a prescientific world, the world of the men who existed before us. Our roots lie in that world and every child grows from those roots. Maturity bears him away from his roots and immaturity binds him to them. Knowledge of the universal origins builds the bridge between the lost and abandoned world of the past and the still largely inconceivable world of the future. How should we lay hold of the future, how should we assimilate it, unless we are in possession of the human experience which the past has bequeathed to us? Dispossessed of this, we are without root and without perspective, defenceless dupes of whatever novelties the future may bring. A purely technical and practical education is no safeguard against delusion and has nothing to oppose to the counterfeit. It lacks the culture whose innermost law is the continuity of history, the long procession of man's more than individual consciousness. This continuity which reconciles all opposites also heals the conflicts that threaten the gifted child.

251] Anything new should always be questioned and tested with caution, for it may very easily turn out to be only a new disease. That is why true progress is impossible without mature judgment. But a well-balanced judgment requires a firm standpoint, and this in turn can only rest on a sound knowledge of what has been. The man who is unconscious of the historical context and lets slip his link with the past is in constant danger of succumbing to the crazes and delusions engendered by all novelties. It is the tragedy of all innovators that they empty out the baby with the

bath-water. Though the mania for novelty is not, thank heavens, the national vice of the Swiss, we live nevertheless in a wider world that is being shaken by strange fevers of renewal. In face of this frightening and grandiose spectacle, steadiness is demanded of our young men as never before, firstly for the stability of our country, and secondly for the sake of European civilization, which has nothing to gain if the achievements of the Christian past are wiped out.

252] The gifted ones, however, are the torch-bearers, chosen for that high office by nature herself.

VI

THE SIGNIFICANCE OF THE UNCONSCIOUS IN INDIVIDUAL EDUCATION

THE SIGNIFICANCE OF THE UNCONSCIOUS IN INDIVIDUAL EDUCATION¹

253] In general, one can distinguish three kinds of education:

I. EDUCATION THROUGH EXAMPLE. This kind of education can proceed wholly unconsciously and is therefore the oldest and perhaps the most effective form of all. It is aided by the fact that the child is psychologically more or less identical with its environment, and especially with its parents. This peculiarity is one of the most conspicuous features of the primitive psyche, for which the French anthropologist, Lévy-Bruhl, coined the term “participation mystique.” Because unconscious education through example rests on one of the oldest psychic characteristics, it is effective where all other direct methods fail, as for instance in insanity. Many insane patients have to be made to work in order to keep them from degenerating: to give them advice, or to try to order them about, is in most cases quite useless. But if you just send them along with a group of workers, eventually they get infected by the example of the others and begin to work themselves. In the last analysis, all education rests on this fundamental fact of psychic identity, and in all cases the deciding factor is this seemingly automatic contagion through example. This is so important that even the best methods of conscious education can sometimes be completely nullified by bad example.

254] II. COLLECTIVE EDUCATION. By collective education I do not necessarily mean education *en masse* (as in schools), but education according to rules, principles, and methods. These three things are necessarily of a collective nature, since it is assumed that they are at least valid for and applicable to the large majority of individuals. It is further assumed that they are effective instruments in the hands of all those who have learnt how to manipulate them. We can take it for granted that this kind of education will not produce anything except what is already contained in its premises, and that the individuals it turns out will be moulded by general rules, principles, and methods.

255] To the extent that the individuality of the pupil succumbs to the collective nature of these educational influences, he naturally develops a character much resembling that of another individual, who, though originally quite different, has nevertheless acquiesced in the same way. If there is a large number of individuals who possess this degree of acquiescence, conformity becomes uniformity. The larger the number of individuals who conform, the greater the unconscious pressure of example on all those who, rightly or wrongly, have so far successfully resisted the collective method. And since the example of the crowd exerts a compelling influence through

unconscious psychic contagion, it may in the long run have a crushing effect upon those individuals who possess no more than average strength of character, if it does not extinguish them altogether. Provided that the quality of this training is sound, we may naturally expect good results so far as collective adaptation is concerned. On the other hand, an over-idealistic moulding of character can have disastrous consequences for the unique personality of the individual. To educate him into being a good citizen and a useful member of society is certainly a highly desirable goal. But once a certain level of uniformity is overstepped, and collective values are fostered at the expense of individual uniqueness, then you get the type of person who, though he may be a perfect paragon of the educational rules, principles, and methods, and is therefore adapted to all the situations and problems that come within the scope of his educational premises, nevertheless feels insecure in all matters where individual judgments have to be made without recourse to the regulations.

256] Collective education is indeed a necessity and cannot be replaced by anything else. We live in a collective world, and we need collective norms just as much as we need a common language. On no account must the principle of collective education be sacrificed for the sake of developing individual idiosyncrasies, however much we may desire to prevent the more valuable ones from being stifled. We must bear in mind that individual uniqueness is not under all circumstances an asset, not even for the individual himself. When we examine the type of child who resists collective education, we often find that these children are afflicted with various psychic abnormalities, either congenital or acquired. Among them I would also include spoiled and demoralized children. Many such children actually work out their own salvation by throwing themselves on the support of a normally functioning group. In this way they achieve a certain degree of uniformity, and can protect themselves from the injurious effects of their own individualities. I do not at all subscribe to the view that fundamentally man is always good, and that his evil qualities are merely misunderstood good. On the contrary, I hold that there are very many persons who represent such an inferior combination of inherited characteristics that it would be far better both for society and for themselves if they refrained from expressing their individual idiosyncrasies. We can therefore claim with a clear conscience that collective education is, at bottom, of undoubted value, and absolutely sufficient for most people. We must not, however, make it the sovereign principle of education, for there exists a large group of children who require the third form of education, namely *individual* education.

257] III. INDIVIDUAL EDUCATION. In applying this method, all rules, principles, and systems must be subordinated to the one purpose of bringing out the specific individuality of the pupil. This aim is directly opposed to that of collective

education, which seeks to level out and make uniform. All children who successfully resist this require individual attention. Among these we naturally find the most diverse types. First of all, there are those who are ineducable as a result of pathological degeneration. These generally fall into the category of mental defectives. Then there are others who, far from being ineducable, exhibit special aptitudes, though of a peculiar or one-sided nature. The most frequent of such peculiarities is the incapacity to understand any form of mathematics not expressed in concrete numbers. For this reason higher mathematics ought always to be optional in schools, since it is in no way connected with the development of logical thinking. For these pupils, mathematics is quite meaningless, and a source of needless torment. The truth is that mathematics presupposes a definite mental aptitude which by no means everybody possesses and which cannot be acquired. For those who do not possess it, mathematics can only be learnt by rote like a jumble of meaningless words. Such persons may be highly gifted in every other way, and may possess the capacity for logical thinking already, or can acquire it more easily through direct instruction in logic.

258] Strictly speaking, of course, a deficiency in mathematical ability cannot be regarded as an individual peculiarity. But it does clearly show how a school curriculum may sin against the psychological peculiarity of a pupil. In the same way, certain widely accepted pedagogic principles may prove to be utterly useless, indeed positively harmful, in all cases where the psychological peculiarity of the pupil calls for an exclusively individual influence. Fairly frequently we find that not only specific rules, but the whole apparatus of educational influence is met by an insurmountable antagonism. In such cases we usually have to do with so-called neurotic children. The teacher is at first inclined to ascribe the difficulties to the morbid disposition of the child, but more careful inquiry will often show that the child comes from a peculiar domestic milieu which is quite sufficient to explain his maladjustment. The child has acquired an attitude at home that unfits him for collective life.

259] It is, of course, quite outside the teacher's province to change the home atmosphere, although a little good advice can often work wonders even with parents. As a rule, however, the trouble has to be cured in the child himself, and this means finding the right approach to his peculiar psychology so as to render it amenable to influence. As we have already said, the first requisite is thorough knowledge of his home life. We know a great deal when we have found out the causes of a symptom, but still more is needed. The next thing we need to know is what sort of effects the external causes have produced in the child's psyche. This knowledge we obtain from a thorough investigation of his psychological life-history on the basis of his own and his parents' statements. Under certain conditions a good deal can be accomplished

with just this information. Skilful teachers have applied this method all along, so there is no need for me to dwell on it here.

260] If we realize that the child gradually develops out of the unconscious state into a conscious one, we can understand why practically all environmental influences, or at any rate the most elementary and most lasting of them, are unconscious. The first impressions of life are the strongest and most profound, even though they are unconscious—perhaps indeed for that very reason, for so long as they are unconscious they are not subject to change. We can only correct what is in our consciousness; what is unconscious remains unchanged. Consequently, if we wish to produce a change we must first raise these unconscious contents to consciousness, so as to submit them to correction. This operation is not necessary in cases where a careful investigation of the family environment and of the psychological life-history of the individual has furnished us with the means of influencing him effectively. But in cases where this does not suffice, the investigation must go deeper. It is a species of surgical intervention which can have dire results if performed without adequate technical equipment. It takes considerable medical experience to know just when and where this treatment should be applied. Laymen unfortunately often underestimate the dangers which such interventions entail. By bringing unconscious contents to the surface you artificially create a condition that bears the closest resemblance to a psychosis. The vast majority of mental illnesses (except those of a directly organic nature) are due to a disintegration of consciousness caused by the irresistible invasion of unconscious contents. Accordingly we must know where we can intervene without the risk of harm. Even if no danger threatens from this side, we are still not exempt from certain hazards. One of the commonest consequences of preoccupation with unconscious contents is the development of what Freud called “the transference.” Strictly speaking, transference is the projection of unconscious contents upon the person analysing the unconscious. The term “transference,” however, is used in a much wider sense and embraces all the exceedingly complex processes which bind the patient to the analyst. This bond can turn into an extremely unpleasant obstacle if inexpertly handled. There are cases where it has even led to suicide. One of the main reasons for this is the coming to consciousness of certain unconscious contents which throw a new and disturbing light on the family situation. Things may come up that transform the patient’s love and trust in his parents into resistance and hatred. He then finds himself in an intolerable state of isolation, and will cling desperately to the analyst as his last remaining link with the world. If at this critical juncture the analyst, through some technical blunder, snaps even this link, it can lead straight to suicide.

261] I am therefore of the opinion that so drastic a measure as the analysis of the unconscious should at least be conducted under the control and guidance of a doctor

adequately trained in psychiatry and psychology.

262] In what way, then, can unconscious contents be brought to consciousness? As you will realize, it is hardly possible within the compass of a lecture to describe all the ways in which this may be done. The best practical method, though also the most difficult, is the analysis and interpretation of dreams. Dreams are unquestionably products of unconscious psychic activity. Born in sleep without design or assistance on our part, they pass before our inward vision and may suddenly float back into our waking life on a dim remnant of consciousness. Their strange, often irrational and incomprehensible nature may well inspire mistrust of them as reliable sources of information. And indeed our attempts to understand dreams are scarcely in keeping with any known scientific method of calculation and measurement. Our position is more like that of an archaeologist deciphering an unknown script. Yet, if unconscious contents exist at all, dreams are surely in the best position to tell us something about them. To Freud belongs the great honour of having been the first to demonstrate this possibility in our own day, although all previous ages were deeply preoccupied with the mystery of dreams, nor was this interest always purely superstitious. The work of Artemidorus of Daldis (second century A.D.) on dream interpretation is, of its kind, a scientific document not to be despised, nor should we dismiss as valueless the dream interpretations of the Essenes recorded by Flavius Josephus (b. A.D. 37). Nevertheless, had it not been for Freud, science would probably not have returned so soon to dreams as sources of information, despite the enormous attention paid to them by the physicians of antiquity. Even today opinion is still very much divided on this subject. There are in fact many medical psychologists who refuse to analyse dreams, either because the method seems to them too uncertain, too arbitrary, and too difficult, or because they feel no need of the unconscious. I myself am of the contrary opinion, and have been convinced by ample experience that in all difficult cases the patient's dreams can be of incalculable value to the psychiatrist, both as a source of information and as a therapeutic instrument.

263] Coming now to the much-disputed question of dream-analysis, we proceed in a manner not unlike that employed in the deciphering of hieroglyphs. First we assemble all the available material which the dreamer himself can give as regards the dream images. We next exclude any statements that depend upon particular theoretical assumptions, for those are generally quite arbitrary attempts at interpretation. We then inquire into the happenings of the previous day, as well as into the mood and the general plans and purposes of the dreamer in the days and weeks preceding the dream. A more or less intimate knowledge of his circumstances and character is of course a necessary prerequisite. Great care and attention must be given to this preparatory work if we want to get at the meaning of the dream. I have

no faith in dream interpretations made on the spur of the moment and concocted out of some preconceived theory. One must be careful not to impose any theoretical assumptions on the dream; in fact, it is always best to proceed as if the dream had no meaning at all, so as to be on one's guard against any possible bias. Dream-analysis may yield entirely unforeseen results, and facts of an exceedingly disagreeable nature may sometimes come to light whose discussion would certainly have been avoided at all costs had we been able to anticipate them. We may also get results that are obscure and unintelligible at first, because our conscious standpoint has still not plumbed the secrets of the psyche. In such cases it is better to adopt a waiting attitude than to attempt a forced explanation. In this kind of work one has to put up with a great many question marks.

264] While we are engaged in collecting all this material certain portions of the dream gradually grow clearer, and we begin to see, in the apparently meaningless jumble of images, some glimmerings of a script—only disconnected sentences at first, then more and more of the context. It will perhaps be best if I give you a few examples of the dreams that occur in the course of an individual education under medical control.²

265] I must first acquaint you in some measure with the personality of the dreamer, for without this acquaintance you will hardly be able to transport yourselves into the peculiar atmosphere of the dreams.

266] There are dreams that are pure poems and can therefore only be understood through the mood they convey as a whole. The dreamer is a youth of a little over twenty, still entirely boyish in appearance. There is even a touch of girlishness in his looks and manner of expression. The latter betrays a very good education and upbringing. He is intelligent, with pronounced intellectual and aesthetic interests. His aestheticism is very much in evidence: we are made instantly aware of his good taste and his fine appreciation of all forms of art. His feelings are tender and soft, given to the enthusiasms typical of puberty, but somewhat effeminate. There is no trace of adolescent callowness. Undoubtedly he is too young for his age, a clear case of retarded development. It is quite in keeping with this that he should have come to me on account of his homosexuality. The night preceding his first visit he had the following dream:

267] The dream is clearly a coherent expression of mood. The dreamer's comments are as follows: "Lourdes is the mystic fount of healing. Naturally I remembered yesterday that I was going to you for treatment and was in search of a cure. There is said to be a well like this at Lourdes. It would be rather unpleasant to go down into the water. The well was ever so deep."

"I am in a lofty cathedral filled with mysterious twilight. They tell me that it is the cathedral at Lourdes. In the centre there is a deep dark well, into which I have to

descend.”

268] Now what does this dream tell us? On the surface it seems clear enough, and we might be content to take it as a kind of poetic formulation of the mood of the day before. But we should never stop there, for experience shows that dreams are much deeper and more significant. One might almost suppose that the dreamer came to the doctor in a highly poetic mood and was entering upon the treatment as though it were a sacred religious act to be performed in the mystical half-light of some awe-inspiring sanctuary. But this does not fit the facts at all. The patient merely came to the doctor to be treated for that unpleasant matter, his homosexuality, which is anything but poetic. At any rate we cannot see from the mood of the preceding day why he should dream so poetically, if we were to accept so direct a causation for the origin of the dream. But we might conjecture, perhaps, that the dream was stimulated precisely by the dreamer's impressions of that highly unpoetical affair which impelled him to come to me for treatment. We might even suppose that he dreamed in such an intensely poetical manner just because of the unpoeticalness of his mood on the day before, much as a man who has fasted by day dreams of delicious meals at night. It cannot be denied that the thought of treatment, of the cure and its unpleasant procedure, recurs in the dream, but poetically transfigured, and in a guise which meets most effectively the lively aesthetic and emotional needs of the dreamer. He will be drawn on irresistibly by this inviting picture, despite the fact that the well is dark, deep, and cold. Something of the dream-mood will persist after sleep and will even linger on into the morning of the day on which he has to submit to the unpleasant and unpoetical duty of visiting me. Perhaps the drab reality will be touched by the bright, golden after-glow of the dream feeling.

269] Is this, perhaps, the purpose of the dream? That would not be impossible, for in my experience the vast majority of dreams are compensatory. They always stress the other side in order to maintain the psychic equilibrium. But the compensation of mood is not the only purpose of the dream picture. The dream also provides a mental corrective. The patient had of course nothing like an adequate understanding of the treatment to which he was about to submit himself. But the dream gives him a picture which describes in poetic metaphors the nature of the treatment before him. This becomes immediately apparent if we follow up his associations and comments on the image of the cathedral:

“Cathedral,” he says, “makes me think of Cologne Cathedral. Even as a child I was fascinated by it. I remember my mother telling me of it for the first time, and I also remember how, whenever I saw a village church, I asked if it were Cologne Cathedral. I wanted to be a priest in a cathedral like that.”

270] In these associations the patient is describing a very important experience of his childhood. As in nearly all cases of this kind, he had a particularly close tie with his

mother. By this we are not to understand a particularly good or intense *conscious* relationship, but something in the nature of a secret, subterranean tie which expresses itself consciously, perhaps, only in the retarded development of character, i.e., in a relative infantilism. The developing personality naturally veers away from such an unconscious infantile bond; for nothing is more obstructive to development than persistence in an unconscious—one could also say, a psychically embryonic, condition. For this reason instinct seizes on the first opportunity to replace the mother by another object. If it is to be a real mother-substitute, this object must be, in some sense, an analogy of her. This is entirely the case with our patient. The intensity with which his childish fantasy seized upon the symbol of Cologne Cathedral corresponds to the strength of his unconscious need to find a substitute for the mother. The unconscious need is heightened still further in a case where the infantile bond threatens injury. Hence the enthusiasm with which his childish imagination took up the idea of the Church; for the Church is, in the fullest sense, a mother. We speak not only of Mother Church, but even of the Church's womb. In the ceremony known as the *benedictio fontis*, the baptismal font is apostrophized as *immaculatus divini fontis uterus*—"immaculate womb of the divine fount." We naturally think that a man must have known this meaning consciously before it could get to work on his fantasy, and that an unknowing child could not possibly be affected by these significations. Such analogies certainly do not work by way of the conscious mind, but in quite another manner.

271] The Church represents a higher spiritual substitute for the purely natural, or "carnal," tie to the parents. Consequently it frees the individual from an unconscious natural relationship which, strictly speaking, is not a relationship at all but simply a condition of inchoate, unconscious identity. This, just because it is unconscious, possesses a tremendous inertia and offers the utmost resistance to any kind of spiritual development. It would be hard to say what the essential difference is between this condition and the soul of an animal. Now, it is by no means the special prerogative of the Christian Church to try to make it possible for the individual to detach himself from his original, animal-like condition; the Church is simply the latest, and specifically Western, form of an instinctive striving that is probably as old as mankind itself. It is a striving that can be found in the most varied forms among all primitive peoples who are in any way developed and have not yet become degenerate: I mean the institution or rite of initiation into manhood. When he has reached puberty the young man is conducted to the "men's house," or some other place of consecration, where he is systematically alienated from his family. At the same time he is initiated into the religious mysteries, and in this way is ushered not only into a wholly new set of relationships, but, as a renewed and changed personality, into a new world, like one reborn (*quasi modo genitus*). The initiation is

often attended by all kinds of tortures, sometimes including circumcision and the like. These practices are undoubtedly very old. They have almost become instinctive mechanisms, with the result that they continue to repeat themselves without external compulsion, as in the “baptisms” of German students or the even more wildly extravagant initiations in American students’ fraternities. They have become engraved in the unconscious in the form of a primordial image, an archetype, as St. Augustine calls it.

272] When his mother told him as a little boy about Cologne Cathedral, this primordial image was stirred and awakened to life. But there was no priestly instructor to develop it further, so the child remained in his mother’s hands. Yet the longing for a man’s leadership continued to grow in the boy, taking the form of homosexual leanings—a faulty development that might never have come about had a man been there to educate his childish fantasies. The deviation towards homosexuality has, to be sure, numerous historical precedents. In ancient Greece, as also in certain primitive communities, homosexuality and education were practically synonymous. Viewed in this light, the homosexuality of adolescence is only a profound misunderstanding of the otherwise very appropriate need for masculine guidance.

273] According to the dream, then, what the initiation of the treatment signifies for the patient is the fulfilment of the true meaning of his homosexuality, i.e., his entry into the world of adult men. All that we have been forced to discuss here in such tedious and long-winded detail, in order to understand it properly, the dream has condensed into a few vivid metaphors, thus creating a picture which works far more effectively on the imagination, feeling, and understanding of the dreamer than any learned discourse. Consequently the patient was better and more intelligently prepared for the treatment than if he had been overwhelmed with medical and pedagogical maxims. For this reason I regard dreams not only as a valuable source of information but as an extraordinarily effective instrument of education and therapy.

274] I shall now give you the second dream, which the patient dreamt on the night following his first visit to me. It makes certain welcome additions to the previous one. I must explain in advance that during the first consultation I did not refer in any way to the dream we have just been discussing. It was not even mentioned. Nor was there a word said that was even remotely connected with the foregoing.

275] The second dream was as follows:

“I am in a great Gothic cathedral. At the altar stands a priest. I stand before him with my friend, holding in my hand a little Japanese ivory figure, with the feeling that it is going to be baptized. Suddenly an elderly woman appears, takes the fraternity ring from my friend’s finger, and puts it on her own. My friend is afraid that this may bind him in some way. But at the same time there is a sound of wonderful organ music.”

276] Unfortunately I cannot, within the short space of a lecture, enter into all the details of this exceedingly ingenious dream. Here I will only bring out briefly those points which continue and supplement the dream of the preceding day. The second dream is unmistakably connected with the first: once more the dreamer is in church, that is, in the state of initiation into manhood. But a new figure has been added: the priest, whose absence in the previous situation we have already noted. The dream therefore confirms that the unconscious meaning of his homosexuality has been fulfilled and that a new development can be started. The actual initiation ceremony, that is, the baptism, may now begin. The dream symbolism corroborates what I said before, namely that it is not the prerogative of the Christian Church to bring about such transitions and psychic transformations, but that behind the Church there is a living primordial image which in certain conditions is capable of enforcing them.

277] What, according to the dream, is to be baptized is a little Japanese ivory figure. The patient says of this: "It was a tiny, grotesque little manikin that reminded me of the male organ. It was certainly odd that this member was to be baptized. But after all, with the Jews circumcision is a sort of baptism. That must be a reference to my homosexuality, because the friend standing with me before the altar is the one with whom I have sexual relations. We belong to the same fraternity. The fraternity ring obviously stands for our relationship."

278] We know that in common usage the ring is the token of a bond or relationship, as for example the wedding ring. We can therefore safely take the fraternity ring in this case as symbolizing the homosexual relationship, and the fact that the dreamer appears together with his friend points in the same direction.

279] The complaint to be remedied is homosexuality. The dreamer is to be led out of this relatively childish condition and initiated into the adult state by means of a kind of circumcision ceremony under the supervision of a priest. These ideas correspond exactly to my analysis of the previous dream. Thus far the development has proceeded logically and consistently with the aid of archetypal images. But now a disturbing factor appears to enter. An elderly woman suddenly takes possession of the fraternity ring; in other words, she draws to herself what has hitherto been a homosexual relationship, thus causing the dreamer to fear that he is getting involved in a new relationship with obligations of its own. Since the ring is now on the hand of a woman, a marriage of sorts has been contracted, i.e., the homosexual relationship seems to have passed over into a heterosexual one, but a heterosexual relationship of a peculiar kind, as it concerns an elderly woman. "She is a friend of my mother's," says the patient. "I am very fond of her, in fact she is like a mother to me." From this remark we can see what has happened in the dream: as a result of the initiation the homosexual tie has been cut and a heterosexual relationship substituted for it, a platonic friendship with a woman resembling his mother. In spite of her

resemblance to his mother, this woman is not his mother any longer, so the relationship with her signifies a step beyond the mother towards masculinity, and hence a partial conquest of his adolescent homosexuality.

280] The fear of the new tie can easily be understood, firstly as the fear which the woman's resemblance to his mother might naturally arouse—it could be argued that the dissolution of the homosexual tie has led to a complete regression to the mother—and secondly as the fear of the new and unknown factors in the adult heterosexual state with its possible obligations, such as marriage, and so on. That we are in fact concerned here not with a regression but with an advance seems to be confirmed by the music that now peals forth. The patient is musical and especially susceptible to solemn organ music. Therefore music signifies for him a very positive feeling, so in this case it forms an harmonious conclusion to the dream, which in turn is well qualified to leave behind a beautiful, holy feeling for the following morning.

281] If you consider the fact that up to now the patient had seen me for only one consultation, in which little more was discussed than a general anamnesis, you will doubtless agree with me when I say that both dreams make astonishing anticipations. They show the patient's situation in a highly remarkable light, and one that is very strange to the conscious mind, while at the same time they lend to the banal medical situation an aspect that is uniquely attuned to the psychic peculiarities of the dreamer, and thus capable of stringing his aesthetic, intellectual, and religious interests to concert pitch. No better conditions for treatment could possibly be imagined. One is almost persuaded, from the meaning of these dreams, that the patient entered upon the treatment with the utmost readiness and hopefulness, quite prepared to cast aside his boyishness and become a man. In reality, however, this was not the case at all. Consciously he was full of hesitation and resistance; moreover, as the treatment progressed, he constantly showed himself antagonistic and difficult, ever ready to slip back into his previous infantilism. The dreams, therefore, stand in strict contrast to his conscious behaviour. They move along a progressive line and are on the side of the educator. In my opinion they give us a clear view of the specific function of dreams. This function I have called compensation. The unconscious progressiveness and the conscious regressiveness together form a pair of opposites which, as it were, keeps the scales balanced. The influence of the educator tilts the balance in favour of progression. In this way dreams give effective support to our educational efforts and at the same time afford the deepest insight into the intimate fantasy life of the patient. Thus his conscious attitude gradually becomes more understanding and receptive to new influences.

282] From what has been said it might be inferred that, were all dreams to behave in this manner, they would be an incomparable means of access to the most individual secrets of psychic life. In so far as dreams are capable of explanation, this is actually

true as a general rule; but the great difficulty nevertheless remains of explaining them. Not only is wide experience and considerable tact needed, but also knowledge. To interpret dreams on the basis of a general theory, or on certain ready-made suppositions, is not merely ineffectual, but a definitely wrong and harmful practice. By the gentle art of persuasion and by the liberal use of alleged dream-mechanisms like inversion, distortion, displacement and what not, the dream can be construed to yield almost any meaning. The same arbitrary procedures were also to be found in the first attempts to decipher hieroglyphs. Before even attempting to understand a dream we ought always to say to ourselves, "This dream can mean anything." It need not stand in opposition to the conscious attitude, but may simply run parallel to it, which would also be quite in accord with its compensatory function. Moreover, there are dreams that defy every effort at interpretation. Often the only possible thing is to hazard a guess. At any rate, up to the present no open sesame for dreams has been discovered, no infallible method, and no absolutely satisfactory theory. The Freudian hypothesis that all dreams are the disguised fulfilment of sexual and other morally inadmissible wishes I myself cannot corroborate. I must therefore regard the use of this hypothesis and the tactics based upon it as a subjective bias. Indeed, I am persuaded that, in view of the tremendous irrationality and individuality of dreams, it may be altogether outside the bounds of possibility to construct a popular theory. Why should we believe that everything without exception is a fit subject for science? Scientific thinking is only one of the mental faculties at our disposal for understanding the world. It might be better to look upon dreams as being more in the nature of works of art instead of mere observational data for the scientist. The first view seems to me to yield better results because it is nearer to the essential nature of dreams. And this, after all, is the main point, that we should make ourselves aware of our unconscious compensation and thus overcome the one-sidedness and inadequacy of the conscious attitude. So long as other methods of education are efficacious and useful, we do not need the assistance of the unconscious. Indeed it would be a most reprehensible blunder if we tried to substitute analysis of the unconscious for well-tried conscious methods. The analytical method should be strictly reserved for those cases where other methods have failed, and should then be practised only by specialists, or by laymen under specialist control and guidance.

283] The general results of such psychiatric studies and methods are not of mere academic interest to the educator; they may also be of very real help, since in certain cases they furnish him with an insight unattainable without such knowledge.

VII

THE DEVELOPMENT OF PERSONALITY

THE DEVELOPMENT OF PERSONALITY¹

[284] In somewhat free-handed fashion the last two lines of Goethe's stanza are often quoted:

The Highest bliss on earth shall be
The joys of personality!²

This gives expression to the view that the ultimate aim and strongest desire of all mankind is to develop that fulness of life which is called personality. Nowadays, "personality training" has become an educational ideal that turns its back upon the standardized, mass-produced, "normal" human being demanded by the machine age. It thus pays tribute to the historical fact that the great liberating deeds of world history have sprung from leading personalities and never from the inert mass, which is at all times secondary and can only be prodded into activity by the demagogue. The huzzahs of the Italian nation go forth to the personality of the Duce, and the dirges of other nations lament the absence of strong leaders.³ The yearning for personality has therefore become a real problem that occupies many minds today, whereas in former times there was only one man who had a glimmering of this question—Friedrich Schiller, whose letters on aesthetic education have lain dormant, like a Sleeping Beauty of literature, for more than a century. We may confidently assert that the "Holy Roman Empire of the German Nation" has not taken much notice of Schiller as an educator. On the other hand, the *furor teutonicus* has hurled itself upon pedagogics (in the strict sense of the education of children), delved into child psychology, ferreted out the infantilism of the adult, and made of childhood such a portentous condition of life and human fate that it completely overshadows the creative meaning and potentialities of adult existence. Our age has been extravagantly praised as the "century of the child." This boundless expansion of the kindergarten amounts to complete forgetfulness of the problems of adult education divined by the genius of Schiller. Nobody will deny or underestimate the importance of childhood; the severe and often life-long injuries caused by stupid upbringing at home or in school are too obvious, and the need for more reasonable pedagogic methods is far too urgent. But if this evil is to be attacked at the root, one must in all seriousness face the question of how such idiotic and bigoted methods of education ever came to be employed, and still are employed. Obviously, for the sole reason that there are half-baked educators who are not human beings at all, but walking personifications of method. Anyone who wants to educate must himself be educated. But the parrot-like book-learning and mechanical use of methods that is still practised

today is no education either for the child or for educator. People are everlastingly saying that the child's personality must be trained. While I admire this lofty ideal, I can't help asking who it is that trains the personality? In the first and foremost place we have the parents, ordinary, incompetent folk who, more often than not, are half children themselves and remain so all their lives. How could anyone expect all these ordinary parents to be "personalities," and who has ever given a thought to devising methods for inculcating "personality" into them? Naturally, then, we expect great things of the pedagogue, of the trained professional, who, heaven help us, has been stuffed full of "psychology" and is bursting with ill-assorted views as to how the child is supposed to be constituted and how he ought to be handled. It is presumed that the youthful persons who have picked on education as a career are themselves educated; but nobody, I daresay, will venture to assert that they are all "personalities" as well. By and large, they suffer from the same defective education as the hapless children they are supposed to instruct, and as a rule are as little "personalities" as their charges. Our whole educational problem suffers from a one-sided approach to the child who is to be educated, and from an equally one-sided lack of emphasis on the uneducatedness of the educator. Everyone who has finished his course of studies feels himself to be fully educated; in a word, he feels grown up. He must feel this, he must have this solid conviction of his own competence in order to survive the struggle for existence. Any doubt or feeling of uncertainty would hinder and cripple him, undermining the necessary faith in his own authority and unfitting him for a professional career. People expect him to be efficient and good at his job and not to have doubts about himself and his capabilities. The professional man is irretrievably condemned to be competent.

285] Everyone knows that these conditions are not ideal. But, with reservations, we can say that they are the best possible under the circumstances. We cannot imagine how they could be different. We cannot expect more from the average educator than from the average parent. If he is good at his job, we have to be content with that, just as we have to be content with parents bringing up their children as best they can.

286] The fact is that the high ideal of educating the personality is not for children: for what is usually meant by personality—a well-rounded psychic whole that is capable of resistance and abounding in energy—is an *adult ideal*. It is only in an age like ours, when the individual is unconscious of the problems of adult life, or—what is worse—when he consciously shirks them, that people could wish to foist this ideal on to childhood. I suspect our contemporary pedagogical and psychological enthusiasm for the child of dishonourable intentions: we talk about the child, but we should mean the child in the adult. For in every adult there lurks a child—an eternal child,⁴ something that is always becoming, is never completed, and calls for unceasing care, attention, and education. That is the part of the human personality which wants to develop and become whole. But the man of today is far indeed from

this wholeness. Dimly suspecting his own deficiencies, he seizes upon child education and fervently devotes himself to child psychology, fondly supposing that something must have gone wrong in his own upbringing and childhood development that can be weeded out in the next generation. This intention is highly commendable, but comes to grief on the psychological fact that we cannot correct in a child a fault that we ourselves still commit. Children are not half as stupid as we imagine. They notice only too well what is genuine and what is not. Hans Andersen's story of the emperor's clothes contains a perennial truth. How many parents have come to me with the laudable intention of sparing their children the unhappy experiences they had to go through in their own childhood! And when I ask, "Are you quite sure you have overcome these mistakes yourself?" they are firmly convinced that the damage has long since been repaired. In actual fact it has not. If as children they were brought up too strictly, then they spoil their own children with a tolerance bordering on bad taste; if certain matters were painfully concealed from them in childhood, these are revealed with a lack of reticence that is just as painful. They have merely gone to the opposite extreme, the strongest evidence for the tragic survival of the old sin—a fact which has altogether escaped them.

287] If there is anything that we wish to change in our children, we should first examine it and see whether it is not something that could better be changed in ourselves. Take our enthusiasm for pedagogics. It may be that the boot is on the other leg. It may be that we misplace the pedagogical need because it would be an uncomfortable reminder that we ourselves are still children in many respects and still need a vast amount of educating.

288] At any rate this doubt seems to me to be extremely pertinent when we set out to train our children's "personalities." Personality is a seed that can only develop by slow stages throughout life. There is no personality without definiteness, wholeness, and ripeness. These three qualities cannot and should not be expected of the child, as they would rob it of childhood. It would be nothing but an abortion, a premature pseudo-adult; yet our modern education has already given birth to such monsters, particularly in those cases where parents set themselves the fanatical task of always "doing their best" for the children and "living only for them." This clamant ideal effectively prevents the parents from doing anything about their own development and allows them to thrust their "best" down their children's throats. This so-called "best" turns out to be the very things the parents have most badly neglected in themselves. In this way the children are goaded on to achieve their parents' most dismal failures, and are loaded with ambitions that are never fulfilled. Such methods and ideals only engender educational monstrosities.

289] No one can train the personality unless he has it himself. And it is not the child, but only the adult, who can achieve personality as the fruit of a full life directed to this end. The achievement of personality means nothing less than the optimum development of the whole individual human being. It is impossible to foresee the endless variety of conditions that have to be fulfilled. A whole lifetime, in all its biological, social, and spiritual aspects, is needed. Personality is the supreme realization of the innate idiosyncrasy of a living being. It is an act of high courage flung in the face of life, the absolute affirmation of all that constitutes the individual, the most successful adaptation to the universal conditions of existence coupled with the greatest possible freedom for self-determination. To educate a man to *this* seems to me no light matter. It is surely the hardest task the modern mind has set itself. And it is dangerous too, dangerous to a degree that Schiller never imagined, though his prophetic insight made him the first to venture upon these problems. It is as dangerous as the bold and hazardous undertaking of nature to let women bear children. Would it not be sacrilege, a Promethean or even Luciferian act of presumption, if a superman ventured to grow an homunculus in a bottle and then found it sprouting into a Golem? And yet he would not be doing anything that nature does not do every day. There is no human horror or fairground freak that has not lain in the womb of a loving mother. As the sun shines upon the just and the unjust, and as women who bear and give suck tend God's children and the devil's brood with equal compassion, unconcerned about the possible consequences, so we also are part and parcel of this amazing nature, and, like it, carry within us the seeds of the unpredictable.

290] Our personality develops in the course of our life from germs that are hard or impossible to discern, and it is only our deeds that reveal who we are. We are like the sun, which nourishes the life of the earth and brings forth every kind of strange, wonderful, and evil thing; we are like the mothers who bear in their wombs untold happiness and suffering. At first we do not know what deeds or misdeeds, what destiny, what good and evil we have in us, and only the autumn can show what the spring has engendered, only in the evening will it be seen what the morning began.

291] Personality, as the complete realization of our whole being, is an unattainable ideal. But unattainability is no argument against the ideal, for ideals are only signposts, never the goal.

292] Just as the child must develop in order to be educated, so the personality must begin to sprout before it can be trained. And this is where the danger begins. For we are handling something unpredictable, we do not know how and in what direction the budding personality will develop, and we have learned enough of nature and the world to be somewhat chary of both. On top of that, we were brought up in the Christian belief that human nature is intrinsically evil. But even those who no longer

adhere to the Christian teaching are by nature mistrustful and not a little frightened of the possibilities lurking in the subterranean chambers of their being. Even enlightened psychologists like Freud give us an extremely unpleasant picture of what lies slumbering in the depths of the human psyche. So it is rather a bold venture to put in a good word for the development of personality. Human nature, however, is full of the strangest contradictions. We praise the “sanctity of motherhood,” yet would never dream of holding it responsible for all the human monsters, the homicidal maniacs, dangerous lunatics, epileptics, idiots and cripples of every description who are born every day. At the same time we are tortured with doubts when it comes to allowing the free development of personality. “Anything might happen then,” people say. Or they dish up the old, feeble-minded objection to “individualism.” But individualism is not and never has been a natural development; it is nothing but an unnatural usurpation, a freakish, impertinent pose that proves its hollowness by crumpling up before the least obstacle. What we have in mind is something very different.

293] Clearly, no one develops his personality because somebody tells him that it would be useful or advisable to do so. Nature has never yet been taken in by well-meaning advice. The only thing that moves nature is causal necessity, and that goes for human nature too. Without necessity nothing budes, the human personality least of all. It is tremendously conservative, not to say torpid. Only acute necessity is able to rouse it. The developing personality obeys no caprice, no command, no insight, only brute necessity; it needs the motivating force of inner or outer fatalities. Any other development would be no better than individualism. That is why the cry of “individualism” is a cheap insult when flung at the natural development of personality.

294] The words “many are called, but few are chosen” are singularly appropriate here, for the development of personality from the germ-state to full consciousness is at once a charisma and a curse, because its first fruit is the conscious and unavoidable segregation of the single individual from the undifferentiated and unconscious herd. This means isolation, and there is no more comforting word for it. Neither family nor society nor position can save him from this fate, nor yet the most successful adaptation to his environment, however smoothly he fits in. The development of personality is a favour that must be paid for dearly. But the people who talk most loudly about developing their personalities are the very ones who are least mindful of the results, which are such as to frighten away all weaker spirits.

295] Yet the development of personality means more than just the fear of hatching forth monsters, or of isolation. It also means fidelity to the law of one’s own being.

296] For the word “fidelity” I should prefer, in this context, the Greek word used in the New Testament, *πίστις* which is erroneously translated “faith.” It really means

“trust,” “trustful loyalty.” Fidelity to the law of one’s own being is a trust in this law, a loyal perseverance and confident hope; in short, an attitude such as a religious man should have towards God. It can now be seen how portentous is the dilemma that emerges from behind our problem: personality can never develop unless the individual chooses his own way, consciously and with moral deliberation. Not only the causal motive—necessity—but conscious moral decision must lend its strength to the process of building the personality. If the first is lacking, then the alleged development is a mere acrobatics of the will; if the second, it will get stuck in unconscious automatism. But a man can make a moral decision to go his own way only if he holds that way to be the best. If any other way were held to be better, then he would live and develop that other personality instead of his own. The other ways are conventionalities of a moral, social, political, philosophical, or religious nature. The fact that the conventions always flourish in one form or another only proves that the vast majority of mankind do not choose their own way, but convention, and consequently develop not themselves but a method and a collective mode of life at the cost of their own wholeness.

297] Just as the psychic and social life of mankind at the primitive level is exclusively a group life with a high degree of unconsciousness among the individuals composing it, so the historical process of development that comes afterwards is in the main collective and will doubtless remain so. That is why I believe convention to be a collective necessity. It is a stopgap and not an ideal, either in the moral or in the religious sense, for submission to it always means renouncing one’s wholeness and running away from the final consequences of one’s own being.

298] To develop one’s own personality is indeed an unpopular undertaking, a deviation that is highly uncongenial to the herd, an eccentricity smelling of the cenobite, as it seems to the outsider. Small wonder, then, that from earliest times only the chosen few have embarked upon this strange adventure. Had they all been fools, we could safely dismiss them as *ἰδιῶται*, mentally “private” persons who have no claim on our interest. But, unfortunately, these personalities are as a rule the legendary heroes of mankind, the very ones who are looked up to, loved, and worshipped, the true sons of God whose names perish not. They are the flower and the fruit, the ever fertile seeds of the tree of humanity. This allusion to historical personalities makes it abundantly clear why the development of personality is an ideal, and why the cry of individualism is an insult. Their greatness has never lain in their abject submission to convention, but, on the contrary, in their deliverance *from* convention. They towered up like mountain peaks above the mass that still clung to its collective fears, its beliefs, laws, and systems, and boldly chose their own way. To the man in the street it has always seemed miraculous that anyone should turn aside from the beaten track with its known destinations, and strike out on the steep and narrow path

leading into the unknown. Hence it was always believed that such a man, if not actually crazy, was possessed by a daemon or a god; for the miracle of a man being able to act otherwise than as humanity has always acted could only be explained by the gift of daemonic power or divine spirit. How could anyone but a god counterbalance the dead weight of humanity in the mass, with its everlasting convention and habit? From the beginning, therefore, the heroes were endowed with godlike attributes. According to the Nordic view they had snake's eyes, and there was something peculiar about their birth or descent; certain heroes of ancient Greece were snake-souled, others had a personal daemon, were magicians or the elect of God. All these attributes, which could be multiplied at will, show that for the ordinary man the outstanding personality is something *supernatural*, a phenomenon that can only be explained by the intervention of some daemonic factor.

299] What is it, in the end, that induces a man to go his own way and to rise out of unconscious identity with the mass as out of a swathing mist? Not necessity, for necessity comes to many, and they all take refuge in convention. Not moral decision, for nine times out of ten we decide for convention likewise. What is it, then, that inexorably tips the scales in favour of the *extra-ordinary*?

300] It is what is commonly called *vocation*: an irrational factor that destines a man to emancipate himself from the herd and from its well-worn paths. True personality is always a vocation and puts its trust in it as in God, despite its being, as the ordinary man would say, only a personal feeling. But vocation acts like a law of God from which there is no escape. The fact that many a man who goes his own way ends in ruin means nothing to one who has a vocation. He *must* obey his own law, as if it were a daemon whispering to him of new and wonderful paths. Anyone with a vocation hears the voice of the inner man: he is *called*. That is why the legends say that he possesses a private daemon who counsels him and whose mandates he must obey. The best known example of this is Faust, and an historical instance is provided by the daemon of Socrates. Primitive medicine-men have their snake spirits, and Aesculapius, the tutelary patron of physicians, has for his emblem the Serpent of Epidaurus. He also had, as his private daemon, the Cabir Telesphoros, who is said to have dictated or inspired his medical prescriptions.

301] The original meaning of "to have a vocation" is "to be addressed by a voice." The clearest examples of this are to be found in the avowals of the Old Testament prophets. That it is not just a quaint old-fashioned way of speaking is proved by the confessions of historical personalities such as Goethe and Napoleon, to mention only two familiar examples, who made no secret of their feeling of vocation.

302] Vocation, or the feeling of it, is not, however, the prerogative of great personalities; it is also appropriate to the small ones all the way down to the "midget" personalities, but as the size decreases the voice becomes more and more

muffled and unconscious. It is as if the voice of the daemon within were moving further and further off, and spoke more rarely and more indistinctly. The smaller the personality, the dimmer and more unconscious it becomes, until finally it merges indistinguishably with the surrounding society, thus surrendering its own wholeness and dissolving into the wholeness of the group. In the place of the inner voice there is the voice of the group with its conventions, and vocation is replaced by collective necessities. But even in this unconscious social condition there are not a few who are called awake by the summons of the voice, whereupon they are at once set apart from the others, feeling themselves confronted with a problem about which the others know nothing. In most cases it is impossible to explain to the others what has happened, for any understanding is walled off by impenetrable prejudices. "You are no different from anybody else," they will chorus, or, "there's no such thing," and even if there is such a thing, it is immediately branded as "morbid" and "most unseemly." For it is "a monstrous presumption to suppose anything of that sort could be of the slightest significance"—it is "purely psychological." This last objection is extremely popular nowadays. It stems from a curious underestimation of anything psychic, which people apparently regard as personal, arbitrary, and therefore completely futile. And this, paradoxically enough, despite their enthusiasm for psychology. The unconscious, after all, is "nothing but fantasy." We "merely imagined" so and so, etc. People think themselves magicians who can conjure the psyche hither and thither and fashion it to suit their moods. They deny what strikes them as inconvenient, sublimate anything nasty, explain away their phobias, correct their faults, and feel in the end that they have arranged everything beautifully. In the meantime they have forgotten the essential point, which is that only the tiniest fraction of the psyche is identical with the conscious mind and its box of magic tricks, while for much the greater part it is sheer unconscious *fact*, hard and immitigable as granite, immovable, inaccessible, yet ready at any time to come crashing down upon us at the behest of unseen powers. The gigantic catastrophes that threaten us today are not elemental happenings of a physical or biological order, but psychic events. To a quite terrifying degree we are threatened by wars and revolutions which are nothing other than psychic epidemics. At any moment several millions of human beings may be smitten with a new madness, and then we shall have another world war or devastating revolution. Instead of being at the mercy of wild beasts, earthquakes, landslides, and inundations, modern man is battered by the elemental forces of his own psyche. This is the World Power that vastly exceeds all other powers on earth. The Age of Enlightenment, which stripped nature and human institutions of gods, overlooked the God of Terror who dwells in the human soul. If anywhere, fear of God is justified in face of the overwhelming supremacy of the psychic.

303] But all this is so much abstraction. Everyone knows that the intellect, that clever jackanapes, can put it this way or any other way he pleases. It is a very different thing when the psyche, as an objective fact, hard as granite and heavy as lead, confronts a man as an inner experience and addresses him in an audible voice, saying, "This is what will and must be." Then he feels himself called, just as the group does when there's a war on, or a revolution, or any other madness. It is not for nothing that our age calls for the redeemer personality, for the one who can emancipate himself from the inescapable grip of the collective and save at least his own soul, who lights a beacon of hope for others, proclaiming that here is at least *one* man who has succeeded in extricating himself from that fatal identity with the group psyche. For the group, because of its unconsciousness, has no freedom of choice, and so psychic activity runs on in it like an uncontrolled law of nature. There is thus set going a chain reaction that comes to a stop only in catastrophe. The people always long for a hero, a slayer of dragons, when they feel the danger of psychic forces; hence the cry for personality.

304] But what has the individual personality to do with the plight of the many? In the first place he is part of the people as a whole, and is as much at the mercy of the power that moves the whole as anybody else. The only thing that distinguishes him from all the others is his vocation. He has been called by that all-powerful, all-tyrannizing psychic necessity that is his own and his people's affliction. If he hearkens to the voice, he is at once set apart and isolated, as he has resolved to obey the law that commands him from within. "His *own* law!" everybody will cry. But he knows better: it is *the* law, *the* vocation for which he is destined, no more "his own" than the lion that fells him, although it is undoubtedly this particular lion that kills him and not any other lion. Only in this sense is he entitled to speak of "his" vocation, "his" law.

305] With the decision to put his way above all other possible ways he has already fulfilled the greater part of his vocation as a redeemer. He has invalidated all other ways for himself, exalting his law above convention and thus making a clean sweep of all those things that not only failed to prevent the great danger but actually accelerated it. For conventions in themselves are soulless mechanisms that can never understand more than the mere routine of life. Creative life always stands outside convention. That is why, when the mere routine of life predominates in the form of convention and tradition, there is bound to be a destructive outbreak of creative energy. This outbreak is a catastrophe only when it is a mass phenomenon, but never in the individual who consciously submits to these higher powers and serves them with all his strength. The mechanism of convention keeps people unconscious, for in that state they can follow their accustomed tracks like blind brutes, without the need for conscious decision. This unintended result of even the best conventions is

unavoidable but is no less a terrible danger for that. For when new conditions arise that are not provided for under the old conventions, then, just as with animals, panic is liable to break out among human beings kept unconscious by routine, and with equally unpredictable results.

306] Personality, however, does not allow itself to be seized by the panic terror of those who are just waking to consciousness, for it has put all its terrors behind it. It is able to cope with the changing times, and has unknowingly and involuntarily become a *leader*.

307] All human beings are much alike, otherwise they could not succumb to the same delusion, and the psychic substratum upon which the individual consciousness is based is universally the same, otherwise people could never reach a common understanding. So, in this sense, personality and its peculiar psychic make-up are not something absolutely unique. The uniqueness holds only for the *individual* nature of the personality, as it does for each and every individual. To become a personality is not the absolute prerogative of the genius, for a man may be a genius without being a personality. In so far as every individual has the law of his life inborn in him, it is theoretically possible for any man to follow this law and so become a personality, that is, to achieve wholeness. But since life only exists in the form of living units, i.e., individuals, the law of life always tends towards a life individually lived. So although the objective psyche can only be conceived as a universal and uniform datum, which means that all men share the same primary, psychic condition, this objective psyche must nevertheless individuate itself if it is to become actualized, for there is no other way in which it could express itself except through the individual human being. The only exception to this is when it seizes hold of a group, in which case it must, of its own nature, precipitate a catastrophe, because it can only operate unconsciously and is not assimilated by any consciousness or assigned its place among the existing conditions of life.

308] Only the man who can consciously assent to the power of the inner voice becomes a personality; but if he succumbs to it he will be swept away by the blind flux of psychic events and destroyed. That is the great and liberating thing about any genuine personality: he voluntarily sacrifices himself to his vocation, and consciously translates into his own individual reality what would only lead to ruin if it were lived unconsciously by the group.

309] One of the most shining examples of the meaning of personality that history has preserved for us is the life of Christ. In Christianity, which, be it mentioned in passing, was the only religion really persecuted by the Romans, there rose up a direct opponent of the Caesarean madness that afflicted not only the emperor, but every Roman as well: *civis Romanus sum*. The opposition showed itself wherever the worship of Caesar clashed with Christianity. But, as we know from what the

evangelists tell us about the psychic development of Christ's personality, this opposition was fought out just as decisively in the soul of its founder. The story of the Temptation clearly reveals the nature of the psychic power with which Jesus came into collision: it was the power-intoxicated devil of the prevailing Caesarean psychology that led him into dire temptation in the wilderness. This devil was the objective psyche that held all the peoples of the Roman Empire under its sway, and that is why it promised Jesus all the kingdoms of the earth, as if it were trying to make a Caesar of him. Obeying the inner call of his vocation, Jesus voluntarily exposed himself to the assaults of the imperialistic madness that filled everyone, conqueror and conquered alike. In this way he recognized the nature of the objective psyche which had plunged the whole world into misery and had begotten a yearning for salvation that found expression even in the pagan poets. Far from suppressing or allowing himself to be suppressed by this psychic onslaught, he let it act on him consciously, and assimilated it. Thus was world-conquering Caesarism transformed into spiritual kingship, and the Roman Empire into the universal kingdom of God that was not of this world. While the whole Jewish nation was expecting an imperialistically minded and politically active hero as a Messiah, Jesus fulfilled the Messianic mission not so much for his own nation as for the whole Roman world, and pointed out to humanity the old truth that where force rules there is no love, and where love reigns force does not count. The religion of love was the exact psychological counterpart to the Roman devil-worship of power.

310] The example of Christianity is perhaps the best illustration of my previous abstract argument. This apparently unique life became a sacred symbol because it is the psychological prototype of the only meaningful life, that is, of a life that strives for the individual realization—absolute and unconditional—of its own particular law. Well may we exclaim with Tertullian; *anima naturaliter christiana!*

311] The deification of Jesus, as also of the Buddha, is not surprising, for it affords a striking example of the enormous valuation that humanity places upon these hero figures and hence upon the ideal of personality. Though it seems at present as if the blind and destructive dominance of meaningless collective forces would thrust the ideal of personality into the background, yet this is only a passing revolt against the dead weight of history. Once the revolutionary, unhistorical, and therefore uneducated inclinations of the rising generation have had their fill of tearing-down tradition, new heroes will be sought and found. Even the Bolsheviks, whose radicalism leaves nothing to be desired, have embalmed Lenin and made a saviour of Karl Marx. The ideal of personality is one of the ineradicable needs of the human soul, and the more unsuitable it is the more fanatically it is defended. Indeed, the worship of Caesar was itself a misconceived cult of personality, and modern

Protestantism, whose critical theology has reduced the divinity of Christ to vanishing point, has found its last refuge in the personality of Jesus.

312] Yes, this thing we call personality is a great and mysterious problem. Everything that can be said about it is curiously unsatisfactory and inadequate, and there is always a danger of the discussion losing itself in pomposity and empty chatter. The very idea of personality is, in common usage, so vague and ill-defined that one hardly ever finds two people who take the word in the same sense. If I put forward a more definite conception of it, I do not imagine that I have uttered the last word. I should like to regard all I say here only as a tentative attempt to approach the problem of personality without making any claim to solve it. Or rather, I should like my attempt to be regarded as a description of the psychological problems raised by personality. All the usual explanations and nostrums of psychology are apt to fall short here, just as they do with the man of genius or the creative artist. Inferences from heredity or from environment do not quite come off; inventing fictions about childhood, so popular today, ends—to put it mildly—in unreality; explanations from necessity—“he had no money,” “he was a sick man,” etc.—remain caught in externals. There is always something irrational to be added, something that simply cannot be explained, a *deus ex machina* or an *asylum ignorantiae*, that well-known sobriquet for God. The problem thus seems to border on the extrahuman realm, which has always been known by a divine name. As you can see, I too have had to refer to the “inner voice,” the vocation, and define it as a powerful objective-psychic factor in order to characterize the way in which it functions in the developing personality and how it appears subjectively. Mephistopheles, in *Faust*, is not personified merely because this creates a better dramatic or theatrical effect, as though Faust were his own moralist and painted his private devil on the wall. The opening words of the Dedication—“Once more you hover near me, forms and faces”—are more than just an aesthetic flourish. Like the concretism of the devil, they are an admission of the objectivity of psychic experience, a whispered avowal that this was what *actually happened*, not because of subjective wishes, or fears, or personal opinions, but somehow quite of itself. Naturally only a numskull thinks of ghosts, but something like a primitive numskull seems to lurk beneath the surface of our reasonable daytime consciousness.

313] Hence the eternal doubt whether what appears to be the objective psyche is really objective, or whether it might not be imagination after all. But then the question at once arises: have I imagined such and such a thing on purpose, or has it been imagined by something in me? It is a similar problem to that of the neurotic who suffers from an imaginary carcinoma. He knows, and has been told a hundred times before, that it is all imagination, and yet he asks me brokenly, “But why do I imagine such a thing? I don’t want to do it!” To which the answer is: the idea of the

carcinoma has imagined itself in him without his knowledge and without his consent. The reason is that a psychic growth, a “proliferation,” is taking place in his unconscious without his being able to make it conscious. In the face of this interior activity he feels afraid. But since he is entirely persuaded that there can be nothing in his own soul that he does not know about, he must relate his fear to a physical carcinoma which he knows does not exist. And if he should still be afraid of it, there are a hundred doctors to convince him that his fear is entirely groundless. The neurosis is thus a defence against the objective, inner activity of the psyche, or an attempt, somewhat dearly paid for, to escape from the inner voice and hence from the vocation. For this “growth” is the objective activity of the psyche, which, independently of conscious volition, is trying to speak to the conscious mind through the inner voice and lead him towards wholeness. Behind the neurotic perversion is concealed his vocation, his destiny: the growth of personality, the full realization of the life-will that is born with the individual. It is the man without *amor fati* who is the neurotic; he, truly, has missed his vocation, and never will he be able to say with Cromwell, “None climbeth so high as he who knoweth not whither his destiny leadeth him.”⁵

314] To the extent that a man is untrue to the law of his being and does not rise to personality, he has failed to realize his life’s meaning. Fortunately, in her kindness and patience, Nature never puts the fatal question as to the meaning of their lives into the mouths of most people. And where no one asks, no one need answer.

315] The neurotic’s fear of carcinoma is therefore justified: it is not imagination, but the consistent expression of a psychic fact that exists in a sphere outside consciousness, beyond the reach of his will and understanding. If he withdrew into the wilderness and listened to his inner life in solitude, he might perhaps hear what the voice has to say. But as a rule the miseducated, civilized human being is quite incapable of perceiving the voice, which is something not guaranteed by the current shibboleths. Primitive people have a far greater capacity in this respect; at least the medicine-men are able, as part of their professional equipment, to talk with spirits, trees, and animals, these being the forms in which they encounter the objective psyche or psychic non-ego.

316] Because neurosis is a developmental disturbance of the personality, we physicians of the soul are compelled by professional necessity to concern ourselves with the problem of personality and the inner voice, however remote it may seem to be. In practical psychotherapy these psychic facts, which are usually so vague and have so often degenerated into empty phrases, emerge from obscurity and take visible shape. Nevertheless, it is extremely rare for this to happen spontaneously as it did with the Old Testament prophets; generally the psychic conditions that have caused the disturbance have to be made conscious with considerable effort. But the contents

that then come to light are wholly in accord with the inner voice and point to a predestined vocation, which, if accepted and assimilated by the conscious mind, conduces to the development of personality.

317] Just as the great personality acts upon society to liberate, to redeem, to transform, and to heal, so the birth of personality in oneself has a therapeutic effect. It is as if a river that had run to waste in sluggish side-streams and marshes suddenly found its way back to its proper bed, or as if a stone lying on a germinating seed were lifted away so that the shoot could begin its natural growth.

318] The inner voice is the voice of a fuller life, of a wider, more comprehensive consciousness. That is why, in mythology, the birth of the hero or the symbolic rebirth coincides with sunrise, for the growth of personality is synonymous with an increase of self-consciousness. For the same reason most heroes are characterized by solar attributes, and the moment of birth of their greater personality is known as illumination.

319] The fear that most people naturally have of the inner voice is not so childish as might be supposed. The contents that rise up and confront a limited consciousness are far from harmless, as is shown by the classic example of the temptation of Christ, or the equally significant Mara episode in the Buddha legend. As a rule, they signify the specific danger to which the person concerned is liable to succumb. What the inner voice whispers to us is generally something negative, if not actually evil. This must be so, first of all because we are usually not as unconscious of our virtues as of our vices, and then because we suffer less from the good than from the bad in us. The inner voice, as I have explained above, makes us conscious of the evil from which the whole community is suffering, whether it be the nation or the whole human race. But it presents this evil in an individual form, so that one might at first suppose it to be only an individual characteristic. The inner voice brings the evil before us in a very tempting and convincing way in order to make us succumb. If we do not partially succumb, nothing of this apparent evil enters into us, and no regeneration or healing can take place. (I say "apparent," though this may sound too optimistic.) If we succumb completely, then the contents expressed by the inner voice act as so many devils, and a catastrophe ensues. But if we can succumb only in part, and if by self-assertion the ego can save itself from being completely swallowed, then it can assimilate the voice, and we realize that the evil was, after all, only a semblance of evil, but in reality a bringer of healing and illumination. In fact, the inner voice is a "Lucifer" in the strictest and most unequivocal sense of the word, and it faces people with ultimate moral decisions without which they can never achieve full consciousness and become personalities. The highest and the lowest, the best and the vilest, the truest and the most deceptive things are often

blended together in the inner voice in the most baffling way, thus opening up in us an abyss of confusion, falsehood, and despair.

320] It is naturally absurd for people to accuse the voice of Nature, the all-sustainer and all-destroyer, of evil. If she appears inveterately evil to us, this is mainly due to the old truth that the good is always the enemy of the better. We would be foolish indeed if we did not cling to the traditional good for as long as possible. But as Faust says:

Whenever in this world we reach the good
We call the better all a lie, a sham!

A good thing is unfortunately not a good forever, for otherwise there would be nothing better. If better is to come, good must stand aside. Therefore Meister Eckhart says, "God is not good, or else he could be better."

321] There are times in the world's history—and our own time may be one of them—when good must stand aside, so that anything destined to be better first appears in evil form. This shows how extremely dangerous it is even to touch these problems, for evil can so easily slip in on the plea that it is, potentially, the better. The problems of the inner voice are full of pitfalls and hidden snares. Treacherous, slippery ground, as dangerous and pathless as life itself once one lets go of the railings. But he who cannot lose his life, neither shall he save it. The hero's birth and the heroic life are always threatened. The serpents sent by Hera to destroy the infant Hercules, the python that tries to strangle Apollo at birth, the massacre of the innocents, all these tell the same story. To develop the personality is a gamble, and the tragedy is that the daemon of the inner voice is at once our greatest danger and an indispensable help. It is tragic, but logical, for it is the nature of things to be so.

322] Can we, therefore, blame humanity, and all the well-meaning shepherds of the flock and worried fathers of families, if they erect protective barriers, hold up wonder-working images, and point out the roads that wind safely past the abyss?

323] But, in the end, the hero, the leader, the saviour, is one who discovers a new way to greater certainty. Everything could be left undisturbed did not the new way demand to be discovered, and did it not visit humanity with all the plagues of Egypt until it finally is discovered. The undiscovered vein within us is a living part of the psyche; classical Chinese philosophy names this interior way "Tao," and likens it to a flow of water that moves irresistibly towards its goal. To rest in Tao means fulfilment, wholeness, one's destination reached, one's mission done; the beginning, end, and perfect realization of the meaning of existence innate in all things. Personality is Tao.

VIII

MARRIAGE AS A PSYCHOLOGICAL RELATIONSHIP

MARRIAGE AS A PSYCHOLOGICAL RELATIONSHIP¹

- 324] Regarded as a psychological relationship, marriage is a highly complex structure made up of a whole series of subjective and objective factors, mostly of a very heterogeneous nature. As I wish to confine myself here to the purely psychological problems of marriage, I must disregard in the main the objective factors of a legal and social nature, although these cannot fail to have a pronounced influence on the psychological relationship between the marriage partners.
- 325] Whenever we speak of a “psychological relationship” we presuppose one that is *conscious*, for there is no such thing as a psychological relationship between two people who are in a state of unconsciousness. From the psychological point of view they would be wholly without relationship. From any other point of view, the physiological for example, they could be regarded as related, but one could not call their relationship psychological. It must be admitted that though such total unconsciousness as I have assumed does not occur, there is nevertheless a not inconsiderable degree of partial unconsciousness, and the psychological relationship is limited in the degree to which that unconsciousness exists.
- 326] In the child, consciousness rises out of the depths of unconscious psychic life, at first like separate islands, which gradually unite to form a “continent,” a continuous land-mass of consciousness. Progressive mental development means, in effect, extension of consciousness. With the rise of a continuous consciousness, and not before, psychological relationship becomes possible. So far as we know, consciousness is always ego-consciousness. In order to be conscious of myself, I must be able to distinguish myself from others. Relationship can only take place where this distinction exists. But although the distinction may be made in a general way, normally it is incomplete, because large areas of psychic life still remain unconscious. As no distinction can be made with regard to unconscious contents, on this terrain no relationship can be established; here there still reigns the original unconscious condition of the ego’s primitive identity with others, in other words a complete absence of relationship.
- 327] The young person of marriageable age does, of course, possess an ego-consciousness (girls more than men, as a rule), but, since he has only recently emerged from the mists of original unconsciousness, he is certain to have wide areas which still lie in the shadow and which preclude to that extent the formation of psychological relationship. This means, in practice, that the young man (or woman) can have only an incomplete understanding of himself and others, and is therefore

imperfectly informed as to his, and their, motives. As a rule the motives he acts from are largely unconscious. Subjectively, of course, he thinks himself very conscious and knowing, for we constantly overestimate the existing content of consciousness, and it is a great and surprising discovery when we find that what we had supposed to be the final peak is nothing but the first step in a very long climb. The greater the area of unconsciousness, the less is marriage a matter of free choice, as is shown subjectively in the fatal compulsion one feels so acutely when one is in love. The compulsion can exist even when one is not in love, though in less agreeable form.

328] Unconscious motivations are of a personal and of a general nature. First of all, there are the motives deriving from parental influence. The relationship of the young man to his mother, and of the girl to her father, is the determining factor in this respect. It is the strength of the bond to the parents that unconsciously influences the choice of husband or wife, either positively or negatively. Conscious love for either parent favours the choice of a like mate, while an unconscious tie (which need not by any means express itself consciously as love) makes the choice difficult and imposes characteristic modifications. In order to understand them, one must know first of all the cause of the unconscious tie to the parents, and under what conditions it forcibly modifies, or even prevents, the conscious choice. Generally speaking, all the life which the parents could have lived, but of which they thwarted themselves for artificial motives, is passed on to the children in substitute form. That is to say, the children are driven unconsciously in a direction that is intended to compensate for everything that was left unfulfilled in the lives of their parents. Hence it is that excessively moral-minded parents have what are called "unmoral" children, or an irresponsible wastrel of a father has a son with a positively morbid amount of ambition, and so on. The worst results flow from parents who have kept themselves artificially unconscious. Take the case of a mother who deliberately keeps herself unconscious so as not to disturb the pretence of a "satisfactory" marriage. Unconsciously she will bind her son to her, more or less as a substitute for a husband. The son, if not forced directly into homosexuality, is compelled to modify his choice in a way that is contrary to his true nature. He may, for instance, marry a girl who is obviously inferior to his mother and therefore unable to compete with her; or he will fall for a woman of a tyrannical and overbearing disposition, who may perhaps succeed in tearing him away from his mother. The choice of a mate, if the instincts have not been vitiated, may remain free from these influences, but sooner or later they will make themselves felt as obstacles. A more or less instinctive choice might be considered the best from the point of view of maintaining the species, but it is not always fortunate psychologically, because there is often an uncommonly large difference between the purely instinctive personality and one that is individually differentiated. And though in such cases the race might

be improved and invigorated by a purely instinctive choice, individual happiness would be bound to suffer. (The idea of “instinct” is of course nothing more than a collective term for all kinds of organic and psychic factors whose nature is for the most part unknown.)

329] If the individual is to be regarded solely as an instrument for maintaining the species, then the purely instinctive choice of a mate is by far the best. But since the foundations of such a choice are unconscious, only a kind of impersonal liaison can be built upon them, such as can be observed to perfection among primitives. If we can speak here of a “relationship” at all, it is, at best, only a pale reflection of what we mean, a very distant state of affairs with a decidedly impersonal character, wholly regulated by traditional customs and prejudices, the prototype of every conventional marriage.

330] So far as reason or calculation or the so-called loving care of the parents does not arrange the marriage, and the pristine instincts of the children are not vitiated either by false education or by the hidden influence of accumulated and neglected parental complexes, the marriage choice will normally follow the unconscious motivations of instinct. Unconsciousness results in non-differentiation, or unconscious identity. The practical consequence of this is that one person presupposes in the other a psychological structure similar to his own. Normal sex life, as a shared experience with apparently similar aims, further strengthens the feeling of unity and identity. This state is described as one of complete harmony, and is extolled as a great happiness (“one heart and one soul”)—not without good reason, since the return to that original condition of unconscious oneness is like a return to childhood. Hence the childish gestures of all lovers. Even more is it a return to the mother’s womb, into the teeming depths of an as yet unconscious creativity. It is, in truth, a genuine and incontestable experience of the Divine, whose transcendent force obliterates and consumes everything individual; a real communion with life and the impersonal power of fate. The individual will for self-possession is broken: the woman becomes the mother, the man the father, and thus both are robbed of their freedom and made instruments of the life urge.

331] Here the relationship remains within the bounds of the biological instinctive goal, the preservation of the species. Since this goal is of a collective nature, the psychological link between husband and wife will also be essentially collective, and cannot be regarded as an individual relationship in the psychological sense. We can only speak of this when the nature of the unconscious motivations has been recognized and the original identity broken down. Seldom or never does a marriage develop into an individual relationship smoothly and without crises. There is no birth of consciousness without pain.

331a] The ways that lead to conscious realization are many, but they follow definite laws. In general, the change begins with the onset of the second half of life. The middle period of life is a time of enormous psychological importance. The child begins its psychological life within very narrow limits, inside the magic circle of the mother and the family. With progressive maturation it widens its horizon and its own sphere of influence; its hopes and intentions are directed to extending the scope of personal power and possessions; desire reaches out to the world in ever-widening range; the will of the individual becomes more and more identical with the natural goals pursued by unconscious motivations. Thus man breathes his own life into things, until finally they begin to live of themselves and to multiply; and imperceptibly he is overgrown by them. Mothers are overtaken by their children, men by their own creations, and what was originally brought into being only with labour and the greatest effort can no longer be held in check. First it was passion, then it became duty, and finally an intolerable burden, a vampire that battens on the life of its creator. Middle life is the moment of greatest unfolding, when a man still gives himself to his work with his whole strength and his whole will. But in this very moment evening is born, and the second half of life begins. Passion now changes her face and is called duty; "I want" becomes the inexorable "I must," and the turnings of the pathway that once brought surprise and discovery become dulled by custom. The wine has fermented and begins to settle and clear. Conservative tendencies develop if all goes well; instead of looking forward one looks backward, most of the time involuntarily, and one begins to take stock, to see how one's life has developed up to this point. The real motivations are sought and real discoveries are made. The critical survey of himself and his fate enables a man to recognize his peculiarities. But these insights do not come to him easily; they are gained only through the severest shocks.

331b] Since the aims of the second half of life are different from those of the first, to linger too long in the youthful attitude produces a division of the will. Consciousness still presses forward, in obedience, as it were, to its own inertia, but the unconscious lags behind, because the strength and inner resolve needed for further expansion have been sapped. This disunity with oneself begets discontent, and since one is not conscious of the real state of things one generally projects the reasons for it upon one's partner. A critical atmosphere thus develops, the necessary prelude to conscious realization. Usually this state does not begin simultaneously for both partners. Even the best of marriages cannot expunge individual differences so completely that the state of mind of the partners is absolutely identical. In most cases one of them will adapt to marriage more quickly than the other. The one who is grounded on a positive relationship to the parents will find little or no difficulty in adjusting to his or her partner, while the other may be hindered by a deep-seated

unconscious tie to the parents. He will therefore achieve complete adaptation only later, and, because it is won with greater difficulty, it may even prove the more durable.

331c] These differences in tempo, and in the degree of spiritual development, are the chief causes of a typical difficulty which makes its appearance at critical moments. In speaking of “the degree of spiritual development” of a personality, I do not wish to imply an especially rich or magnanimous nature. Such is not the case at all. I mean, rather, a certain complexity of mind or nature, comparable to a gem with many facets as opposed to the simple cube. There are many-sided and rather problematical natures burdened with hereditary traits that are sometimes very difficult to reconcile. Adaptation to such natures, or their adaptation to simpler personalities, is always a problem. These people, having a certain tendency to dissociation, generally have the capacity to split off irreconcilable traits of character for considerable periods, thus passing themselves off as much simpler than they are; or it may happen that their many-sidedness, their very versatility, lends them a peculiar charm. Their partners can easily lose themselves in such a labyrinthine nature, finding in it such an abundance of possible experiences that their personal interests are completely absorbed, sometimes in a not very agreeable way, since their sole occupation then consists in tracking the other through all the twists and turns of his character. There is always so much experience available that the simpler personality is surrounded, if not actually swamped, by it; he is swallowed up in his more complex partner and cannot see his way out. It is an almost regular occurrence for a woman to be wholly contained, spiritually, in her husband, and for a husband to be wholly contained, emotionally, in his wife. One could describe this as the problem of the “contained” and the “container.”

332] The one who is contained feels himself to be living entirely within the confines of his marriage; his attitude to the marriage partner is undivided; outside the marriage there exist no essential obligations and no binding interests. The unpleasant side of this otherwise ideal partnership is the disquieting dependence upon a personality that can never be seen in its entirety, and is therefore not altogether credible or dependable. The great advantage lies in his own undividedness, and this is a factor not to be underrated in the psychic economy.

333] The container, on the other hand, who in accordance with his tendency to dissociation has an especial need to unify himself in undivided love for another, will be left far behind in this effort, which is naturally very difficult for him, by the simpler personality. While he is seeking in the latter all the subtleties and complexities that would complement and correspond to his own facets, he is disturbing the other’s simplicity. Since in normal circumstances simplicity always has the advantage over complexity, he will very soon be obliged to abandon his

efforts to arouse subtle and intricate reactions in a simpler nature. And soon enough his partner, who in accordance with her² simpler nature expects simple answers from him, will give him plenty to do by constellating his complexities with her everlasting insistence on simple answers. Willynilly, he must withdraw into himself before the suasions of simplicity. Any mental effort, like the conscious process itself, is so much of a strain for the ordinary man that he invariably prefers the simple, even when it does not happen to be the truth. And when it represents at least a half-truth, then it is all up with him. The simpler nature works on the more complicated like a room that is too small, that does not allow him enough space. The complicated nature, on the other hand, gives the simpler one too many rooms with too much space, so that she never knows where she really belongs. So it comes about quite naturally that the more complicated contains the simpler. The former cannot be absorbed in the latter, but encompasses it without being itself contained. Yet, since the more complicated has perhaps a greater need of being contained than the other, he feels himself outside the marriage and accordingly always plays the problematical role. The more the contained clings, the more the container feels shut out of the relationship. The contained pushes into it by her clinging, and the more she pushes, the less the container is able to respond. He therefore tends to spy out of the window, no doubt unconsciously at first; but with the onset of middle age there awakens in him a more insistent longing for that unity and undividedness which is especially necessary to him on account of his dissociated nature. At this juncture things are apt to occur that bring the conflict to a head. He becomes conscious of the fact that he is seeking completion, seeking the contentedness and undividedness that have always been lacking. For the contained this is only a confirmation of the insecurity she has always felt so painfully; she discovers that in the rooms which apparently belonged to her there dwell other, unwished-for guests. The hope of security vanishes, and this disappointment drives her in on herself, unless by desperate and violent efforts she can succeed in forcing her partner to capitulate, and in extorting a confession that his longing for unity was nothing but a childish or morbid fantasy. If these tactics do not succeed, her acceptance of failure may do her a real good, by forcing her to recognize that the security she was so desperately seeking in the other is to be found in herself. In this way she finds herself and discovers in her own simpler nature all those complexities which the container had sought for in vain.

334] If the container does not break down in face of what we are wont to call “unfaithfulness,” but goes on believing in the inner justification of his longing for unity, he will have to put up with his self-division for the time being. A dissociation is not healed by being split off, but by more complete disintegration. All the powers that strive for unity, all healthy desire for selfhood, will resist the disintegration, and

in this way he will become conscious of the possibility of an inner integration, which before he had always sought outside himself. He will then find his reward in an undivided self.

335] This is what happens very frequently about the midday of life, and in this wise our miraculous human nature enforces the transition that leads from the first half of life to the second. It is a metamorphosis from a state in which man is only a tool of instinctive nature, to another in which he is no longer a tool, but himself: a transformation of nature into culture, of instinct into spirit.

336] One should take great care not to interrupt this necessary development by acts of moral violence, for any attempt to create a spiritual attitude by splitting off and suppressing the instincts is a falsification. Nothing is more repulsive than a furtively prurient spirituality; it is just as unsavoury as gross sensuality. But the transition takes a long time, and the great majority of people get stuck in the first stages. If only we could, like the primitives, leave the unconscious to look after this whole psychological development which marriage entails, these transformations could be worked out more completely and without too much friction. So often among so-called “primitives” one comes across spiritual personalities who immediately inspire respect, as though they were the fully matured products of an undisturbed fate. I speak here from personal experience. But where among present-day Europeans can one find people not deformed by acts of moral violence? We are still barbarous enough to believe both in asceticism and its opposite. But the wheel of history cannot be put back; we can only strive towards an attitude that will allow us to live out our fate as undisturbedly as the primitive pagan in us really wants. Only on this condition can we be sure of not perverting spirituality into sensuality, and vice versa; for both must live, each drawing life from the other.

337] The transformation I have briefly described above is the very essence of the psychological marriage relationship. Much could be said about the illusions that serve the ends of nature and bring about the transformations that are characteristic of middle life. The peculiar harmony that characterizes marriage during the first half of life—provided the adjustment is successful—is largely based on the projection of certain archetypal images, as the critical phase makes clear.

338] Every man carries within him the eternal image of woman, not the image of this or that particular woman, but a definite feminine image. This image is fundamentally unconscious, an hereditary factor of primordial origin engraved in the living organic system of the man, an imprint or “archetype” of all the ancestral experiences of the female, a deposit, as it were, of all the impressions ever made by woman—in short, an inherited system of psychic adaptation. Even if no women existed, it would still be possible, at any given time, to deduce from this unconscious image exactly how a woman would have to be constituted psychically.

The same is true of the woman: she too has her inborn image of man. Actually, we know from experience that it would be more accurate to describe it as an image of *men*, whereas in the case of the man it is rather the image of *woman*. Since this image is unconscious, it is always unconsciously projected upon the person of the beloved, and is one of the chief reasons for passionate attraction or aversion. I have called this image the “anima,” and I find the scholastic question *Habet mulier animam?* especially interesting, since in my view it is an intelligent one inasmuch as the doubt seems justified. Woman has no anima, no soul, but she has an *animus*. The anima has an erotic, emotional character, the animus a rationalizing one. Hence most of what men say about feminine eroticism, and particularly about the emotional life of women, is derived from their own anima projections and distorted accordingly. On the other hand, the astonishing assumptions and fantasies that women make about men come from the activity of the animus, who produces an inexhaustible supply of illogical arguments and false explanations.

339] Anima and animus are both characterized by an extraordinary many-sidedness. In a marriage it is always the contained who projects this image upon the container, while the latter is only partially able to project his unconscious image upon his partner. The more unified and simple this partner is, the less complete the projection. In which case, this highly fascinating image hangs as it were in mid air, as though waiting to be filled out by a living person. There are certain types of women who seem to be made by nature to attract anima projections; indeed one could almost speak of a definite “anima type.” The so-called “sphinx-like” character is an indispensable part of their equipment, also an equivocalness, an intriguing elusiveness—not an indefinite blur that offers nothing, but an indefiniteness that seems full of promises, like the speaking silence of a Mona Lisa. A woman of this kind is both old and young, mother and daughter, of more than doubtful chastity, childlike, and yet endowed with a naïve cunning that is extremely disarming to men.³ Not every man of real intellectual power can be an animus, for the animus must be a master not so much of fine ideas as of fine words—words seemingly full of meaning which purport to leave a great deal unsaid. He must also belong to the “misunderstood” class, or be in some way at odds with his environment, so that the idea of self-sacrifice can insinuate itself. He must be a rather questionable hero, a man with possibilities, which is not to say that an animus projection may not discover a real hero long before he has become perceptible to the sluggish wits of the man of “average intelligence.”⁴

340] For man as well as for woman, in so far as they are “containers,” the filling out of this image is an experience fraught with consequences, for it holds the possibility of finding one’s own complexities answered by a corresponding diversity. Wide vistas seem to open up in which one feels oneself embraced and contained. I say “seem”

advisedly, because the experience may be two-faced. Just as the animus projection of a woman can often pick on a man of real significance who is not recognized by the mass, and can actually help him to achieve his true destiny with her moral support, so a man can create for himself a *femme inspiratrice* by his anima projection. But more often it turns out to be an illusion with destructive consequences, a failure because his faith was not sufficiently strong. To the pessimists I would say that these primordial psychic images have an extraordinarily positive value, but I must warn the optimists against blinding fantasies and the likelihood of the most absurd aberrations.

341] One should on no account take this projection for an individual and conscious relationship. In its first stages it is far from that, for it creates a compulsive dependence based on unconscious motives other than the biological ones. Rider Haggard's *She* gives some indication of the curious world of ideas that underlies the anima projection. They are in essence spiritual contents, often in erotic disguise, obvious fragments of a primitive mythological mentality that consists of archetypes, and whose totality constitutes the collective unconscious. Accordingly, such a relationship is at bottom collective and not individual. (Benoît, who created in *L'Atlantide* a fantasy figure similar even in details to "She," denies having plagiarized Rider Haggard.)

342] If such a projection fastens on to one of the marriage partners, a collective spiritual relationship conflicts with the collective biological one and produces in the container the division or disintegration I have described above. If he is able to hold his head above water, he will find himself through this very conflict. In that case the projection, though dangerous in itself, will have helped him to pass from a collective to an individual relationship. This amounts to full conscious realization of the relationship that marriage brings. Since the aim of this paper is a discussion of the psychology of marriage, the psychology of projection cannot concern us here. It is sufficient to mention it as a fact.

343] One can hardly deal with the psychological marriage relationship without mentioning, even at the risk of misunderstanding, the nature of its critical transitions. As is well known, one understands nothing psychological unless one has experienced it oneself. Not that this ever prevents anyone from feeling convinced that his own judgment is the only true and competent one. This disconcerting fact comes from the necessary overvaluation of the momentary content of consciousness, for without this concentration of attention one could not be conscious at all. Thus it is that every period of life has its own psychological truth, and the same applies to every stage of psychological development. There are even stages which only the few can reach, it being a question of race, family, education, talent, and passion. Nature is aristocratic. The normal man is a fiction, although certain generally valid laws do

exist. Psychic life is a development that can easily be arrested on the lowest levels. It is as though every individual had a specific gravity, in accordance with which he either rises, or sinks down, to the level where he reaches his limit. His views and convictions will be determined accordingly. No wonder, then, that by far the greater number of marriages reach their upper psychological limit in fulfilment of the biological aim, without injury to spiritual or moral health. Relatively few people fall into deeper disharmony with themselves. Where there is a great deal of pressure from outside, the conflict is unable to develop much dramatic tension for sheer lack of energy. Psychological insecurity, however, increases in proportion to social security, unconsciously at first, causing neuroses, then consciously, bringing with it separations, discord, divorces, and other marital disorders. On still higher levels, new possibilities of psychological development are discerned, touching on the sphere of religion where critical judgment comes to a halt.

344] Progress may be permanently arrested on any of these levels, with complete unconsciousness of what might have followed at the next stage of development. As a rule graduation to the next stage is barred by violent prejudices and superstitious fears. This, however, serves a most useful purpose, since a man who is compelled by accident to live at a level too high for him becomes a fool and a menace.

345] Nature is not only aristocratic, she is also esoteric. Yet no man of understanding will thereby be induced to make a secret of what he knows, for he realizes only too well that the secret of psychic development can never be betrayed, simply because that development is a question of individual capacity.

CASES IN SUMMARY (in order of presentation, numbered for reference):

[1] Anna, aged 3, subject of “Psychic Conflicts in a Child.” — [9-35](#)

[2] Girl, aged 15, who harboured an unconscious fantasy of mother’s death. — [11](#)

[3] Boy, who dreamed the erotic and religious problems of father (ref.). - [53](#)

[4] Three sisters, who dreamed of “devoted” mother as animal, she later going insane. — [55](#)

[5] Mountain-climber, man of 50, whose dreams presaged a fatal climbing expedition. — [60f](#)

[6] Boy, aged 6, imbecile, whose fits of rage were caused by his mother’s ambition. — [69f](#)

[7] Boy, aged 14, who killed his stepfather. — [70](#)

[8] Boy, who at 5 violated his sister, later tried to kill father, and grew up to be normal. — [70f](#)

[9] Boy, aged 7, epileptic, whose first symptom was truancy. — [71f](#)

[10] Boy, aged 14, schizophrenic, whose first symptom was a sexual conflict. — [73](#)

[11] Girl, aged 4, whose psychogenic constipation was caused by her mother. — [73f](#)

[12] Four abnormal siblings, all infected by un-lived erotic life of mother, who subsequently became melancholic. — [76ff](#)

[13] Recruit, aged 19, hysterical, cured by anamnestic analysis. — [95f](#)

[14] Recruit, neurotic, cured by anamnestic analysis. — [96](#)

[15] Man, aged 30, who was “kept” by older woman, and whose “psychoanalytical autobiography” omitted essential moral element. — [98f](#)

- [16] Widow, aged 54, whose “snapshot” dreams contained her real intentions. — [100f](#)
- [17] Crusty old general, whose dream showed an undeveloped interest in art. — [102f](#)
- [18] Cryptomnestic case concerning Nietzsche, in “Psychology and Pathology of So-called Occult Phenomena” (ref.). — [110](#)
- [19] Young theological student, with religious problem, who dreamt of black and white magicians. — [117ff](#)
- [20] Boy, aged 7, supposedly mental defective, with many symptoms, treated by explanation of his condition to his parents and later by individual treatment; he developed a moral imaginary companion in Santa Claus. — [121f](#)
- [21] Girl, aged 9, with subnormal temperature, who improved when her parents faced their conflict. — [123f](#)
- [22] Girl, aged 13, whose antisocial attitude was caused by her intellectually ambitious mother. — [126f](#)
- [23] Margaret, aged 8, with birth injury, who during treatment developed an imaginary companion called Anna. — [128ff](#)
- [24] Medium, girl aged 16, subject of “The Psychology and Pathology of So-called Occult Phenomena” (ref.). — [131](#)
- [25] Little boy, imbecile, whose condition was not accepted by his mother. — [132](#)
- [26] Little girl, intelligent, whose difficulties stemmed from being pupil of teacher trained to work with mentally defective children. — [137](#)
- [27] “Misunderstood genius”: “lazy hound.” — [143](#)
- [28] Homosexual youth, aged 20, whose religious dreams compensated the negative view of his condition and indicated the initiatory character of his symptom. — [156ff](#)

THE COLLECTED WORKS OF

C. G. JUNG

*THE PUBLICATION of the first complete edition, in English, of the works of C. G. Jung was undertaken by Routledge and Kegan Paul, Ltd., in England and by Bollingen Foundation in the United States. The American edition is number XX in Bollingen Series, which since 1967 has been published by Princeton University Press. The edition contains revised versions of works previously published, such as *Psychology of the Unconscious*, which is now entitled *Symbols of Transformation*; works originally written in English, such as *Psychology and Religion*; works not previously translated, such as *Aion*; and, in general, new translations of virtually all of Professor Jung's writings. Prior to his death, in 1961, the author supervised the textual revision, which in some cases is extensive. Sir Herbert Read (d. 1968), Dr. Michael Fordham, and Dr. Gerhard Adler compose the Editorial Committee; the translator is R. F. C. Hull (except for Volume 2) and William McGuire is executive editor.*

The price of the volumes varies according to size; they are sold separately, and may also be obtained on standing order. Several of the volumes are extensively illustrated. Each volume contains an index and in *most* a bibliography; the final volumes will contain a complete bibliography of Professor Jung's writings and a general index to the entire edition.

In the following list, dates of original publication are given in parentheses (of original composition, in brackets). Multiple dates indicate revisions.

•1. PSYCHIATRIC STUDIES

On the Psychology and Pathology of So-Called Occult Phenomena (1902)

On Hysterical Misreading (1904)

Cryptomnesia (1905)

On Manic Mood Disorder (1903)

A Case of Hysterical Stupor in a Prisoner in Detention (1902)

On Simulated Insanity (1903)

A Medical Opinion on a Case of Simulated Insanity (1904)

A Third and Final Opinion on Two Contradictory Psychiatric Diagnoses (1906)

On the Psychological Diagnosis of Facts (1905)

†2. EXPERIMENTAL RESEARCHES

Translated by Leopold Stein in collaboration with Diana Riviere

STUDIES IN WORD ASSOCIATION (1904–7, 1910)

The Associations of Normal Subjects (by Jung and F. Riklin)

An Analysis of the Associations of an Epileptic

The Reaction-Time Ratio in the Association Experiment

Experimental Observations on the Faculty of Memory

Psychoanalysis and Association Experiments

The Psychological Diagnosis of Evidence

Association, Dream, and' Hysterical Symptom

The Psychopathological Significance of the Association Experiment

Disturbances in Reproduction in the Association Experiment

The Association Method

The Family Constellation

PSYCHOPHYSICAL RESEARCHES (1907–8)

On the Psychophysical Relations of the Association Experiment

Psychophysical Investigations with the Galvanometer and Pneumograph in Normal and Insane Individuals (by F. Peterson and Jung)

Further Investigations on the Galvanic Phenomenon and Respiration in Normal and Insane Individuals (by C. Ricksher and Jung)

Appendix: Statistical Details of Enlistment (1906); New Aspects of Criminal Psychology (1908); The Psychological Methods of Investigation Used in the Psychiatric Clinic of the University of Zurich (1910); On the Doctrine of Complexes ([1911] 1913); On the Psychological Diagnosis of Evidence (1937)

•3. THE PSYCHOGENESIS OF MENTAL DISEASE

The Psychology of Dementia Praecox (1907)

The Content of the Psychoses (1908/1914)

On Psychological Understanding (1914)

A Criticism of Bleuler's Theory of Schizophrenic Negativism (1911)

On the Importance of the Unconscious in Psychopathology (1914)

On the Problem of Psychogenesis in Mental Disease (1919)

Mental Disease and the Psyche (1928)

On the Psychogenesis of Schizophrenia (1939)

Recent Thoughts on Schizophrenia (1957)

Schizophrenia (1958)

† 4. FREUD AND PSYCHOANALYSIS

Freud's Theory of Hysteria: A Reply to Aschaffenburg (1906)

The Freudian Theory of Hysteria (1908)

The Analysis of Dreams (1909)

A Contribution to the Psychology of Rumour (1910–11)

On the Significance of Number Dreams (1910–11)

Morton Prince, "The Mechanism and Interpretation of Dreams": A Critical Review (1911)

On the Criticism of Psychoanalysis (1910)

Concerning Psychoanalysis (1912)

The Theory of Psychoanalysis (1913)

General Aspects of Psychoanalysis (1913)

Psychoanalysis and Neurosis (1916)

Some Crucial Points in Psychoanalysis: A Correspondence between Dr. Jung and Dr. Loÿ (1914)

Prefaces to "Collected Papers on Analytical Psychology" (1916, 1917)

The Significance of the Father in the Destiny of the Individual (1909/1949)

Introduction to Kranefeldt's "Secret Ways of the Mind" (1930)

Freud and Jung: Contrasts (1929)

‡ 5. SYMBOLS OF TRANSFORMATION (1911–12/1952)

PART I

Introduction

Two Kinds of Thinking

The Miller Fantasies: Anamnesis

The Hymn of Creation

The Song of the Moth

PART II

Introduction

The Concept of Libido

The Transformation of Libido

The Origin of the Hero
Symbols of the Mother and of Rebirth
The Battle for Deliverance from the Mother
The Dual Mother
The Sacrifice
Epilogue
Appendix: The Miller Fantasies

• **6. PSYCHOLOGICAL TYPES (1921)**

Introduction
The Problem of Types in the History of Classical and Medieval Thought
Schiller's Ideas on the Type Problem
The Apollinian and the Dionysian
The Type Problem in Human Character
The Type Problem in Poetry
The Type Problem in Psychopathology
The Type Problem in Aesthetics
The Type Problem in Modern Philosophy
The Type Problem in Biography
General Description of the Types
Definitions
Epilogue
Four Papers on Psychological Typology (1913, 1925, 1931, 1936)

† **7. TWO ESSAYS ON ANALYTICAL PSYCHOLOGY**

On the Psychology of the Unconscious (1917/1926/1943)
The Relations between the Ego and the Unconscious (1928)
Appendix: New Paths in Psychology (1912); The Structure of the Unconscious
(1916) (new versions, with variants, 1966)

‡ **8. THE STRUCTURE AND DYNAMICS OF THE PSYCHE**

On Psychic Energy (1928)
The Transcendent Function ([1916]/1957)
A Review of the Complex Theory (1934)
The Significance of Constitution and Heredity in Psychology (1929)

Psychological Factors Determining Human Behavior (1937)
Instinct and the Unconscious (1919)
The Structure of the Psyche (1927/1931)
On the Nature of the Psyche (1947/1954)
General Aspects of Dream Psychology (1916/1948)
On the Nature of Dreams (1945/1948)
The Psychological Foundations of Belief in Spirits (1920/1948)
Spirit and Life (1926)
Basic Postulates of Analytical Psychology (1931)
Analytical Psychology and *Weltanschauung* (1928/1931)
The Real and the Surreal (1933)
The Stages of Life (1930–1931)
The Soul and Death (1934)
Synchronicity: An Acausal Connecting Principle (1952)
Appendix: On Synchronicity (1951)

• **9. PART I. THE ARCHETYPES AND THE COLLECTIVE UNCONSCIOUS**

Archetypes of the Collective Unconscious (1934/1954)
The Concept of the Collective Unconscious (1936)
Concerning the Archetypes, with Special Reference to the Anima Concept
(1936/1954)
Psychological Aspects of the Mother Archetype (1938/1954)
Concerning Rebirth (1940/1950)
The Psychology of the Child Archetype (1940)
The Psychological Aspects of the Kore (1941)
The Phenomenology of the Spirit in Fairytales (1945/1948)
On the Psychology of the Trickster-Figure (1954)
Conscious, Unconscious, and Individuation (1939)
A Study in the Process of Individuation (1934/1950)
Concerning Mandala Symbolism (1950)
Appendix: Mandalas (1955)

• **9. PART II. AION (1951)**

RESEARCHES INTO THE PHENOMENOLOGY OF THE SELF

The Ego

The Shadow

The Syzygy: Anima and Animus

The Self

Christ, a Symbol of the Self

The Sign of the Fishes

The Prophecies of Nostradamus

The Historical Significance of the Fish

The Ambivalence of the Fish Symbol

The Fish in Alchemy

The Alchemical Interpretation of the Fish

Background to the Psychology of Christian Alchemical Symbolism

Gnostic Symbols of the Self

The Structure and Dynamics of the Self

Conclusion

• 10. CIVILIZATION IN TRANSITION

The Role of the Unconscious (1918)

Mind and Earth (1927/1931)

Archaic Man (1931)

The Spiritual Problem of Modern Man (1928/1931)

The Love Problem of a Student (1928)

Woman in Europe (1927)

The Meaning of Psychology for Modern Man (1933/1934)

The State of Psychotherapy Today (1934)

Preface and Epilogue to “Essays on Contemporary Events” (1946)

Wotan (1936)

After the Catastrophe (1945)

The Fight with the Shadow (1946)

The Undiscovered Self (Present and Future) (1957)

Flying Saucers: A Modern Myth (1958)

A Psychological View of Conscience (1958)

Good and Evil in Analytical Psychology (1959)

Introduction to Wolff’s “Studies in Jungian Psychology” (1959)

The Swiss Line in the European Spectrum (1928)

Reviews of Keyserling’s “America Set Free” (1930) and “La Révolution
Mondiale” (1934)

The Complications of American Psychology (1930)

The Dreamlike World of India (1939)

What India Can Teach Us (1939)

Appendix: Documents (1933–1938)

†11. PSYCHOLOGY AND RELIGION: WEST AND EAST

WESTERN RELIGION

Psychology and Religion (The Terry Lectures) (1938/1940)

A Psychological Approach to the Dogma of the Trinity (1942/1948)

Transformation Symbolism in the Mass (1942/1954)

Forewords to White's "God and the Unconscious" and Werblowsky's "Lucifer and Prometheus" (1952)

Brother Klaus (1933)

Psychotherapists or the Clergy (1932)

Psychoanalysis and the Cure of Souls (1928)

Answer to Job (1952)

EASTERN RELIGION

Psychological Commentaries on "The Tibetan Book of the Great Liberation" (1939/1954) and "The Tibetan Book of the Dead" (1935/1953)

Yoga and the West (1936)

Foreword to Suzuki's "Introduction to Zen Buddhism" (1939)

The Psychology of Eastern Meditation (1943)

The Holy Men of India: Introduction to Zimmer's "Der Weg zum Selbst" (1944)

Foreword to the "I Ching" (1950)

•12. PSYCHOLOGY AND ALCHEMY (1944)

Prefatory note to the English Edition ([1951?] added 1967)

Introduction to the Religious and Psychological Problems of Alchemy

Individual Dream Symbolism in Relation to Alchemy (1936)

Religious Ideas in Alchemy (1937)

Epilogue

†13. ALCHEMICAL STUDIES

Commentary on "The Secret of the Golden Flower" (1929)

The Visions of Zosimos (1938/1954)

Paracelsus as a Spiritual Phenomenon (1942)

The Spirit Mercurius (1943/1948)

The Philosophical Tree (1945/1954)

‡14. MYSTERIUM CONIUNCTIONIS (1955–56)

AN INQUIRY INTO THE SEPARATION AND
SYNTHESIS OF PSYCHIC OPPOSITES IN ALCHEMY

The Components of the Coniunctio

The Paradoxa

The Personification of the Opposites

Rex and Regina

Adam and Eve

The Conjunction

●15. THE SPIRIT IN MAN, ART, AND LITERATURE

Paracelsus (1929)

Paracelsus the Physician (1941)

Sigmund Freud in His Historical Setting (1932)

In Memory of Sigmund Freud (1939)

Richard Wilhelm; In Memoriam (1930)

On the Relation of Analytical Psychology to Poetry (1922)

Psychology and Literature (1930/1950)

“Ulysses”: A Monologue (1932)

Picasso (1932)

‡16. THE PRACTICE OF PSYCHOTHERAPY

GENERAL PROBLEMS OF PSYCHOTHERAPY

Principles of Practical Psychotherapy (1935)

What Is Psychotherapy? (1935)

Some Aspects of Modern Psychotherapy (1930)

The Aims of Psychotherapy (1931)

Problems of Modern Psychotherapy (1929)

Psychotherapy and a Philosophy of Life (1943)

Medicine and Psychotherapy (1945)

Psychotherapy Today (1945)

Fundamental Questions of Psychotherapy (1951)

SPECIFIC PROBLEMS OF PSYCHOTHERAPY

The Therapeutic Value of Abreaction (1921/1928)

The Practical Use of Dream-Analysis (1934)

The Psychology of the Transference (1946)

Appendix: The Realities of Practical Psychotherapy ([1937] added, 1966)

‡17. THE DEVELOPMENT OF PERSONALITY

Psychic Conflicts in a Child (1910/1946)

Introduction to Wickes's "Analyses der Kinderseele" (1927/1931)

Child Development and Education (1928)

Analytical Psychology and Education: Three Lectures (1926/1946)

The Gifted Child (1943)

The Significance of the Unconscious in Individual Education (1928)

The Development of Personality (1934)

Marriage as a Psychological Relationship (1925)

•18. THE SYMBOLIC LIFE

Miscellaneous Writings

†19. GENERAL BIBLIOGRAPHY OF C. G. JUNG'S WRITINGS

†20. GENERAL INDEX TO THE COLLECTED WORKS

See also:

C. G. JUNG: LETTERS

Selected and edited by Gerhard Adler, in collaboration with Aniela Jaffé. Translations from the German by R.F.C. Hull.

VOL. 1: 1906–1950

VOL. 2: 1951–1961

THE FREUD/JUNG LETTERS

Edited by William McGuire, translated by

Ralph Manheim and R.F.C. Hull

C. G. JUNG SPEAKING: Interviews and Encounters

Edited by William McGuire and R.F.C. Hull

C. G. JUNG: Word and Image

Edited by Aniela Jaffé

¹ “Analysis of a Phobia in a Five-year-old Boy,” *Standard Edition of the Complete Psychological Works of Sigmund Freud*, X (1955; first pub. 1909).

² [In the light of Professor Jung’s later researches these theories can be understood as based upon the archetype of rebirth, in the unconscious. Several other examples of archetypal activity are to be found in this essay.—EDITORS.]

³ One might ask at this point why one is justified in supposing at all that children of this age worry their heads about such theories. The answer is that children are intensely interested in all the sensuously perceptible things going on around them. This also shows itself in the well-known endless questions concerning the why and wherefore of everything. One has to put off the dun-coloured spectacles of our culture for a moment if one wants to understand the psychology of a child. For everybody the birth of a child is quite the most important event there can possibly be. For our civilized thinking, however, birth has lost much of its biological uniqueness, just as sex has done. But somewhere or other the mind must have stored up the correct biological valuations impressed upon it all through the ages. What could be more probable than that the child still has these valuations and makes no bones about showing them, before civilization spreads like a pall over his primitive thinking?

⁴ This process is altogether typical. When life comes up against an obstacle, so that no adaptation can be achieved and the transference of libido to reality is suspended, then an introversion takes place. That is to say, instead of the libido working towards reality there is an increased fantasy activity which aims at removing the obstacle, or at least removing it in fantasy, and this may in time lead to a practical solution. Hence the exaggerated sexual fantasies of neurotics, who in this way try to overcome their specific repression; hence also the typical fantasy of stammerers, that they really possess a great talent for eloquence. (That they have some claims in this respect is brought home to us by Alfred Adler’s thoughtful studies on organ inferiority.)

⁵ The somewhat paradoxical view that the aim of the child’s question is to be sought in the mother’s answer requires a little discussion. It is one of the greatest of Freud’s services to psychology that he opened up again the whole questionableness of *conscious* motives. One consequence of repressing the instincts is that the importance of conscious thinking for action is boundlessly overestimated. According to Freud, the criterion for the psychology of the act is not the conscious motive, but the *result* of the act (the result being evaluated not physically but psychologically). This view sets the act in a new and biologically revealing light. I refrain from examples and shall content myself with observing that this view is extremely valuable for psychoanalysis both in principle and as regards interpretation.

⁶ [In *Coll. Works*, Vol. 3: *The Psychogenesis of Mental Disease*. For the complete contents of the *Collected Works of C. G. Jung*, see the list at the end of this volume.—EDITORS.]

⁷ This is a primitive definition of God.

⁸ Cf, Franz Riklin, *Wishfulfillment and Symbolism in Fairy Tales* (trans. by W. A. White, Nervous and Mental Disease Monograph Series, No. 21, New York, 1915).

⁹ This tendency to get rid of the mother also showed itself in the following incident: The children had requisitioned the tool-shed as a house for themselves and their dolls. An important room in any house is, as we know, the toilet, which obviously cannot be lacking. Accordingly, the children went to the toilet in a corner of the tool-shed. Their

mother naturally could not help spoiling this illusion by forbidding such games. Soon afterwards she caught the remark, “When Mama is dead we’ll do it every day in the tool-shed and put on Sunday clothes every day.”

¹⁰ [Cf. Bronislaw Malinowski, *The Sexual Life of Savages* (3rd edn., London and New York, 1932).—EDITORS.]

¹ [The first three and a half paragraphs originally appeared as an introduction to Frances G. Wickes, *The Inner World of Childhood* (New York, 1927). The book was subsequently translated into German as *Analyse der Kinderseele* (Stuttgart, 1931), and for it Professor Jung expanded his introduction to the present dimensions. It is here translated entirely anew.

Mrs. Wickes (1875–1967) was for many years a school psychologist. She collected numerous case studies, and these were later illuminated for her when she encountered Professor Jung's theories, which she was able to confirm and extend. The most important part of her thesis demonstrates how the unconscious of parents can cause many psychic disorders of childhood.—EDITORS.]

¹ [This lecture was delivered at the International Congress of Education, in Territet (near Montreux) in 1923, and was published in *Contributions to Analytical Psychology* (London and New York, 1928) as the first of four lectures on “Analytical Psychology and Education,” the others being those which follow in the present volume. It was never published in German, but a translation of the original manuscript was made for that volume by H. G. and C. F. Baynes. The present text has been somewhat revised by the author, but is in the main identical with the Baynes version, upon which it is based.—EDITORS.]

² [Professor Jung’s position with regard to infantile sexuality is made clear in the first paper in this volume, “Psychic Conflicts in a Child,” and elsewhere in his writings.—EDITORS.]

³ [Attempts to persuade Professor Jung to write further about his collection of children’s dreams proved unavailing, owing to the pressure upon him of other work. He delivered, however, four series of seminars on the subject between 1935 and 1940, at the Eidgenössische Technische Hochschule, Zurich. The last three were reported by members of the seminars and the transcripts have been privately circulated. Only the third series (winter term, 1938–39) has been translated into English, likewise for private circulation.—EDITORS.]

⁴ I have given elsewhere a number of examples of the extraordinary kinship which exists in the psychological *habitus* of members of the same family, amounting in one case almost to identity. See “The Association Method,” Lecture 2, in *Coll. Works, Vol. 2*.

⁵ [This case is also discussed in “The Practical Use of Dream Analysis,” *Coll. Works, Vol. 16*, pars. 323f., where further details will be found.—EDITORS.]

LECTURE ONE

¹ Freud also translated Hippolyte Bernheim's work into German, under the title *Die Suggestion und ihre Heilwirkung* (Leipzig and Vienna, 1888).

² Cf. my dissertation, "On the Psychology and Pathology of So-called Occult Phenomena," *Coll. Works*, Vol. I.

³ [See *Standard Edition of the Complete Psychological Works of Sigmund Freud*, IX (1959) and X (1955).—EDITORS.]

⁴ The results of my own experiments and those of my fellow workers are set forth in *Studies in Word Association*, trans. by M. D. Eder (London, 1918; New York, 1919). [For Jung's contributions, see *Coll. Works*, Vol. 2.—EDITORS.]

⁵ The so-called "complex theory" found its application in the psychopathology of schizophrenia (Cf. my *The Psychology of Dementia Praecox*, *Coll. Works*, Vol. 3). An account of the same appears in "A Review of the Complex Theory," *Coll. Works*, Vol. 8.

⁶ It is interesting to see how the subliminally existing murder which was seeking to attach itself to the patient in later life (bearded man) is compensated by the disease (the nurse), as if the disease were protecting him against the crime.

⁷ Cf. my "The Psychological Aspects of the Mother Archetype," *Coll. Works*, Vol. 9, pt. 1, and "Mind and Earth," *Coll. Works*, Vol. 10.

⁸ [Christoph Blumhardt (1842–1919), eminent Swiss theologian and Social Democrat.—EDITORS.]

LECTURE TWO

¹ Or, to quote the words of a philosopher: “Before supper I am a Kantian, after supper a Nietzschean.”

² A very promising beginning has been made in the excellent work of Walter H. von Wyss: *Psychophysiologische Probleme in der Medizin* (Basel, 1944).

³ [Professor Jung elaborates this theme in “Sigmund Freud in His Historical Setting,” *Coll. Works*, Vol. 15—EDITORS.]

⁴ Where this fails to work it is put down to the patient’s “resistances.”

⁵ I am indebted to Professor Markus Fierz, of Basel, for this formulation,

⁶ Cf. C. A. Meier’s conspectus of the relevant literature, up to 1935, under “Moderne Physik—Moderne Psychologie,” in *Die kulturelle Bedeutung der komplexen Psychologie* (Berlin, 1935), pp. 34Qff. I would refer the reader particularly to the extensive quotations from articles by Niels Bohr, *Naturwissenschaft*, XVI (1928), 245, and XVII (1929), 483. Since the latter date see particularly Pascual Jordan, *Die Physik des 20. Jahrhunderts* (Brunswick, 1936), also his “Positivische Bemerkungen über die parapsychischen Erscheinungen,” *Zentralblatt für Psychotherapie*, IX (1936), 3ff.; *Anschauliche Quantentheorie* (Berlin, 1936), pp. 271ff.; *Die Physik und das Geheimnis des organischen Lebens* (Brunswick, 1941), pp. 114ff.

⁷ Cf. my essay “Spirit and Life,” *Coll. Works*, Vol. 8.

⁸ Cf. Toni Wolff, “Einführung in die Grundlagen der komplexen Psychologie,” Ch. I, *Die kulturelle Bedeutung der komplexen Psychologie*.

⁹ There are only pale reflections of this word in French and English, such as “idée,” “idea,” “sudden idea,” etc. The German “witzige Einfall” fares a little better as “saillie” or “sally of wit” (from *saillir*, “to rush forth”).

¹⁰ Carl du Prel, *Das Rätsel des Menschen* (Leipzig, 1892), pp. 27ff.

¹¹ Cf. *Studies in Word Association*, *Coll. Works*, Vol. 2; and “A Review of the Complex Theory,” *Coll. Works*, Vol. 8.

¹² Cf. the classic work of Breuer and Freud, *Studies on Hysteria* (1893–95).

¹³ Cf. my *Symbols of Transformation*, *Coll. Works*, Vol. 5; “The Psychology of the Child Archetype” and “The Psychological Aspects of the Kore,” *Coll. Works*, Vol. 9, pt. i.

¹⁴ Cf. my “Individual Dream Symbolism in Relation to Alchemy,” in *Psychology and Alchemy*, *Coll. Works*, Vol. 12.

¹⁵ Cf. my “Archetypes of the Collective Unconscious,” *Coll. Works*, Vol. 9, pt. i.

LECTURE THREE

¹ *Coll. Works, Vol. 1.*

² [Cf. Freud's *Civilization and Its Discontents, Standard Edition of the Complete Psychological Works of Sigmund Freud*, XXI (1961; first pub. 1930).—EDITORS.]

³ Cf. the above-mentioned case (pars. 182f.) of a young man who sunned himself on the Riviera and in the Engadine.

^{3^a} [Cf. Jung, "Paracelsus as a Spiritual Phenomenon," *Coll. Works*, Vol. 13; and Jolande Jacobi, ed., *Paracelsus; Selected Writings* (New York [Bollingen Series XXVII] and London, 2nd edn., 1958), p. 39.—EDITORS.]

⁴ Called "gana loss" in South America. [Spanish, gana = lit., "appetite," "desire." See Count Hermann Keyserling, *South-American Meditations*, trans. by Theresa Duerr (New York and London, 1932), pp. 158ff., on this usage in Buenos Aires.—EDITORS.]

^{4^a} [This case is also discussed in *Two Essays on Analytical Psychology, Coll. Works*, Vol. 7, par. 287.—EDITORS.]

⁵ I do not wish to give offence to the dreamer of the dream under discussion, whom I do not know personally; but I hardly think that a young man of twenty-two would be conscious of the problem broached by this dream, at least, not of its full extent.

⁶ This is not to be identified with ignorance. In order to get at an infantile neurosis or a difficult child, sound knowledge is needed as well as all the other things.

⁷ Well known as the author of *The Inner World of Childhood* (New York and London, 1927), and of *The Inner World of Man* (New York, London, and Toronto, 1938; 2nd edn., 1948). I should like to recommend the first book in particular to parents and teachers. [See the second paper in this volume, an introduction to the German edition.—EDITORS.]

⁸ This is the manifestation of an archetype, namely that of the deadly, devouring mother. Cf. the fairytales of Red Riding Hood and of Hansel and Gretel, and the South Sea myth of Maui and Hine-nui-te-po, the tribal ancestress who sleeps with her mouth open. Maui creeps into the mouth and is swallowed (Leo Frobenius, *Das Zeitalter des Sonnengottes*, Berlin, 1904, I, pp. 66ff.).

⁹ Cf. the snake symbolism in *Symbols of Transformation, Coll. Works*, Vol. 5.

¹⁰ Superficially this dream can be understood as a wish-fulfilment, but closer examination would show that it sums up the facts. For the daughter the mother signifies the feminine instinctual ground-layer which in this case is profoundly disturbed.

¹ [This was first delivered at the annual meeting of the Basel School Council, in December, 1942. It was published as “Der Begabte” in the *Schweizer Erziehungs Rundschau*, XVI (1943): 1, and in *Psychologie und Erziehung* (Zurich, 1946), from which the present translation is made.—EDITORS.]

² [By and large, children in Switzerland are taught in classes composed of pupils belonging to the same age group. There is no attempt to separate them according to their ability as is usual in Great Britain.—EDITORS.]

¹ [Originally delivered as a lecture at the International Congress of Education, Heidelberg, 1925, and subsequently translated by C. F. and H. G. Baynes in *Contributions to Analytical Psychology* (London and New York, 1928). The present translation is newly made from the original manuscript, though the earlier English version has been freely consulted.—EDITORS.]

² [This case is also discussed in *Two Essays on Analytical Psychology, Coll. Works*, Vol. 7, pars. 167ff.—EDITORS.]

¹ [First delivered as a lecture entitled “Die Stimme des Innern” at the Kulturbund, Vienna, in November, 1932. Subsequently published under the title “Vom Werden der Persönlichkeit” in *Wirklichkeit der Seele* (Zurich, Leipzig, and Stuttgart, 1934), and translated into English by Stanley M. Dell as the final chapter of *The Integration of the Personality* (New York, 1939, and London, 1940). The present new translation is made from *Wirklichkeit der Seele*, though the earlier English version has been freely consulted.—EDITORS.]

² *Westästlicher Diwan*, Suleikabuch.

³ Since this sentence was written, Germany too has found her Führer.

⁴ [Cf. C. Kerényi, “The Primordial Child in Primordial Times,” and Jung, “The Psychology of the Child-Archetype,” in *Essays on a Science of Mythology* (Bollingen Series XXII, N. Y. 1949; Princeton/Bollingen Paperback edn., revised, 1969; British edn.: *Introduction to a Science of Mythology*, London, 1950).—EDITORS.]

⁵ [In the German, attributed to Nietzsche.—EDITORS.]

¹ [First published as “Die Ehe als psychologische Beziehung,” in *Das Ehebuch* (Celle, 1925), a volume edited by Count Hermann Keyserling; translated by Theresa Duerr in the English version, *The Book of Marriage* (New York, 1926). The original was reprinted in *Seelenprobleme der Gegenwart* (Zurich, 1931). The essay was again translated into English by H. G. and Cary F. Baynes in *Contributions to Analytical Psychology* (London and New York, 1928), and this version has been freely consulted in the present translation.—EDITORS.]

² [In translating this and the following passages, I have, for the sake of clarity, assumed that the container is the man and the contained the woman. This assumption is due entirely to the exigencies of English grammar, and is not implied in the German text. Needless to say, the situation could just as easily be reversed.—TRANS.]

³ There are excellent descriptions of this type in H. Rider Haggard’s *She* (London, 1887) and Pierre Benoît’s *L’Atlantide* (Paris, 1920; trans. by Mary C. Tongue and Mary Ross as *Atlantida*, New York, 1920).

⁴ A passably good account of the animus is to be found in Marie Hay’s book *The Evil Vineyard* (New York, 1923), also in Elinor Wylie’s *Jennifer Lorn* (New York, 1923) and Selma Lagerlöf’s *Gösta Berlings Saga* (1891; English trans. by P. B. Flach, *The Story of Gösta Berling*, 1898).

EDITORIAL NOTE

When these Collected Works were planned, during the late 1940's, in consultation with Professor Jung, the Editors set aside a brief final volume for "reviews, short articles, etc., of the psychoanalytic period, later introductions, etc., Bibliography of Jung's Writings, and General Index of the Collected Works." Now arriving at publication soon after Jung's centenary year, this collection of miscellany has become the most ample volume in the edition—and no longer includes the Bibliography and General Index, which have been assigned to volumes 19 and 20 respectively.

Volume 18 now contains more than one hundred and thirty items, ranging in time from 1901, when Jung at 26 had just accepted his first professional appointment as an assistant at the Burghölzli, to 1961, shortly before his death. The collection, touching upon virtually every aspect of Jung's professional and intellectual interest during a long life devoted to the exegesis of the symbol, justifies its title, taken from a characteristic work of Jung's middle years, the seminar given to the Guild of Pastoral Psychology in London, 1939.

This profusion of material is the consequence of three factors. After Jung retired from his active medical practice, in the early 1950's, until his death in June 1961, he devoted most of his time to writing: not only the longer works for which a place was made in the original scheme of the edition, but an unexpectedly large number of forewords to books by pupils and colleagues, replies to journalistic questionnaires, encyclopaedia articles, occasional addresses, and letters (some of which, because of their technical character, or because they were published elsewhere, are included in Volume 18 rather than in the *Letters* volumes). Of works in this class, Jung wrote some fifty after 1950.

Secondly, research for the later volumes of the Collected Works, for the *Letters* (including *The Freud/Jung Letters*), and for the General Bibliography has brought to light many reviews, short articles, reports, etc., from the earlier years of Jung's career. A considerable run of psychiatric reviews from the years 1906–1910 was discovered by Professor Henri F. Ellenberger and turned over to the Editors, who wish to record their gratitude to him.

Finally, the Jung archives at Küsnacht have yielded several manuscripts in a finished or virtually finished state, the earliest being a 1901 report on Freud's *On Dreams*. A related category of material embraces abstracts of lectures, evidently unwritten, the transcripts of which were not read and approved by Jung. The abstracts themselves have been deemed worthy of inclusion in this volume.

“The Tavistock Lectures” and “The Symbolic Life” are examples of oral material to whose transcription Jung *had* given his approval. The former work has become well known as *Analytical Psychology: Its Theory and Practice*, under which title the present version was published in 1968.

Around 1960, the Editors conceived the idea of adding to Volume 15, *The Spirit in Man, Art, and Literature*, some of the forewords that Jung had written for books by other persons, on the ground that these statements were an expression of the archetype of the spirit. Jung was invited to make the choice, and his list comprised fifteen forewords, to books by the following authors: Lily Abegg, John Custance, Linda Fierz-David, Michael Fordham, M. Esther Harding (two books), Aniela Jaffé, Olga von Koenig-Fachsenfeld, Rose Mehlich, Fanny Moser, John Weir Perry, Carl Ludwig Schleich, Gustav Schmaltz, Hans Schmid-Guisan, and Oscar A. H. Schmitz. Subsequently, as the plan for a comprehensive volume of miscellany took form, these forewords were retained in Volume 18.

The contents of the present volume—following after the three longer and more general works in [Parts I, II, and III](#)—are arranged as [Parts IV](#) through [XVI](#), in the sequence of the volumes of the Collected Works to which they are related by subject, and chronologically within each Part. The result is sometimes arbitrary, as certain items could be assigned to more than one volume. Some miscellanea were published in later editions or printings of the previous volumes, e.g., “The Realities of Practical Psychotherapy,” now an appendix in Volume 16, 2nd edition; the prefatory note to the English edition of *Psychology and Alchemy*, now in the 2nd edition of Volume 12; and the author’s note to the first American/English edition of *Psychology of the Unconscious* (1916), now in Volume 5, 2nd edition, 1974 printing.

The death of the translator, R.F.C. Hull, in December 1974, after a prolonged illness, was a heavy loss to the entire enterprise. He had, however, translated by far most of the contents of Volume 18. The contributions of other translators are indicated by their initials in a footnote at the beginning of the translated item: A.S.B. Glover, Ruth Horine, Hildegard Nagel, Jane D. Pratt, Lisa Ress, and Wolfgang Sauerlander. To them the Editors are deeply grateful. Mr. Glover, up until his death in 1966, also played an important part in the compilation and editing of the papers. Special acknowledgement must be made to two co-workers at the source, as it were, who contributed greatly by searching out material and helping to identify and annotate the texts: Marianne Niehus-Jung (d. 1965), who was a co-editor of the Swiss edition of her father’s collected works, and Aniela Jaffé, who had been Jung’s secretary and collaborator with him in the writing of his memoirs.

Acknowledgement is made also to the following, who gave valued assistance with research and advice with various editorial problems: Mrs. Doris Albrecht, Dr. E. A. Bennet, Professor Ernst Benz, Jonathan Dodd, Dr. Martin Ebon, Mrs. Antoinette Fierz,

C.H.A. Fleurent (*British Medical Journal*) Dr. M.-L. von Franz, Dr. W. H. Gillespie, Michael Hamburger (also for permission to quote his translation of a poem of Hölderlin), J. Havet (Unesco), Dr. Joseph Henderson, Mrs. Aniela Jaffé, Mrs. Ernest Jones, Mrs. Jean Jones (American Psychiatric Association), Mr. and Mrs. Franz Jung, Dr. James Kirsch, Pamela Long, Professor Dr. C. A. Meier, Professor W. G. Moulton, Professor Henry A. Murray, Mrs. Julie Neumann, Jacob Rabi (*Al Hamishmar*), Lisa Ress, Professor Paul Roazen, Professor D. W. Robertson, Jr., Wolfgang Sauerlander, G. Spencer-Brown, Gerald Sykes, Professor Kurt Weinberg, and Mrs. Shirley White (BBC).

THE TAVISTOCK LECTURES

On the Theory and Practice of Analytical Psychology

EDITORIAL NOTE

C. G. Jung was invited by the Institute of Medical Psychology (Tavistock Clinic), Malet Place, London, at the instigation of Dr. J. A. Hadfield, to give a series of five lectures, which he delivered September 30 to October 4, 1935. According to the 1935 report of the Institute, the Lectures when announced were not titled. The audience, of some two hundred, consisted chiefly of members of the medical profession. A stenographic record was taken of the lectures and the subsequent discussions; the transcript was edited by Mary Barker and Margaret Game, passed by Professor Jung, and printed by mimeograph for private distribution by the Analytical Psychology Club of London, in 1936, under the title “Fundamental Psychological Conceptions: A Report of Five Lectures by C. G. Jung ...” The work has become widely known as “The Tavistock Lectures” or “The London Seminars.”

Passages from the Lectures were published in a French translation by Dr. Roland Cahen in his edition of Jung’s *L’Homme à la découverte de son âme* (Geneva, 1944; cf. *infra*, pars. 1357ff.), where the editor inserted them in a transcript of a series of seminars that Jung gave to the Société de Psychologie of Basel in 1934. Jung included much of the same material in both the London and Basel series as well as in lectures given in 1934 and 1935 at the Eidgenössische Technische Hochschule, Zurich.

The present text underwent stylistic revision by R.F.C. Hull, under the supervision of the Editors of the Collected Works, and the footnotes inserted by the original editors were augmented (in square brackets). The text was published in 1968 under the title *Analytical Psychology: Its Theory and Practice; The Tavistock Lectures* (New York: Pantheon Books, and London: Routledge & Kegan Paul), with the addition of a foreword, by E. A. Bennet, and an appendix giving biographical details of the participants in the discussion (both now omitted).

Grateful acknowledgment is made to Mrs. Barker and Mrs. Game, for their co-operation; to those living among the participants in the discussions who gave permission to reproduce their remarks; to Dr. Roland Cahen; and to Mr. Sidney Gray, present secretary of the Tavistock Institute of Medical Psychology, for his assistance.

For advice in the preparation of the notes, the Editors are obliged to Joseph Campbell, J. Desmond Clark, Etienne Gilson, Norbert Guterman, Mrs. Lilly Jung, E. Dale Saunders, and Mrs. Ruth Spiegel.

PREFATORY NOTE TO THE ORIGINAL EDITION

This report of Professor Jung's Lectures to the Institute of Medical Psychology is edited under the auspices of the Analytical Psychology Club, London.

On the whole the report is verbatim, though it has been considered advisable to alter the construction of certain sentences with a view to avoiding any ambiguity of meaning. The editors can only hope that in making these minor changes they have not destroyed the very individual flavour of the Lectures.

In a few cases it was found impossible to ascertain the names of those taking part in the discussions, nor was it practicable to submit proofs of their questions to each of the speakers. For this deficiency and for any possible errors in the reporting of questions we offer our apology.

The stencils of the charts, diagrams, and drawings have been cut with Professor Jung's permission from the originals in his possession.¹

Our thanks are due to the Institute of Medical Psychology not only for giving the Analytical Psychology Club permission to report the Lectures but also for facilitating the work in every way. To Miss Toni Wolff we would express our special gratitude for helping us with our task. Finally, and above all, we wish to thank Professor Jung for answering questions about difficult points and for passing the report in its final form.

MARY BARKER
MARGARET GAME

London, October 1935

LECTURE I

The Chairman (Dr. H. Crichton-Miller):

[1] Ladies and Gentlemen, I am here to express your welcome to Professor Jung, and it gives me great pleasure to do so. We have looked forward, Professor Jung, to your coming for several months with happy anticipation. Many of us no doubt have looked forward to these seminars hoping for new light. Most of us, I trust, are looking forward to them hoping for new light upon ourselves. Many have come here because they look upon you as the man who has saved modern psychology from a dangerous isolation in the range of human knowledge and science into which it was drifting. Some of us have come here because we respect and admire that breadth of vision with which you have boldly made the alliance between philosophy and psychology which has been so condemned in certain other quarters. You have restored for us the idea of value, the concept of human freedom in psychological thought; you have given us certain new ideas that to many of us have been very precious, and above all things you have not relinquished the study of the human psyche at the point where all science ends. For this and many other benefits which are known to each of us independently and individually we are grateful to you, and we anticipate with the highest expectations these meetings.

Professor Jung:

[2] Ladies and Gentlemen: First of all I should like to point out that my mother tongue is not English; thus if my English is not too good I must ask your forgiveness for any error I may commit.

[3] As you know, my purpose is to give you a short outline of certain fundamental conceptions of psychology. If my demonstration is chiefly concerned with my own principles or my own point of view, it is not that I overlook the value of the great contributions of other workers in this field. I do not want to push myself unduly into the foreground, but I can surely expect my audience to be as much aware of Freud's and Adler's merits as I am.

[4] Now as to our procedure, I should like to give you first a short idea of my programme. We have two main topics to deal with, namely, on the one side the concepts concerning the *structure of the unconscious mind* and its *contents*; on the other, the *methods* used in the *investigation* of contents originating in the unconscious psychic processes. The second topic falls into three parts, first, the word-association

method; second, the method of dream-analysis; and third, the method of active imagination.

[5] I know, of course, that I am unable to give you a full account of all there is to say about such difficult topics as, for instance, the philosophical, religious, ethical, and social problems peculiar to the collective consciousness of our time, or the processes of the collective unconscious and the comparative mythological and historical researches necessary for their elucidation. These topics, although apparently remote, are yet the most potent factors in making, regulating, and disturbing the personal mental condition, and they also form the root of disagreement in the field of psychological theories. Although I am a medical man and therefore chiefly concerned with psychopathology, I am nevertheless convinced that this particular branch of psychology can only be benefited by a considerably deepened and more extensive knowledge of the normal psyche in general. The doctor especially should never lose sight of the fact that diseases are disturbed normal processes and not *entia per se* with a psychology exclusively their own. *Similia similibus curantur* is a remarkable truth of the old medicine, and as a great truth it is also liable to become great nonsense. Medical psychology, therefore, should be careful not to become morbid itself. One-sidedness and restriction of horizon are well-known neurotic peculiarities.

[6] Whatever I may be able to tell you will undoubtedly remain a regrettably unfinished torso. Unfortunately I take little stock of new theories, as my empirical temperament is more eager for new facts than for what one might speculate about them, although this is, I must admit, an enjoyable intellectual pastime. Each new case is almost a new theory to me, and I am not quite convinced that this standpoint is a thoroughly bad one, particularly when one considers the extreme youth of modern psychology, which to my mind has not yet left its cradle. I know, therefore, that the time for general theories is not yet ripe. It even looks to me sometimes as if psychology had not yet understood either the gigantic size of its task, or the perplexingly and distressingly complicated nature of its subject-matter: the psyche itself. It seems as if we were just waking up to this fact, and that the dawn is still too dim for us to realize in full what it means that the psyche, being the *object* of scientific observation and judgment, is at the same time its *subject*, the *means* by which you make such observations. The menace of so formidably vicious a circle has driven me to an extreme of caution and relativism which has often been thoroughly misunderstood.

[7] I do not want to disturb our dealings by bringing up disquieting critical arguments. I only mention them as a sort of anticipatory excuse for seemingly unnecessary complications. I am not troubled by theories, but a great deal by facts; and I beg you therefore to keep in mind that the shortness of time at my disposal does not allow me to produce all the circumstantial evidence which would substantiate my

conclusions. I especially refer here to the intricacies of dream-analysis and to the comparative method of investigating the unconscious processes. In short, I have to depend a great deal upon your goodwill, but I realize naturally it is my own task in the first place to make things as plain as possible.

[8] Psychology is a science of consciousness, in the very first place. In the second place, it is the science of the products of what we call the unconscious psyche. We cannot directly explore the unconscious psyche because the unconscious is just unconscious, and we have therefore no relation to it. We can only deal with the conscious products which we suppose have originated in the field called the unconscious, that field of “dim representations” which the philosopher Kant in his *Anthropology*¹ speaks of as being half a world. Whatever we have to say about the unconscious is what the conscious mind says about it. Always the unconscious psyche, which is entirely of an unknown nature, is expressed by consciousness and in terms of consciousness, and that is the only thing we can do. We cannot go beyond that, and we should always keep it in mind as an ultimate critique of our judgment.

[9] Consciousness is a peculiar thing. It is an intermittent phenomenon. One-fifth, or one-third, or perhaps even one-half of our human life is spent in an unconscious condition. Our early childhood is unconscious. Every night we sink into the unconscious, and only in phases between waking and sleeping have we a more or less clear consciousness. To a certain extent it is even questionable how clear that consciousness is. For instance, we assume that a boy or girl ten years of age would be conscious, but one could easily prove that it is a very peculiar kind of consciousness, for it might be a consciousness without any consciousness of the *ego*. I know a number of cases of children eleven, twelve, and fourteen years of age, or even older, suddenly realizing “I am.” For the first time in their lives they know that they themselves are experiencing, that they are looking back over a past in which they can remember things happening but cannot remember that they were in them.

[10] We must admit that when we say “I” we have no absolute criterion whether we have a full experience of “I” or not. It might be that our realization of the ego is still fragmentary and that in some future time people will know very much more about what the ego means to man than we do. As a matter of fact, we cannot see where that process might ultimately end.

[11] Consciousness is like a surface or a skin upon a vast unconscious area of unknown extent. We do not know how far the unconscious rules because we simply know nothing of it. You cannot say anything about a thing of which you know nothing. When we say “the unconscious” we often mean to convey something by the term, but as a matter of fact we simply convey that we do not know what the unconscious is. We have only indirect proofs that there is a mental sphere which is subliminal. We have some scientific justification for our conclusion that it exists.

From the products which that unconscious mind produces we can draw certain conclusions as to its possible nature. But we must be careful not to be too anthropomorphic in our conclusions, because things might in reality be very different from what our consciousness makes them.

[12] If, for instance, you look at our physical world and if you compare what our consciousness makes of this same world, you find all sorts of mental pictures which do not exist as objective facts. For instance, we see colour and hear sound, but in reality they are oscillations. As a matter of fact, we need a laboratory with very complicated apparatus in order to establish a picture of that world apart from our senses and apart from our psyche; and I suppose it is very much the same with our unconscious—we ought to have a laboratory in which we could establish by objective methods how things really are when in an unconscious condition. So any conclusion or any statement I make in the course of my lectures about the unconscious should be taken with that critique in mind. It is always *as if*, and you should never forget that restriction.

[13] The conscious mind moreover is characterized by a certain narrowness. It can hold only a few simultaneous contents at a given moment. All the rest is unconscious at the time, and we only get a sort of continuation or a general understanding or awareness of a conscious world through the *succession* of conscious moments. We can never hold an image of totality because our consciousness is too narrow; we can only see flashes of existence. It is always as if we were observing through a slit so that we only see a particular moment; all the rest is dark and we are not aware of it at that moment. The area of the unconscious is enormous and always continuous, while the area of consciousness is a restricted field of momentary vision.

[14] Consciousness is very much the product of perception and orientation in the *external* world. It is probably localized in the cerebrum, which is of ectodermic origin and was probably a sense organ of the skin at the time of our remote ancestors. The consciousness derived from that localization in the brain therefore probably retains these qualities of sensation and orientation. Peculiarly enough, the French and English psychologists of the early seventeenth and eighteenth centuries tried to derive consciousness from the senses as if it consisted solely of sense data. That is expressed by the famous formula *Nihil est in intellectu quod non fuerit in sensu*.² You can observe something similar in modern psychological theories. Freud, for instance, does not derive the conscious from sense data, but he derives the unconscious from the conscious, which is along the same rational line.

[15] I would put it the reverse way: I would say the thing that comes first is obviously the unconscious and that consciousness really arises from an unconscious condition. In early childhood we are unconscious; the most important functions of an instinctive

nature are unconscious, and consciousness is rather the product of the unconscious. It is a condition which demands a violent effort. You get tired from being conscious. You get exhausted by consciousness. It is an almost unnatural effort. When you observe primitives, for instance, you will see that on the slightest provocation or with no provocation whatever they doze off, they disappear. They sit for hours on end, and when you ask them, "What are you doing? What are you thinking?" they are offended, because they say, "Only a man that is crazy thinks—he has thoughts in his head. We do not think." If they think at all, it is rather in the belly or in the heart. Certain Negro tribes assure you that thoughts are in the belly because they only realize those thoughts which actually disturb the liver, intestines, or stomach. In other words, they are conscious only of emotional thoughts. Emotions and affects are always accompanied by obvious physiological innervations.

[16] The Pueblo Indians told me that all Americans are crazy, and of course I was somewhat astonished and asked them why. They said, "Well, they say they think in their heads. No sound man thinks in the head. *We* think in the heart." They are just about in the Homeric age, when the diaphragm (*phren* = mind, soul) was the seat of psychic activity. That means a psychic localization of a different nature. *Our* concept of consciousness supposes thought to be in our most dignified head. But the Pueblo Indians derive consciousness from the intensity of feeling. Abstract thought does not exist for them. As the Pueblo Indians are sun-worshippers, I tried the argument of St. Augustine on them. I told them that God is not the sun but the one who made the sun.³ They could not accept this because they cannot go beyond the perceptions of their senses and their feelings. Therefore consciousness and thought to them are localized in the heart. To us, on the other hand, psychic activities are nothing. We hold that dreams and fantasies are localized "down below," therefore there are people who speak of the *sub*-conscious mind, of the things that are *below* consciousness.

[17] These peculiar localizations play a great role in so-called primitive psychology, which is by no means primitive. For instance if you study Tantric Yoga and Hindu psychology you will find the most elaborate system of psychic layers, of localizations of consciousness up from the region of the perineum to the top of the head. These "centres" are the so-called *chakras*⁴ and you not only find them in the teachings of yoga but can discover the same idea in old German alchemical books,⁵ which surely do not derive from a knowledge of yoga.

[18] The important fact about consciousness is that nothing can be conscious without an ego to which it refers. If something is not related to the ego then it is not conscious. Therefore you can define consciousness as a relation of psychic facts to the ego. What is that ego? The ego is a complex datum which is constituted first of all by a general awareness of your body, of your existence, and secondly by your

memory data; you have a certain idea of having been, a long series of memories. Those two are the main constituents of what we call the ego. Therefore you can call the ego a complex of psychic facts. This complex has a great power of attraction, like a magnet; it attracts contents from the unconscious, from that dark realm of which we know nothing; it also attracts impressions from the outside, and when they enter into association with the ego they are conscious. If they do not, they are not conscious.

[19] My idea of the ego is that it is a sort of complex. Of course, the nearest and dearest complex which we cherish is our ego. It is always in the centre of our attention and of our desires, and it is the absolutely indispensable centre of consciousness. If the ego becomes split up, as in schizophrenia, all sense of values is gone, and also things become inaccessible for voluntary reproduction because the centre has split and certain parts of the psyche refer to one fragment of the ego and certain other contents to another fragment of the ego. Therefore, with a schizophrenic, you often see a rapid change from one personality into another.

[20] You can distinguish a number of functions in consciousness. They enable consciousness to become oriented in the field of ectopsychic facts and endopsychic facts. What I understand by the *ectopsyche* is a system of relationship between the contents of consciousness and facts and data coming in from the environment. It is a system of orientation which concerns my dealing with the external facts given to me by the function of my senses. The *endopsyche*, on the other hand, is a system of relationship between the contents of consciousness and postulated processes in the unconscious.

[21] In the first place we will speak of the ectopsychic functions. First of all we have *sensation*,⁶ our sense function. By sensation I understand what the French psychologists call “la fonction du réel,” which is the sum-total of my awareness of external facts given to me through the function of my senses. So I think that the French term “la fonction du réel” explains it in the most comprehensive way. Sensation tells me that something *is*: it does not tell me *what* it is and it does not tell me other things about that something; it only tells me that something is.

[22] The next function that is distinguishable is *thinking*.⁷ Thinking, if you ask a philosopher, is something very difficult, so never ask a philosopher about it because he is the only man who does not know what thinking is. Everybody else knows what thinking is. When you say to a man, “Now think properly,” he knows exactly what you mean, but a philosopher never knows. Thinking in its simplest form tells you *what* a thing is. It gives a name to the thing. It adds a concept because thinking is perception and judgment. (German psychology calls it apperception.)⁸

[23] The third function you can distinguish and for which ordinary language has a term is *feeling*.⁹ Here minds become very confused and people get angry when I

speak about feeling, because according to their view I say something very dreadful about it. Feeling informs you through its feeling-tones of the *values* of things. Feeling tells you for instance whether a thing is acceptable or agreeable or not. It tells you what a thing is *worth* to you. On account of that phenomenon, you cannot perceive and you cannot apperceive without having a certain feeling reaction. You always have a certain feeling-tone, which you can even demonstrate by experiment. We will talk of these things later on. Now the “dreadful” thing about feeling is that it is, like thinking, a *rational*¹⁰ function. All men who think are absolutely convinced that feeling is never a rational function but, on the contrary, most irrational. Now I say: Just be patient for a while and realize that man cannot be perfect in every respect. If a man is perfect in his thinking he is surely never perfect in his feeling, because you cannot do the two things at the same time; they hinder each other. Therefore when you want to think in a dispassionate way, really scientifically or philosophically, you must get away from all feeling-values. You cannot be bothered with feeling-values at the same time, otherwise you begin to feel that it is far more important to think about the freedom of the will than, for instance, about the classification of lice. And certainly if you approach from the point of view of feeling the two objects are not only different as to *facts* but also as to *value*. Values are no anchors for the intellect, but they exist, and giving value is an important psychological function. If you want to have a complete picture of the world you must necessarily consider values. If you do not, you will get into trouble. To many people feeling appears to be most irrational, because you feel all sorts of things in foolish moods; therefore everybody is convinced, in this country particularly, that you should control your feelings. I quite admit that this is a good habit and wholly admire the English for that faculty. Yet there are such things as feelings, and I have seen people who control their feelings marvellously well and yet are terribly bothered by them.

[24] Now the fourth function. Sensation tells us that a thing *is*. Thinking tells us *what* that thing is, feeling tells us what it is *worth* to us. Now what else could there be? One would assume one has a complete picture of the world when one knows there *is* something, *what* it is, and what it is *worth*. But there is another category, and that is time. Things have a past and they have a future. They come from somewhere, they go to somewhere, and you cannot see where they came from and you cannot know where they go to, but you get what the Americans call a hunch. For instance, if you are a dealer in art or in old furniture you get a hunch that a certain object is by a very good master of 1720, you get a hunch that it is good work. Or you do not know what shares will do after a while, but you get the hunch that they will rise. That is what is called *intuition*,¹¹ a sort of divination, a sort of miraculous faculty. For instance, you do not know that your patient has something on his mind of a very painful kind, but you “get an idea,” you “have a certain feeling,” as we say, because ordinary language

is not yet developed enough for one to have suitably defined terms. The word intuition becomes more and more a part of the English language, and you are very fortunate because in other languages that word does not exist. The Germans cannot even make a linguistic distinction between sensation and feeling. It is different in French; if you speak French you cannot possibly say that you have a certain “sentiment dans l’estomac,” you will say “sensation”; in English you also have your distinctive words for sensation and feeling. But you can mix up *feeling* and *intuition* easily. Therefore it is an almost artificial distinction I make here, though for practical reasons it is most important that we make such a differentiation in scientific language. We must define what we mean when we use certain terms, otherwise we talk an unintelligible language, and in psychology this is always a misfortune. In ordinary conversation, when a man says feeling, he means possibly something entirely different from another fellow who also talks about feeling. There are any number of psychologists who use the word *feeling*, and they define it as a sort of crippled thought. “Feeling is nothing but an unfinished thought”—that is the definition of a well-known psychologist. But feeling is something genuine, it is something real, it is a function, and therefore we have a word for it. The instinctive natural mind always finds the words that designate things which really have existence. Only psychologists invent words for things that do not exist.

[25] The last-defined function, intuition, seems to be very mysterious, and you know I am “very mystical,” as people say. This then is one of my pieces of mysticism! Intuition is a function by which you see round corners, which you really cannot do; yet the fellow will do it for you and you trust him. It is a function which normally you do not use if you live a regular life within four walls and do regular routine work. But if you are on the Stock Exchange or in Central Africa, you will use your hunches like anything. You cannot, for instance, calculate whether when you turn round a corner in the bush you will meet a rhinoceros or a tiger—but you get a hunch, and it will perhaps save your life. So you see that people who live exposed to natural conditions use intuition a great deal, and people who risk something in an unknown field, who are pioneers of some sort, will use intuition. Inventors will use it and judges will use it. Whenever you have to deal with strange conditions where you have no established values or established concepts, you will depend upon that faculty of intuition.

[26] I have tried to describe that function as well as I can, but perhaps it is not very good. I say that intuition is a sort of perception which does not go exactly by the senses, but it goes via the unconscious, and at that I leave it and say “I don’t know how it works.” I do not know what is happening when a man knows something he definitely should not know. I do not know how he has come by it, but he has it all right and he can act on it. For instance, anticipatory dreams, telepathic phenomena,

and all that kind of thing are intuitions. I have seen plenty of them, and I am convinced that they do exist. You can see these things also with primitives. You can see them everywhere if you pay attention to these perceptions that somehow work through the subliminal data, such as sense-perceptions so feeble that our consciousness simply cannot take them in. Sometimes, for instance, in cryptomnesia, something creeps up into consciousness; you catch a word which gives you a suggestion, but it is always something that is unconscious until the moment it appears, and so presents itself as if it had fallen from heaven. The Germans call this an *Einfall*, which means a thing which falls into your head from nowhere. Sometimes it is like a revelation. Actually, intuition is a very natural function, a perfectly normal thing, and it is necessary, too, because it makes up for what you cannot perceive or think or feel because it lacks reality. You see, the past is not real any more and the future is not as real as we think. Therefore we must be very grateful to heaven that we have such a function which gives us a certain light on those things which are round the corners. Doctors, of course, being often presented with the most unheard-of situations, need intuition a great deal. Many a good diagnosis comes from this “very mysterious” function.

[27] Psychological functions are usually controlled by the will, or we hope they are, because we are afraid of everything that moves by itself. When the functions are controlled they can be excluded from use, they can be suppressed, they can be selected, they can be increased in intensity, they can be directed by will-power, by what we call intention. But they also can function in an involuntary way, that is, they think for you, they feel for you—very often they do this and you cannot even stop them. Or they function unconsciously so that you do not know what they have done, though you might be presented, for instance, with the result of a feeling process which has happened in the unconscious. Afterwards somebody will probably say, “Oh, you were very angry, or you were offended, and therefore you reacted in such and such a way.” Perhaps you are quite unconscious that you have felt in that way, nevertheless it is most probable that you have. Psychological functions, like the sense functions, have their specific energy. You cannot dispose of feeling, or of thinking, or of any of the four functions. No one can say, “I will not think”—he will think inevitably. People cannot say, “I will not feel”—they will feel because the specific energy invested in each function expresses itself and cannot be exchanged for another.

[28] Of course, one has preferences. People who have a good mind prefer to think about things and to adapt by thinking. Other people who have a good feeling function are good social mixers, they have a great sense of values; they are real artists in creating feeling situations and living by feeling situations. Or a man with a keen sense of objective observation will use his sensation chiefly, and so on. The

dominating function gives each individual his particular kind of psychology. For example, when a man uses chiefly his intellect, he will be of an unmistakable type, and you can deduce from that fact the condition of his feeling. When thinking is the dominant or superior function, feeling is necessarily in an inferior condition.¹² The same rule applies to the other three functions. But I will show you that with a diagram which will make it clear.

[29] You can make the so-called cross of the functions (Figure 1).

FIG. 1. The Functions

In the centre is the *ego* (E), which has a certain amount of energy at its disposal, and that energy is the will-power. In the case of the thinking type, that will-power can be directed to *thinking* (T). Then we must put *feeling* (F) down below, because it is, in this case, the *inferior function*.¹³ That comes from the fact that when you think you must exclude feeling, just as when you feel you must exclude thinking. If you are thinking, leave feeling and feeling-values alone, because feeling is most upsetting to your thoughts. On the other hand people who go by feeling-values leave thinking well alone, and they are right to do so, because these two different functions contradict each other. People have sometimes assured me that their thinking was just as differentiated as their feeling, but I could not believe it, because an individual cannot have the two opposites in the same degree of perfection at the same time.

[30] The same is the case with *sensation* (S) and *intuition* (I). How do they affect each other? When you are observing physical facts you cannot see round corners at the

same time. When you observe a man who is working by his sense function you will see, if you look at him attentively, that the axes of his eyes have a tendency to converge and to come together at one point. When you study the expression or the eyes of intuitive people, you will see that they only glance at things—they do not look, they radiate at things because they take in their fulness, and among the many things they perceive they get one point on the periphery of their field of vision and that is the *hunch*. Often you can tell from the eyes whether people are intuitive or not. When you have an intuitive attitude you usually do not as a rule observe the details. You try always to take in the whole of a situation, and then suddenly something crops up out of this wholeness. When you are a sensation type you will observe facts as they are, but then you have no intuition, simply because the two things cannot be done at the same time. It is too difficult, because the principle of the one function excludes the principle of the other function. That is why I put them here as opposites.

[31] Now, from this simple diagram you can arrive at quite a lot of very important conclusions as to the structure of a given consciousness. For instance, if you find that *thinking* is highly differentiated, then feeling is undifferentiated. What does that mean? Does it mean these people have no feelings? No, on the contrary. They say, “I have very strong feelings. I am full of emotion and temperament.” These people are under the sway of their emotions, they are caught by their emotions, they are overcome by their emotions at times. If, for instance, you study the private life of professors it is a very interesting study. If you want to be fully informed as to how the intellectual behaves at home, ask his wife and she will be able to tell you a story!

[32] The reverse is true of the *feeling* type. The feeling type, if he is natural, never allows himself to be disturbed by thinking; but when he gets sophisticated and somewhat neurotic he is disturbed by thoughts. Then thinking appears in a compulsory way, he cannot get away from certain thoughts. He is a very nice chap, but he has extraordinary convictions and ideas, and his thinking is of an inferior kind. He is caught by this thinking, entangled in certain thoughts; he cannot disentangle because he cannot reason, his thoughts are not movable. On the other hand, an intellectual, when caught by his feelings, says, “I feel just like that,” and there is no argument against it. Only when he is thoroughly boiled in his emotion will he come out of it again. He cannot be reasoned out of his feeling, and he would be a very incomplete man if he could.

[33] The same happens with the *sensation* type and the *intuitive* type. The intuitive is always bothered by the reality of things; he fails from the standpoint of realities; he is always out for the possibilities of life. He is the man who plants a field and before the crop is ripe is off again to a new field. He has ploughed fields behind him and new hopes ahead all the time, and nothing comes off. But the sensation type remains with

things. He remains in a given reality. To him a thing is true when it is real. Consider what it means to an intuitive when something is real. It is just the wrong thing; it should not be, something else should be. But when a sensation type does not have a given reality—four walls in which to be—he is sick. Give the intuitive type four walls in which to be, and the only thing is how to get out of it, because to him a given situation is a prison which must be undone in the shortest time so that he can be off to new possibilities.

[34] These differences play a very great role in practical psychology. Do not think I am putting people into this box or that and saying, “He is an intuitive,” or “He is a thinking type.” People often ask me, “Now, is So-and-So not a thinking type?” I say, “I never thought about it,” and I did not. It is no use at all putting people into drawers with different labels. But when you have a large empirical material, you need critical principles of order to help you to classify it. I hope I do not exaggerate, but to me it is very important to be able to create a kind of order in my empirical material, particularly when people are troubled and confused or when you have to explain them to somebody else. For instance, if you have to explain a wife to a husband or a husband to a wife, it is often very helpful to have these objective criteria, otherwise the whole thing remains “He said”—“She said.”

[35] As a rule, the inferior function does not possess the qualities of a conscious differentiated function. The conscious differentiated function can as a rule be handled by intention and by the will. If you are a real thinker, you can direct your thinking by your will, you can control your thoughts. You are not the slave of your thoughts, you can think of something else. You can say, “I can think something quite different, I can think the contrary.” But the feeling type can never do that because he cannot get rid of his thought. The thought possesses him, or rather he is possessed by thought. Thought has a fascination for him, therefore he is afraid of it. The intellectual type is afraid of being caught by feeling because his feeling has an archaic quality, and there he is like an archaic man—he is the helpless victim of his emotions. It is for this reason that primitive man is extraordinarily polite, he is very careful not to disturb the feelings of his fellows because it is dangerous to do so. Many of our customs are explained by that archaic politeness. For instance, it is not the custom to shake hands with somebody and keep your left hand in your pocket, or behind your back, because it must be visible that you do not carry a weapon in that hand. The Oriental greeting of bowing with hands extended palms upward means “I have nothing in my hands.” If you kowtow you dip your head to the feet of the other man so that he sees you are absolutely defenceless and that you trust him completely. You can still study the symbolism of manners with primitives, and you can also see why they are afraid of the other fellow. In a similar way, we are afraid of our inferior functions. If you take a typical intellectual who is terribly afraid of falling in love, you will think his fear

very foolish. But he is most probably right, because he will very likely make foolish nonsense when he falls in love. He will be caught most certainly, because his feeling only reacts to an archaic or to a dangerous type of woman. This is why many intellectuals are inclined to marry beneath them. They are caught by the landlady perhaps, or by the cook, because they are unaware of their archaic feeling through which they get caught. But they are right to be afraid, because their undoing will be in their feeling. Nobody can attack them in their intellect. There they are strong and can stand alone, but in their feelings they can be influenced, they can be caught, they can be cheated, and they know it. Therefore never force a man into his feeling when he is an intellectual. He controls it with an iron hand because it is very dangerous.

[36] The same law applies to each function. The inferior function is always associated with an archaic personality in ourselves; in the inferior function we are all primitives. In our differentiated functions we are civilized and we are supposed to have free will; but there is no such thing as free will when it comes to the inferior function. There we have an open wound, or at least an open door through which anything might enter.

[37] Now I am coming to the *endopsychic functions* of consciousness. The functions of which I have just spoken rule or help our conscious orientation in our relations with the environment; but they do not apply to the relation of things that are as it were below the ego. The ego is only a bit of consciousness which floats upon the ocean of the dark things. The dark things are the inner things. On that inner side there is a layer of psychic events that forms a sort of fringe of consciousness round the ego. I will illustrate it by a diagram:

FIG. 2. The Ego

[38] If you suppose AA' to be the threshold of consciousness, then you would have in D an area of consciousness referring to the ectopsychic world B , the world ruled by those functions of which we were just speaking. But on the other side, in C , is the *shadow-world*. There the ego is somewhat dark, we do not see into it, we are an

enigma to ourselves. We only know the ego in D, we do not know it in C. Therefore we are always discovering something new about ourselves. Almost every year something new turns up which we did not know before. We always think we are now at the end of our discoveries. We never are. We go on discovering that we are this, that, and other things, and sometimes we have astounding experiences. That shows there is always a part of our personality which is still unconscious, which is still becoming: we are unfinished; we are growing and changing. Yet that future personality which we are to be in a year's time is already here only it is still in the shadow. The ego is like a moving frame on a film. The future personality is not yet visible, but we are moving along, and presently we come to view the future being. These potentialities naturally belong to the dark side of the ego. We are well aware of what we have been, but we are not aware of what we are going to be.

[39] Therefore the *first* function on that endopsychic side is *memory*. The function of memory, or reproduction, links us up with things that have faded out of consciousness, things that became subliminal or were cast away or repressed. What we call memory is this faculty to reproduce unconscious contents, and it is the first function we can clearly distinguish in its relationship between our consciousness and the contents that are actually not in view.

[40] The *second* endopsychic function is a more difficult problem. We are now getting into deep waters because here we are coming into darkness. I will give you the name first: *the subjective components of conscious functions*. I hope I can make it clear. For instance, when you meet a man you have not seen before, naturally you think something about him. You do not always think things you would be ready to tell him immediately; perhaps you think things that are untrue, that do not really apply. Clearly, they are subjective reactions. The same reactions take place with things and with situations. Every application of a conscious function, whatever the object might be, is always accompanied by subjective reactions which are more or less inadmissible or unjust or inaccurate. You are painfully aware that these things happen in you, but nobody likes to admit that he is subject to such phenomena. He prefers to leave them in the shadow, because that helps him to assume that he is perfectly innocent and very nice and honest and straightforward and "only too willing" etc.,—you know all these phrases. As a matter of fact, one is not. One has any amount of subjective reactions, but it is not quite becoming to admit these things. These reactions I call the subjective components. They are a very important part of our relations to our own inner side. There things get definitely painful. That is why we dislike entering this shadow-world of the ego. We do not like to look at the shadowside of ourselves; therefore there are many people in our civilized society who have lost their shadow altogether, they have got rid of it. They are only two-dimensional; they have lost the third dimension, and with it they have usually lost the

body. The body is a most doubtful friend because it produces things we do not like; there are too many things about the body which cannot be mentioned. The body is very often the personification of this shadow of the ego. Sometimes it forms the skeleton in the cupboard, and everybody naturally wants to get rid of such a thing. I think this makes sufficiently clear what I mean by subjective components. They are usually a sort of disposition to react in a certain way, and usually the disposition is not altogether favourable.

[41] There is one exception to this definition: a person who is not, as we suppose we all are, living on the positive side, putting the right foot forward and not the wrong one, etc. There are certain individuals whom we call in our Swiss dialect “pitch-birds” [*Pechvögel*]; they are always getting into messes, they put their foot in it and always cause trouble, because they *live* their own shadow, they live their own negation. They are the sort of people who come late to a concert or a lecture, and because they are very modest and do not want to disturb other people, they sneak in at the end and then stumble over a chair and make a hideous racket so that everybody has to look at them. Those are the “pitch-birds.”

[42] Now we come to the *third* endopsychic component—I cannot say function. In the case of memory you can speak of a function, but even your memory is only to a certain extent a voluntary or controlled function. Very often it is exceedingly tricky; it is like a bad horse that cannot be mastered. It often refuses in the most embarrassing way. All the more is this the case with the subjective components and reactions. And now things begin to get worse, for this is where the *emotions* and *affects* come in. They are clearly not functions any more, they are just events, because in an emotion, as the word denotes, you are moved away, you are cast out, your decent ego is put aside, and something else takes your place. We say, “He is beside himself,” or “The devil is riding him,” or “What has gotten into him today,” because he is like a man who is possessed. The primitive does not say he got angry beyond measure; he says a spirit got into him and changed him completely. Something like that happens with emotions; you are simply possessed, you are no longer yourself, and your control is decreased practically to zero. That is a condition in which the inner side of a man takes hold of him, he cannot prevent it. He can clench his fists, he can keep quiet, but it has him nevertheless.

[43] The *fourth* important endopsychic factor is what I call *invasion*. Here the shadow-side, the unconscious side, has full control so that it can break into the conscious condition. Then the conscious control is at its lowest. Those are the moments in a human life which you do not necessarily call pathological; they are pathological only in the old sense of the word when pathology meant the science of the passions. In that sense you can call them pathological, but it is really an extraordinary condition

in which a man is seized upon by his unconscious and when anything may come out of him. One can lose one's mind in a more or less normal way. For instance, we cannot assume that the cases our ancestors knew very well are abnormal, because they are perfectly normal phenomena among primitives. They speak of the devil or an incubus or a spirit going into a man, or of his soul leaving him, one of his separate souls—they often have as many as six. When his soul leaves him, he is in an altered condition because he is suddenly deprived of himself; he suffers a loss of self. That is a thing you can often observe in neurotic patients. On certain days, or from time to time, they suddenly lose their energy, they lose themselves, and they come under a strange influence. These phenomena are not in themselves pathological; they belong to the ordinary phenomenology of man, but if they become habitual we rightly speak of a neurosis. These are the things that lead to neurosis; but they are also exceptional conditions among normal people. To have overwhelming emotions is not in itself pathological, it is merely undesirable. We need not invent such a word as pathological for an undesirable thing, because there are other undesirable things in the world which are not pathological, for instance, tax-collectors.

Discussion

Dr. J. A. Hadfield:

[44] In what sense do you use the word “emotion”? You used the word “feeling” rather in the sense in which many people here use the word “emotion.” Do you give the term “emotion” a special significance or not?

Professor Jung:

[45] I am glad you have put that question, because there are usually great mistakes and misunderstandings concerning the use of the word emotion. Naturally everybody is free to use words as he likes, but in scientific language you are bound to cling to certain distinctions so that everyone knows what you are talking about. You will remember I explained “feeling” as a function of valuing, and I do not attach any particular significance to feeling. I hold that feeling is a rational function if it is differentiated. When it is not differentiated it just happens, and then it has all the archaic qualities which can be summed up by the word “unreasonable.” But conscious feeling is a rational function of discriminating values.

[46] If you study emotions you will invariably find that you apply the word “emotional” when it concerns a condition that is characterized by physiological innervations. Therefore you can measure emotions to a certain extent, not their psychic part but the physiological part. You know the James-Lange theory of affect.¹⁴ I take emotion as affect, it is the same as “something affects you.” It does something to you—it interferes with you. Emotion is the thing that carries you away. You are thrown out of yourself; you are beside yourself as if an explosion had moved you out of yourself and put you beside yourself. There is a quite tangible physiological condition which can be observed at the same time. So the difference would be this: feeling has no physical or tangible physiological manifestations, while emotion is characterized by an altered physiological condition. You know that the James-Lange theory of affect says that you only get really emotional when you are aware of the physiological alteration of your general condition. You can observe this when you are in a situation where you would most probably be angry. You know you are going to be angry, and then you feel the blood rushing up into your head, and *then* you are really angry, but not before. Before, you only know you are going to be angry, but when the blood rushes up into your head you are caught by your own anger, immediately the body is affected, and because you realize that you are getting excited, you are twice as angry as you ought to be. Then you are in a real emotion. But when you have *feeling* you have control. You are on top of the situation, and you

can say, "I have a very nice feeling or a very bad feeling about it." Everything is quiet and nothing happens. You can quietly inform somebody, "I hate you," very nicely. But when you say it spitefully you have an emotion. To say it quietly will not cause an emotion, either in yourself or in the other person. Emotions are most contagious, they are the real carriers of mental contagion. For instance, if you are in a crowd that is in an emotional condition, you cannot help yourself, you are in it too, you are caught by that emotion. But the feelings of other people do not concern you in the least, and for this reason you will observe that the differentiated feeling type usually has a cooling effect upon you, while the emotional person heats you up because the fire is radiating out of him all the time. You see the flame of that emotion in his face. By sympathy your sympathetic system gets disturbed, and you will show very much the same signs after a while. That is not so with feelings. Do I make myself clear?

Dr. Henry V. Dicks:

[47] May I ask, in continuation of that question, what is the relation in your view between affects and feelings?

Professor Jung:

[48] It is a question of degree. If you have a value which is overwhelmingly strong for you it will become an emotion at a certain point, namely, when it reaches such an intensity as to cause a physiological innervation. All our mental processes probably cause slight physiological disturbances which are so small that we have not the means to demonstrate them. But we have a pretty sensitive method by which to measure emotions, or the physiological part of them, and that is the psychogalvanic effect.¹⁵ It is based on the fact that the electrical resistance of the skin decreases under the influence of emotion. It does not decrease under the influence of feeling.

[49] I will give you an example. I made the following experiment with my former Professor at the Clinic. He functioned as my test partner, and I had him in the laboratory under the apparatus for measuring the psychogalvanic effect. I told him to imagine something which was intensely disagreeable to him but of which he knew I was not aware, something unknown to me yet known to him and exceedingly painful. So he did. He was well acquainted with such experiments and gifted with great power of concentration, so he concentrated on something, and there was almost no visible disturbance of the electrical resistance of the skin; the current did not increase at all. Then I thought I had a hunch. That very morning I had observed certain signs of something going on and I guessed it must be hellishly disagreeable to my chief. So I thought, "I am going to try something." I simply said to him, "Was not that the case

of So-and-So?”—mentioning the name. Instantly there was a deluge of emotion. That was the *emotion*; the former reaction was the *feeling*.

[50] It is a curious fact that hysterical pain does not cause contraction of the pupils, it is not accompanied by physiological innervation, and yet it is an intense pain. But physical pain causes contraction of the pupils. You can have an intense feeling and no physiological alteration; but as soon as you have physiological alteration you are possessed, you are dissociated, thrown out of your own house, and the house is then free for the devils.

Dr. Eric Graham Howe:

[51] Could we equate emotion and feeling with conation and cognition respectively? Whereas feeling corresponds to cognition, emotion is conative.

Professor Jung:

[52] Yes, one could say that in philosophical terminology. I have no objection.

Dr. Howe:

[53] May I have another shot? Your classification into four functions, namely those of sensation, thinking, feeling, and intuition, seems to me to correspond with the one-, two-, three-, and four-dimensional classification. You yourself used the word “three-dimensional” referring to the human body, and you also said that intuition differed from the other three in that it was the function which included Time. Perhaps, therefore, it corresponds to a fourth dimension? In that case, I suggest that “sensation” corresponds with one-dimensional, “perceptual cognition” with two-dimensional, “conceptual cognition” (which would correspond perhaps with your “feeling”) with three-dimensional, and “intuition” with four-dimensional on this system of classification.

Professor Jung:

[54] You can put it like that. Since intuition sometimes seems to function as if there were no space, and sometimes as if there were no time, you might say that I add a sort of fourth dimension. But one should not go too far. The concept of the fourth dimension does not produce facts. Intuition is something like H. G. Wells’s Time Machine. You remember the time machine, that peculiar motor, which when you sit on it moves off with you into time instead of into space. It consists of four columns, three of which are always visible, but the fourth is visible only indistinctly because it represents the time element. I am sorry but the awkward fact is that intuition is

something like this fourth column. There is such a thing as unconscious perception, or perception by ways which are unconscious to us. We have the empirical material to prove the existence of this function. I am sorry that there are such things. My intellect would wish for a clear-cut universe with no dim corners, but there are these cobwebs in the cosmos. Nevertheless I do not think there is anything mystical about intuition. Can you explain beyond any possibility of doubt why, for instance, some birds travel enormous distances, or the doings of caterpillars, butterflies, ants, or termites? There you have to deal with quite a number of questions. Or take the fact of water having the greatest density at 4° Centigrade. Why such a thing? Why has energy a limitation to quantum? Well, it has, and that is awkward; it is not right that such things should be, but they are. It is exactly like the old question, “Why has God made flies?”—He just has.

Dr. Wilfred R. Bion:

[55] In your experiment why did you ask the Professor to think of an experience which was painful to himself and unknown to you? Do you think there is any significance in the fact that he knew you knew of the unpleasant experience in the second experiment and that this had some bearing on the difference of emotional reaction which he showed in the two examples you gave?

Professor Jung:

[56] Yes, absolutely. My idea was based on the fact that when I know that my partner does not know, it is far more agreeable to me; but when I know that he knows too, it is a very different thing and is very disagreeable. In any doctor's life there are cases which are more or less painful when a colleague knows about them, and I knew almost for a certainty that if I gave him a hint that I knew, he would jump like a mine, and he did. That was my reason.

Dr. Eric B. Strauss:

[57] Would Dr. Jung make clearer what he means when he says that feeling is a rational function? Further, I do not quite understand what Dr. Jung means by feeling. Most of us when we employ the term feeling understand polarities such as pleasure, pain, tension, and relaxation. Further, Dr. Jung claims that the distinction between feelings and emotions is only one of degree. If the distinction is only one of degree, how is it that he puts them on different sides of the frontier, so to speak? Still further, Dr. Jung claims that one of the criteria or the chief criterion would be that feelings are unaccompanied by physiological change, whereas emotions are accompanied by such changes. Experiments conducted by Professor Freudlicher¹⁶ in Berlin have, I

think, shown clearly that simple feelings, in the sense of pleasure, pain, tension, and relaxation, are as a matter of fact accompanied by physiological changes, such as changes in the blood pressure, which can now be recorded by very accurate apparatus.

Professor Jung:

[58] It is true that feelings, if they have an emotional character, are accompanied by physiological effects; but there are definitely feelings which do not change the physiological condition. These feelings are very mental, they are not of an emotional nature. That is the distinction I make. Inasmuch as feeling is a function of values, you will readily understand that this is not a physiological condition. It can be something as abstract as abstract thinking. You would not expect abstract thinking to be a physiological condition. Abstract thinking is what the term denotes. Differentiated thinking is rational; and so feeling can be rational in spite of the fact that many people mix up the terminology.

[59] We must have a word for the giving of values. We must designate that particular function, as apart from others, and feeling is an apt term. Of course, you can choose any other word you like, only you must say so. I have absolutely no objection if the majority of thinking people come to the conclusion that feeling is a very bad word for it. If you say, "We prefer to use another term," then you must choose another term to designate the function of valuing, because the fact of values remains and we must have a name for it. Usually the sense of values is expressed by the term "feeling." But I do not cling to the term at all. I am absolutely liberal as to terms, only I give the definition of terms so that I can say what I mean when I use such and such a term. If anybody says that feeling is an emotion or that feeling is a thing that causes heightened blood pressure, I have no objection. I only say that I do not use the word in that sense. If people should agree that it ought to be forbidden to use the word feeling in such a way as I do, I have no objection. The Germans have the words *Empfindung* and *Gefühl*. When you read Goethe or Schiller you find that even the poets mix up the two functions. German psychologists have already recommended the suppression of the word *Empfindung* for feeling, and propose that one should use the word *Gefühl* (feeling) for values, while the word *Empfindung* should be used for sensation. No psychologist nowadays would say, "The feelings of my eyes or of my ears or of my skin." People of course say that they have feelings in their big toe or ear, but no scientific language of that kind is possible any more. Taking those two words as identical, one could express the most exalted moods by the word *Empfindung*, but it is exactly as if a Frenchman spoke of "les sensations les plus nobles de l'amour." People would laugh, you know. It would be absolutely impossible, shocking!

Dr. E. A. Bennet:

[60] Do you consider that the superior function in the case of a person suffering from manic-depression remains conscious during the period of depression?

Professor Jung:

[61] I would not say that. If you consider the case of manic-depressive insanity you occasionally find that in the manic phase one function prevails and in the depressive phase another function prevails. For instance, people who are lively, sanguine, nice and kind in the manic phase, and do not think very much, suddenly become very thoughtful when the depression comes on, and then they have obsessive thoughts, and vice versa. I know several cases of intellectuals who have a manic-depressive disposition. In the manic phase they think freely, they are productive and very clear and very abstract. Then the depressive phase comes on, and they have obsessive feelings; they are obsessed by terrible moods, just moods, not thoughts. Those are, of course, psychological details. You see these things most clearly in cases of men of forty and a little bit more who have led a particular type of life, an intellectual life or a life of values, and suddenly that thing goes under and up comes just the contrary. There are very interesting cases like that. We have the famous literary illustrations, Nietzsche for instance. He is a most impressive example of a change of psychology into its opposite at middle age. In younger years he was the aphorist in the French style; in later years, at 38, in *Thus Spake Zarathustra*, he burst out in a Dionysian mood which was absolutely the contrary of everything he had written before.

Dr. Bennet:

[62] Is melancholia not extraverted?

Professor Jung:

[63] You cannot say that, because it is an incommensurable consideration. Melancholia in itself could be termed an introverted condition but it is not an attitude of preference. When you call somebody an introvert, you mean that he prefers an introverted habit, but he has his extraverted side too. We all have both sides, otherwise we could not adapt at all, we would have no influence, we would be beside ourselves. Depression is always an introverted condition. Melancholies sink down into a sort of embryonic condition, therefore you find that accumulation of peculiar physical symptoms.

Dr. Mary C. Luff:

[64] As Professor Jung has explained emotion as an obsessive thing which possesses the individual, I am not clear how he differentiates what he calls “invasions” from “affects.”

Professor Jung:

[65] You experience sometimes what you call “pathological” emotions, and there you observe most peculiar contents coming through as emotion: thoughts you have never thought before, sometimes terrible thoughts and fantasies. For instance, some people when they are very angry, instead of having the ordinary feelings of revenge and so on, have the most terrific fantasies of committing murder, cutting off the arms and legs of the enemy, and such things. Those are invading fragments of the unconscious, and if you take a fully developed pathological emotion it is really a state of *eclipse* of consciousness when people are raving mad for a while and do perfectly crazy things. That is an invasion. That would be a pathological case, but fantasies of this kind can also occur within the limits of normal. I have heard innocent people say, “I could cut him limb from limb,” and they actually do have these bloody fantasies; they would “smash the brains” of people, they imagine *doing* what in cold blood is merely *said* as a metaphor. When these fantasies get vivid and people are afraid of themselves, you speak of invasion.

Dr. Luff:

[66] Is that what you call confusional psychosis?

Professor Jung:

[67] It does not need to be a psychosis at all. It does not need to be pathological; you can observe such things in normal people when they are under the sway of a particular emotion. I once went through a very strong earthquake. It was the first time in my life I experienced an earthquake. I was simply overcome by the idea that the earth was not solid and that it was the skin of a huge animal that had shaken itself as a horse does. I was simply caught by that idea for a while. Then I came out of the fantasy remembering that that is exactly what the Japanese say about earthquakes: that the big salamander has turned over or changed its position, the salamander that is carrying the earth.¹⁷ Then I was satisfied that it was an archaic idea which had jumped into my consciousness. I thought it was remarkable; I did not quite think it was pathological.

Dr. B. D. Hendy:

[68] Would Professor Jung say that affect, as he defined it, is *caused* by a characteristic physiological condition, or would he say that this physiological alteration is the *result* of, let us say, invasion?

Professor Jung:

[69] The relation between body and mind is a very difficult question. You know that the James-Lange theory says that affect is the result of physiological alteration. The question whether the body or the mind is the predominating factor will always be answered according to temperamental differences. Those who by temperament prefer the theory of the supremacy of the body will say that mental processes are epiphenomena of physiological chemistry. Those who believe more in the spirit will say the contrary, to them the body is just the appendix of the mind and causation lies with the spirit. It is really a philosophical question, and since I am not a philosopher I cannot claim to make a decision. All we can know empirically is that processes of the body and processes of the mind happen together in some way which is mysterious to us. It is due to our most lamentable mind that we cannot think of body and mind as one and the same thing; probably they *are* one thing, but we are unable to think it. Modern physics is subject to the same difficulty; look at the regrettable things which happen with light! Light behaves as if it were oscillations, and it also behaves as if it were "corpuscles." It needed a very complicated mathematical formula by M. de Broglie to help the human mind to conceive the possibility that oscillations and corpuscles are two phenomena, observed under different conditions, of one and the same ultimate reality.¹⁸ You cannot *think* this, but you are forced to admit it as a postulate.

[70] In the same way, the so-called psychophysical parallelism is an insoluble problem. Take for instance the case of typhoid fever with psychological concomitants. If the psychic factor were mistaken for a causation, you would reach preposterous conclusions. All we can say is that there are certain physiological conditions which are clearly caused by mental disorder, and certain others which are not caused but merely accompanied by psychic processes. Body and mind are the two aspects of the living being, and that is all we know. Therefore I prefer to say that the two things happen together in a miraculous way, and we had better leave it at that, because we cannot think of them together. For my own use I have coined a term to illustrate this being together; I say there is a peculiar principle of *synchronicity*¹⁹ active in the world so that things happen together somehow and behave as if they were the same, and yet for us they are not. Perhaps we shall some day discover a new kind of mathematical method by which we can prove that it must be like that. But for the time being I am absolutely unable to tell you whether it is the body or the mind that prevails, or whether they just coexist.

Dr. L. J. Bendit:

[71] I am not quite clear when invasion becomes pathological. You suggested in the first part of your talk this evening that invasion became pathological whenever it became habitual. What is the difference between a pathological invasion and an artistic inspiration and creation of ideas?

Professor Jung:

[72] Between an artistic inspiration and an invasion there is absolutely no difference. It is exactly the same, therefore I avoid the word "pathological." I would never say that artistic inspiration is pathological, and therefore I make that exception for invasions too, because I consider that an inspiration is a perfectly normal fact. There is nothing bad in it. It is nothing out of the ordinary. Happily enough it belongs to the order of human beings that inspiration takes place occasionally—very rarely, but it does. But it is quite certain that pathological things come in pretty much the same way, so we have to draw the line somewhere. If you are all alienists and I present to you a certain case, then you might say that that man is insane. I would say that that man is not insane for this reason, that as long as he can explain himself to me in such a way that I feel I have a contact with him that man is not crazy. To be crazy is a very relative conception. For instance, when a Negro behaves in a certain way we say, "Oh well, he's only a Negro," but if a white man behaves in the same way we say, "That man is crazy," because a white man cannot behave like that. A Negro is expected to do such things but a white man does not do them. To be "crazy" is a social concept; we use social restrictions and definitions in order to distinguish mental disturbances. You can say that a man is peculiar, that he behaves in an unexpected way and has funny ideas, and if he happens to live in a little town in France or Switzerland you would say, "He is an original fellow, one of the most original inhabitants of that little place"; but if you bring that man into the midst of Harley Street, well, he is plumb crazy. Or if a certain individual is a painter, you think he is a very original artist, but let that man be the cashier of a big bank and the bank will experience something. Then they will say that fellow is surely crazy. But these are simply social considerations. We see the same thing in lunatic asylums. It is not an absolute increase in insanity that makes our asylums swell like monsters, it is the fact that we cannot stand abnormal people any more, so there are apparently very many more crazy people than formerly. I remember in my youth we had people whom I recognized later on as being schizophrenic, and we thought, "Well, Uncle So-and-So is a very original man." In my native town we had some imbeciles, but one did not say, "He is a terrible ass," or something like that, but "He is very nice." In the same way one called certain idiots "cretins," which comes from the saying "il est

bon chrétien.” You could not say anything else of them, but at least they were good Christians.

The Chairman:

[73] Ladies and Gentlemen, I think we must let Professor Jung off any further activity for tonight, and we thank him very much indeed.

LECTURE II

The Chairman (Dr. J. A. Hadfield):

[74] Ladies and Gentlemen, you have already been introduced to Dr. Jung and that in the most eulogistic language, but I think all who were here last night will recognize that even such a great eulogy was in no sense exaggerated. Dr. Jung last night was referring to a number of the functions of the human mind, such as feeling, thinking, intuition, and sensation, and I could not help feeling that in him all these functions, contrary to what he told us, seemed to be very well differentiated. I also had a hunch that in him they were bound together in the centre by a sense of humour. Nothing convinces me so much of the truth of any conception as when its creator is able to see it as a subject of humour, and that is what Dr. Jung did last night. Over-seriousness in regard to any subject very often displays the fact that the individual is dubious and anxious about the truth of what he is trying to convey.

Professor Jung:

[75] Ladies and Gentlemen, yesterday we dealt with the functions of consciousness. Today I want to finish the problem of the structure of the mind. A discussion of the human mind would not be complete if we did not include the existence of unconscious processes. Let me repeat shortly the reflections which I made last night.

[76] We cannot deal with unconscious processes directly because they are not reachable. They are not directly apprehended; they appear only in their products, and we postulate from the peculiar quality of those products that there must be something behind them from which they originate. We call that dark sphere the unconscious psyche.

[77] The ectopsychic contents of consciousness derive in the first place from the environment, through the data of the senses.

Then the contents also come from other sources, such as memory and processes of judgment. These belong to the endopsychic sphere. A third source for conscious contents is the dark sphere of the mind, the unconscious. We approach it through the peculiarities of the endopsychic functions, those functions which are not under the control of the will. They are the vehicle by which unconscious contents reach the surface of consciousness.

[78] The unconscious processes, then, are not directly observable, but those of its products that cross the threshold of consciousness can be divided into two classes. The first class contains recognizable material of a definitely personal origin; these contents are individual acquisitions or products of instinctive processes that make up the personality as a whole. Furthermore, there are forgotten or repressed contents, and creative contents. There is nothing specially peculiar about them. In other people such things may be conscious. Some people are conscious of things of which other people are not. I call that class of contents the subconscious mind or the *personal unconscious*, because, as far as we can judge, it is entirely made up of personal elements, elements that constitute the human personality as a whole.

[79] Then there is another class of contents of definitely unknown origin, or at all events of an origin which cannot be ascribed to individual acquisition. These contents have one outstanding peculiarity, and that is their mythological character. It is as if they belong to a pattern not peculiar to any particular mind or person, but rather to a pattern peculiar to *mankind in general*. When I first came across such contents I wondered very much whether they might not be due to heredity, and I thought they might be explained by racial inheritance. In order to settle that question I went to the United States and studied the dreams of pure-blooded Negroes, and I was able to satisfy myself that these images have nothing to do with so-called blood or racial inheritance, nor are they personally acquired by the individual. They belong to mankind in general, and therefore they are of a *collective* nature.

[80] These collective patterns I have called *archetypes*, using an expression of St. Augustine's.¹ An archetype means a *typos* [imprint], a definite grouping of archaic character containing, in form as well as in meaning, *mythological motifs*. Mythological motifs appear in pure form in fairytales, myths, legends, and folklore. Some of the well-known motifs are: the figures of the Hero, the Redeemer, the Dragon (always connected with the Hero, who has to overcome him), the Whale or the Monster who swallows the Hero.² Another variation of the motif of the Hero and the Dragon is the Katabasis, the Descent into the Cave, the Nekyia. You remember in the *Odyssey* where Ulysses descends *ad inferos* to consult Tiresias, the seer. This motif of the Nekyia is found everywhere in antiquity and practically all over the world. It expresses the psychological mechanism of introversion of the conscious mind into the deeper layers of the unconscious psyche. From these layers derive the contents of an impersonal, mythological character, in other words, the archetypes, and I call them therefore the impersonal or *collective unconscious*.

[81] I am perfectly well aware that I can give you only the barest outline of this particular question of the collective unconscious. But I will give you an example of its symbolism and of how I proceed in order to discriminate it from the personal

unconscious. When I went to America to investigate the unconscious of Negroes I had in mind this particular problem: are these collective patterns racially inherited, or are they “a priori categories of imagination,” as two Frenchmen, Hubert and Mauss,³ quite independently of my own work, have called them. A Negro told me a dream in which occurred the figure of a man crucified on a wheel.⁴ I will not mention the whole dream because it does not matter. It contained of course its personal meaning as well as allusions to impersonal ideas, but I picked out only that one motif. He was a very uneducated Negro from the South and not particularly intelligent. It would have been most probable, given the well-known religious character of the Negroes, that he should dream of a man crucified on a *cross*. The cross would have been a personal acquisition. But it is rather improbable that he should dream of the man crucified on a *wheel*. That is a very uncommon image. Of course I cannot prove to you that by some curious chance the Negro had not seen a picture or heard something of the sort and then dreamt about it; but if he had not had any model for this idea it would be an *archetypal image*, because the crucifixion on the wheel is a *mythological motif*. It is the ancient sun-wheel, and the crucifixion is the sacrifice to the sun-god in order to propitiate him, just as human and animal sacrifices formerly were offered for the fertility of the earth. The sun-wheel is an exceedingly archaic idea, perhaps the oldest religious idea there is. We can trace it to the Mesolithic and Paleolithic ages, as the sculptures of Rhodesia prove. Now there were real wheels only in the Bronze Age; in the Paleolithic Age the wheel was not yet invented. The Rhodesian sun-wheel seems to be contemporary with very naturalistic animal-pictures, like the famous rhino with the tick-birds, a masterpiece of observation. The Rhodesian sun-wheel is therefore an original vision, presumably an archetypal sun-image.⁵ But this image is not a naturalistic one, for it is always divided into four or eight partitions (Figure 3). This image, a sort of divided circle, is a symbol which you find throughout the whole history of mankind as well as in the dreams of modern individuals. We might assume that the invention of the actual wheel started from this vision. Many of our inventions came from mythological anticipations and primordial images. For instance, the art of alchemy is the mother of modern chemistry. Our conscious scientific mind started in the matrix of the unconscious mind.

FIG. 3. Sun-wheel

[82] In the dream of the Negro, the man on the wheel is a repetition of the Greek mythological motif of Ixion, who, on account of his offence against men and gods, was fastened by Zeus upon an incessantly turning wheel. I give you this example of a mythological motif in a dream merely in order to convey to you an idea of the collective unconscious. One single example is of course no conclusive proof. But one cannot very well assume that this Negro had studied Greek mythology, and it is improbable that he had seen any representation of Greek mythological figures. Furthermore, figures of Ixion are pretty rare.

[83] I could give you conclusive proof of a very elaborate kind of the existence of these mythological patterns in the unconscious mind. But in order to present my material I should need to lecture for a fortnight. I would have first to explain to you the meaning of dreams and dream-series and then give you all the historical parallels and explain fully their importance, because the symbolism of these images and ideas is not taught in public schools or universities, and even specialists very rarely know of it. I had to study it for years and to find the material myself, and I cannot expect even a highly educated audience to be *au courant* with such abstruse matters. When we come to the technique of dream-analysis I shall be forced to enter into some of the mythological material and you will get a glimpse of what this work of finding parallels to unconscious products is really like. For the moment I have to content myself with the mere statement that there are mythological patterns in that layer of the unconscious, that it produces contents which cannot be ascribed to the individual and which may even be in strict contradiction to the personal psychology of the dreamer. For instance, you are simply astounded when you observe a completely uneducated person producing a dream which really should not occur with such a person because it contains the most amazing things. And children's dreams often make you think to such a degree that you must take a holiday afterwards in order to recover from the shock, because these symbols are so tremendously profound and you think: How on earth is it possible that a child should have such a dream?

[84] It is really quite simple to explain. Our mind has its history, just as our body has its history. You might be just as astonished that man has an appendix, for instance. Does he know he ought to have an appendix? He is just born with it. Millions of people do not know they have a thymus, but they have it. They do not know that in certain parts of their anatomy they belong to the species of the fishes, and yet it is so. Our unconscious mind, like our body, is a storehouse of relics and memories of the past. A study of the structure of the unconscious collective mind would reveal the same discoveries as you make in comparative anatomy. We do not need to think that there is anything mystical about it. But because I speak of a collective unconscious, I have been accused of obscurantism. There is nothing mystical about the collective unconscious. It is just a new branch of science, and it is really common sense to

admit the existence of unconscious collective processes. For, though a child is not born conscious, his mind is not a *tabula rasa*. The child is born with a definite brain, and the brain of an English child will work not like that of an Australian blackfellow but in the way of a modern English person. The brain is born with a finished structure, it will work in a modern way, but this brain has its history. It has been built up in the course of millions of years and represents a history of which it is the result. Naturally it carries with it the traces of that history, exactly like the body, and if you grope down into the basic structure of the mind you naturally find traces of the archaic mind.

[85] The idea of the collective unconscious is really very simple. If it were not so, then one could speak of a miracle, and I am not a miracle-monger at all. I simply go by experience. If I could tell you the experiences you would draw the same conclusions about these archaic motifs. By chance, I stumbled somehow into mythology and have read more books perhaps than you. I have not always been a student of mythology. One day, when I was still at the clinic, I saw a patient with schizophrenia who had a peculiar vision, and he told me about it. He wanted me to see it and, being very dull, I could not see it. I thought, "This man is crazy and I am normal and his vision should not bother me." But it did. I asked myself: What does it mean? I was not satisfied that it was just crazy, and later I came on a book by a German scholar, Dieterich,⁶ who had published part of a magic papyrus. I studied it with great interest, and on page 7 I found the vision of my lunatic "word for word." That gave me a shock. I said: "How on earth is it possible that this fellow came into possession of that vision?" It was not just one image, but a series of images and a literal repetition of them. I do not want to go into it now because it would lead us too far. It is a highly interesting case; as a matter of fact, I published it.⁷

[86] This astonishing parallelism set me going. You probably have not come across the book of the learned professor Dieterich, but if you had read the same books and observed such cases you would have discovered the idea of the collective unconscious.

[87] The deepest we can reach in our exploration of the unconscious mind is the layer where man is no longer a distinct individual, but where his mind widens out and merges into the mind of mankind—not the conscious mind, but the unconscious mind of mankind, where we are all the same. As the body has its anatomical conformity in its two eyes and two ears and one heart and so on, with only slight individual differences, so has the mind its basic conformity. On this collective level we are no longer separate individuals, we are all one. You can understand this when you study the psychology of primitives. The outstanding fact about the primitive mentality is this lack of distinctiveness between individuals, this oneness of the subject with the

object, this *participation mystique*, as Lévy-Bruhl⁸ terms it. Primitive mentality expresses the basic structure of the mind, that psychological layer which with us is the collective unconscious, that underlying level which is the same in all. Because the basic structure of the mind is the same in everybody, we cannot make distinctions when we experience on that level. There we do not know if something has happened to you or to me. In the underlying collective level there is a wholeness which cannot be dissected. If you begin to think about participation as a fact which means that fundamentally we are identical with everybody and everything, you are led to very peculiar theoretical conclusions. You should not go further than those conclusions because these things get dangerous. But some of the conclusions you should explore, because they can explain a lot of peculiar things that happen to man.

[88] I want to sum up: I have brought a diagram (Figure 4). It looks very complicated but as a matter of fact it is very simple. Suppose our mental sphere to look like a lighted globe. The surface from which the light emanates is the function by which you chiefly adapt. If you are a person who adapts chiefly by thinking, your surface is the surface of a thinking man. You will tackle things with your thinking, and what you will show to people will be your thinking. It will be another function if you are of another type.⁹

[89] In the diagram, *sensation* is given as the peripheral function. By it man gets information from the world of external objects. In the second circle, *thinking*, he gets what his senses have told him; he will give things a name. Then he will have a *feeling* about them; a feeling-tone will accompany his observation. And in the end he will get some consciousness of where a thing comes from, where it may go, and what it may do. That is *intuition*, by which you see round corners. These four functions form the ectopsychic system.

[90] The next circle in the diagram represents the conscious ego-complex to which the functions refer. Inside the endopsyché you first notice *memory*, which is still a function that can be controlled by the will; it is under the control of your ego-complex. Then we meet the *subjective components of the functions*. They cannot be exactly directed by the will but they still can be suppressed, excluded, or increased in intensity by will-power. These components are no longer as controllable as memory, though even memory is a bit tricky as you know. Then we come to the *affects* and *invasions*, which are only controllable by sheer force. You can suppress them, and that is all you can do. You have to clench your fists in order not to explode, because they are apt to be stronger than your ego-complex.

[91] This psychic system cannot really be expressed by such a crude diagram. The diagram is rather a scale of values showing how the energy or intensity of the ego-complex which manifests itself in will-power gradually decreases as you approach

the darkness that is ultimately at the bottom of the whole structure—the *unconscious*. First we have the personal subconscious mind. The *personal unconscious* is that part of the psyche which contains all the things that could just as well be conscious. You know that many things are termed unconscious, but that is only a relative statement. There is nothing in this particular sphere that is necessarily unconscious in everybody. There are people who are conscious of almost anything of which man can be conscious. Of course we have an extraordinary amount of unconsciousness in our civilization, but if you go to other races, to India or to China, for example, you discover that these people are conscious of things for which the psychoanalyst in our countries has to dig for months. Moreover, simple people in natural conditions often have an extraordinary consciousness of things of which people in towns have no knowledge and of which townspeople begin to dream only under the influence of psychoanalysis. I noticed this at school. I had lived in the country among peasants and with animals, and I was fully conscious of a number of things of which other boys had no idea. I had the chance and I was not prejudiced. When you analyse dreams or symptoms or fantasies of neurotic or normal people, you begin to penetrate the unconscious mind, and you can abolish its artificial threshold. The personal unconscious is really something very relative, and its circle can be restricted and become so much narrower that it touches zero. It is quite thinkable that a man can develop his consciousness to such an extent that he can say: *Nihil humanum a me alienum puto*.¹⁰

FIG. 4. The Psyche

[92] Finally we come to the ultimate kernel which cannot be made conscious at all—the sphere of the archetypal mind. Its presumable contents appear in the form of images which can be understood only by comparing them with historical parallels. If you do not recognize certain material as historical, and if you do not possess the parallels, you cannot integrate these contents into consciousness and they remain projected. The contents of the *collective unconscious* are not subject to any arbitrary intention and are not controllable by the will. They actually behave as if they did not exist in yourself—you see them in your neighbours but not in yourself. When the contents of the collective unconscious become activated, we become aware of certain things in our fellow men. For instance, we begin to discover that the bad Abyssinians are attacking Italy. You know the famous story by Anatole France. Two peasants were always fighting each other, and there was somebody who wanted to go into the reasons for it, and he asked one man, “Why do you hate your neighbour and fight him like this?” He replied, “Mais il est de l’autre côté de la rivière!” That is like France and Germany. We Swiss people, you know, had a very good chance during the Great War to read newspapers and to study that particular mechanism which behaved

like a great gun firing on one side of the Rhine and in exactly the same way on the other side, and it was very clear that people saw in their neighbours the thing they did not recognize in themselves.

[93] As a rule, when the collective unconscious becomes really constellated in larger social groups, the result is a public craze, a mental epidemic that may lead to revolution or war or something of the sort. These movements are exceedingly contagious—almost overwhelmingly contagious because, when the collective unconscious is activated, you are no longer the same person. You are not only in the movement—you *are* it. If you lived in Germany or were there for a while, you would defend yourself in vain. It gets under your skin. You are human, and wherever you are in the world you can defend yourself only by restricting your consciousness and making yourself as empty, as soulless, as possible. Then you lose your soul, because you are only a speck of consciousness floating on a sea of life in which you do not participate. But if you remain yourself you will notice that the collective atmosphere gets under your skin. You cannot live in Africa or any such country without having that country under your skin. If you live with the yellow man you get yellow under the skin. You cannot prevent it, because somewhere you are the same as the Negro or the Chinese or whoever you live with, you are all just human beings. In the collective unconscious you are the same as a man of another race, you have the same archetypes, just as you have, like him, eyes, a heart, a liver, and so on. It does not matter that his skin is black. It matters to a certain extent, sure enough—he has probably a whole historical layer less than you. The different strata of the mind correspond to the history of the races.

[94] If you study races as I have done you can make very interesting discoveries. You can make them, for instance, if you analyse North Americans. The American, on account of the fact that he lives on virgin soil, has the Red Indian in him. The Red man, even if he has never seen one, and the Negro, though he may be cast out and the tram-cars reserved for white men only, have got into the American and you will realize that he belongs to a partly coloured nation.¹¹ These things are wholly unconscious, and you can only talk to very enlightened people about them. It is just as difficult to talk to Frenchmen or Germans when you have to tell them why they are so much against each other.

[95] A little while ago I had a nice evening in Paris. Some very cultivated men had invited me, and we had a pleasant conversation. They asked me about national differences, and I thought I would put my foot in it, so I said: “What you value is *la clarté latine, la clarté de l’esprit latin*. That is because your thinking is inferior. The Latin thinker is inferior in comparison to the German thinker.” They cocked their ears, and I said: “But your feeling is unsurpassable, it is absolutely differentiated.”

They said: “How is that?” I replied: “Go to a café or a vaudeville or a place where you hear songs and stage-plays and you will notice a very peculiar phenomenon. There are any number of very grotesque and cynical things and then suddenly something sentimental happens. A mother loses her child, there is a lost love, or something marvellously patriotic, and you must weep. For you, the salt and the sugar have to go together. But a German can stand a whole evening of sugar only. The Frenchman must have some salt in it. You meet a man and say: *Enchanté de faire votre connaissance*. You are not *enchanté de faire sa connaissance* at all; you are really feeling: ‘Oh go to the devil.’ But you are not disturbed, nor is he. But do not say to a German: *Enchanté de faire votre connaissance*, because he will believe it. A German will sell you a pair of sock-suspenders and not only expect, as is natural, to be paid for it. He also expects to be loved for it.”

[96] The German nation is characterized by the fact that its feeling function is inferior, it is not differentiated. If you say that to a German he is offended. I should be offended too. He is very attached to what he calls “*Gemütlichkeit*.” A room full of smoke in which everybody loves everybody—that is *gemütlich* and that must not be disturbed. It has to be absolutely clear, just one note and no more. That is *la clarté germanique du sentiment*, and it is inferior. On the other hand, it is a gross offence to a Frenchman to say something paradoxical, because it is not clear. An English philosopher has said, “A superior mind is never quite clear.” That is true, and also superior feeling is never quite clear. You will only enjoy a feeling that is above board when it is slightly doubtful, and a thought that does not have a slight contradiction in it is not convincing.

[97] Our particular problem from now on will be: How can we approach the dark sphere of man? As I have told you, this is done by three methods of analysis: the word-association test, dream-analysis, and the method of active imagination. First of all I want to say something about *word-association tests*.¹² To many of you perhaps these seem old-fashioned, but since they are still being used I have to refer to them. I use this test now not with patients but with criminal cases.

[98] The experiment is made—I am repeating well-known things—with a list of say a hundred words. You instruct the test person to react with the first word that comes into his mind as quickly as possible after having heard and understood the stimulus word. When you have made sure that the test person has understood what you mean you start the experiment. You mark the time of each reaction with a stop-watch. When you have finished the hundred words you do another experiment. You repeat the stimulus words and the test person has to reproduce his former answers. In certain places his memory fails and reproduction becomes uncertain or faulty. These mistakes are important.

- [99] Originally the experiment was not meant for its present application at all; it was intended to be used for the study of mental association. That was of course a most Utopian idea. One can study nothing of the sort by such primitive means. But you can study something else when the experiment fails, when people make mistakes. You ask a simple word that a child can answer, and a highly intelligent person cannot reply. Why? That word has hit on what I call a complex, a conglomeration of psychic contents characterized by a peculiar or perhaps painful feeling-tone, something that is usually hidden from sight. It is as though a projectile struck through the thick layer of the *persona*¹³ into the dark layer. For instance, somebody with a money complex will be hit when you say: "To buy," "to pay," or "money." That is a disturbance of reaction.
- [100] We have about twelve or more categories of disturbance and I will mention a few of them so that you will get an idea of their practical value. The prolongation of the reaction time is of the greatest practical importance. You decide whether the reaction time is too long by taking the average mean of the reaction times of the test person. Other characteristic disturbances are: reaction with more than one word, against the instructions; mistakes in reproduction of the word; reaction expressed by facial expression, laughing, movement of the hands or feet or body, coughing, stammering, and such things; insufficient reactions like "yes" or "no"; not reacting to the real meaning of the stimulus word; habitual use of the same words; use of foreign languages—of which there is not a great danger in England, though with us it is a great nuisance; defective reproduction, when memory begins to fail in the reproduction experiment; total lack of reaction.
- [101] All these reactions are beyond the control of the will. If you submit to the experiment you are done for, and if you do not submit to it you are done for too, because one knows why you are unwilling to do so. If you put it to a criminal he can refuse, and that is fatal because one knows why he refuses. If he gives in he hangs himself. In Zurich I am called in by the Court when they have a difficult case; I am the last straw.
- [102] The results of the association test can be illustrated very neatly by a diagram (Figure 5). The height of the columns represents the actual reaction time of the test person. The dotted horizontal line represents the average mean of reaction times. The unshaded columns are those reactions which show no signs of disturbance. The shaded columns show disturbed reactions. In reactions 7, 8, 9, 10, you observe for instance a whole series of disturbances: the stimulus word at 7 was a critical one, and without the test person noticing it at all three subsequent reaction times are overlong on account of the perseveration of the reaction to the stimulus word. The test person was quite unconscious of the fact that he had an emotion. Reaction 13 shows an isolated disturbance, and in 16–20 the result is again a whole series of disturbances.

The strongest disturbances are in reactions 18 and 19. In this particular case we have to do with a so-called intensification of sensitiveness through the sensitizing effect of an unconscious emotion: when a critical stimulus word has aroused a perseverating emotional reaction, and when the next critical stimulus word happens to occur within the range of that perseveration, then it is apt to produce a greater effect than it would have been expected to produce if it had occurred in a series of indifferent associations. This is called the sensitizing effect of a perseverating emotion.

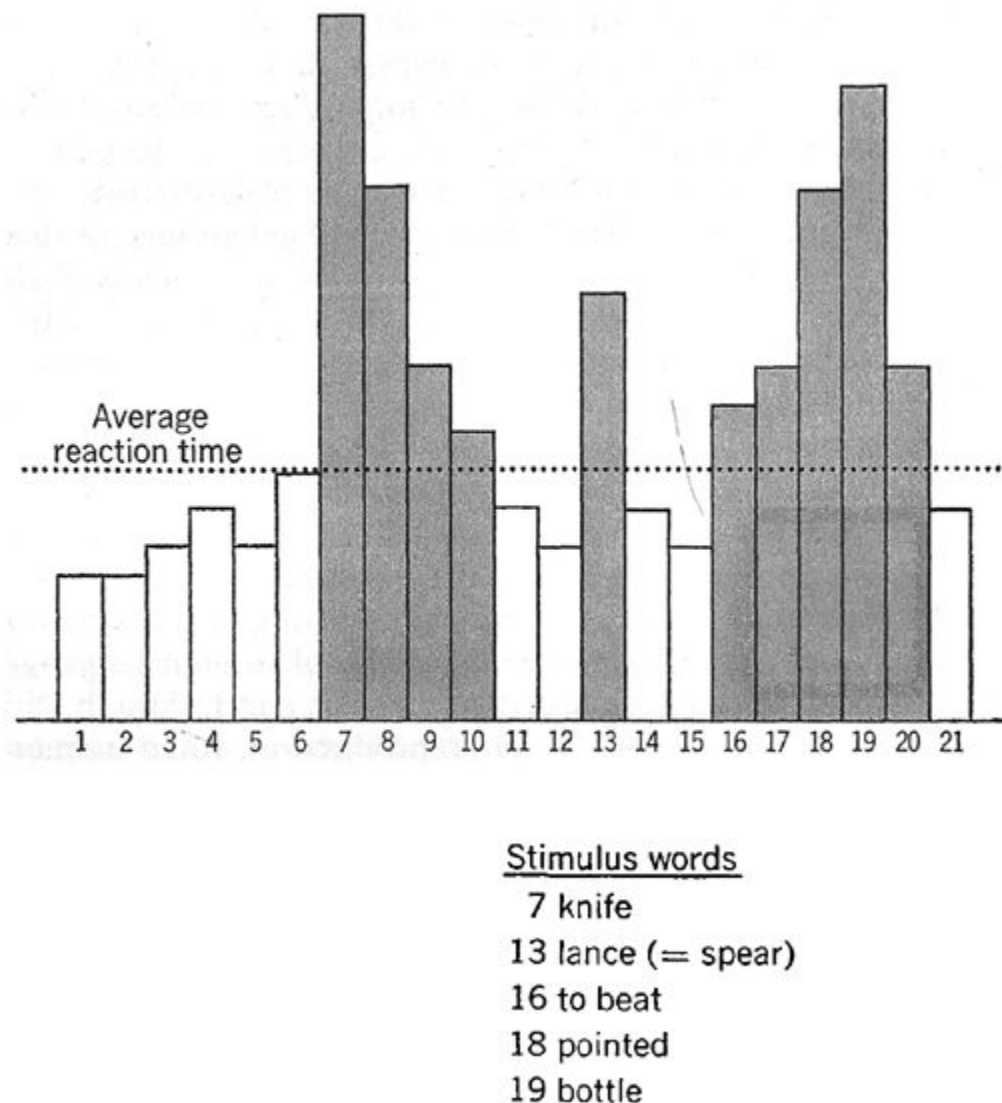

FIG. 5. Association Test

[103] In dealing with criminal cases we can make use of the sensitizing effect, and then we arrange the critical stimulus words in such a way that they occur more or less within the presumable range of perseveration. This can be done in order to increase the effect of critical stimulus words. With a suspected culprit as a test person, the critical stimulus words are words which have a direct bearing upon the crime.

[104] The test person for Figure 5 was a man about 35, a decent individual, one of my normal test persons. I had of course to experiment with a great number of normal people before I could draw conclusions from pathological material. If you want to know what it was that disturbed this man, you simply have to read the words that

caused the disturbances and fit them together. Then you get a nice story. I will tell you exactly what it was.

[105] To begin with, it was the word *knife* that caused four disturbed reactions. The next disturbance was *lance* (or *spear*) and then *to beat*, then the word *pointed* and then *bottle*. That was in a short series of fifty stimulus words, which was enough for me to tell the man point-blank what the matter was. So I said: "I did not know you had had such a disagreeable experience." He stared at me and said: "I do not know what you are talking about." I said: "You know you were drunk and had a disagreeable affair with sticking your knife into somebody." He said: "How do you know?" Then he confessed the whole thing. He came of a respectable family, simple but quite nice people. He had been abroad and one day got into a drunken quarrel, drew a knife and stuck it into somebody, and got a year in prison. That is a great secret which he does not mention because it would cast a shadow on his life. Nobody in his town or surroundings knows anything about it and I am the only one who by chance stumbled upon it. In my seminar in Zurich I also make these experiments. Those who want to confess are of course welcome to. However, I always ask them to bring some material of a person *they* know and *I* do not know, and I show them how to read the story of that individual. It is quite interesting work; sometimes one makes remarkable discoveries.

[106] I will give you other instances. Many years ago, when I was quite a young doctor, an old professor of criminology asked me about the experiment and said he did not believe in it. I said: "No, Professor? You can try it whenever you like." He invited me to his house and I began. After ten words he got tired and said: "What can you make of it? Nothing has come of it." I told him he could not expect a result with ten or twelve words; he ought to have a hundred and then we could see something. He said: "Can you do something with these words?" I said: "Little enough, but I can tell you something. Quite recently you have had worries about money, you have too little of it. You are afraid of dying of heart disease. You must have studied in France, where you had a love affair, and it has come back to your mind, as often, when one has thoughts of dying, old sweet memories come back from the womb of time." He said: "How do you know?" Any child could have seen it! He was a man of 72 and he had associated *heart* with *pain*—fear that he would die of heart failure. He associated *death* with *to die*—a natural reaction—and with *money* he associated *too little*, a very usual reaction. Then things became rather startling to me. To *pay*, after a long reaction time, he said *La Semeuse*, though our conversation was in German. That is the famous figure on the French coin. Now why on earth should this old man say *La Semeuse*? When he came to the word *kiss* there was a long reaction time and there was a light in his eyes and he said: *Beautiful*. Then of course I had the story. He would never have used French if it had not been associated with a particular feeling,

and so we must think why he used it. Had he had losses with the French franc? There was no talk of inflation and devaluation in those days. That could not be the clue. I was in doubt whether it was money or love, but when he came to *kiss/beautiful* I knew it was love. He was not the kind of man to go to France in later life, but he had been a student in Paris, a lawyer, probably at the Sorbonne. It was relatively simple to stitch together the whole story.

[107] But occasionally you come upon a real tragedy. Figure 6 is the case of a woman of about thirty years of age. She was in the clinic, and the diagnosis was schizophrenia of a depressive character. The prognosis was correspondingly bad. I had this woman in my ward, and I had a peculiar feeling about her. I felt I could not quite agree with the bad prognosis, because already schizophrenia was a relative idea with me. I thought that we are all relatively crazy, but this woman was peculiar, and I could not accept the diagnosis as the last word. In those days one knew precious little. Of course I made an anamnesis, but nothing was discovered that threw any light on her illness. Therefore I put her to the association test and finally made a very peculiar discovery. The first disturbance was caused by the word *angel*, and a complete lack of reaction by the word *obstinate*. Then there were *evil*, *rich*, *money*, *stupid*, *dear*, and *to marry*. Now this woman was the wife of a well-to-do man in a very fine position and apparently happy. I had questioned her husband, and the only thing he could tell me, as she also did, was that the depression came on about two months after her eldest child had died—a little girl four years old. Nothing else could be found out about the aetiology of the case. The association test confronted me with a most baffling series of reactions which I could not put together. You will often be in such a situation, particularly if you have no routine with that kind of diagnosis. Then you first ask the test person about the words which are not going directly to the kernel. If you asked directly about the strongest disturbances you would get wrong answers, so you begin with relatively harmless words and you are likely to get an honest reply. I said: “What about *angel*: Does that word mean something to you?” She replied: “Of course, that is my child whom I have lost.” And then came a great flood of tears. When the storm had blown over I asked: “What does *obstinate* mean to you?” She said: “It means nothing to me.” But I said: “There was a big disturbance with the word and it means there is something connected with it.” I could not penetrate it. I came to the word *evil* and could get nothing out of her. There was a severely negative reaction which showed that she refused to answer. I went on to *blue*, and she said: “Those are the eyes of the child I have lost.” I said: “Did they make a particular impression on you?” She said: “Of course. They were so wonderfully blue when the child was born.” I noticed the expression on her face, and I said: “Why are you upset?” and she replied: “Well, she did not have the eyes of my husband.” Finally it came out that the child had had the eyes of a former lover of

hers. I said: “What is upsetting you with regard to that man?” And I was able to worm the story out of her.

FIG. 6. Association Test

[108] In the little town in which she grew up there was a rich young man. She was of a well-to-do family but nothing grand. The man was of the moneyed aristocracy and the hero of the little town, and every girl dreamed of him. She was a pretty girl and thought she might have a chance. Then she discovered she had no chance with him, and her family said: “Why think of him? He is a rich man and does not think of you. Here is Mr. So-and-So, a nice man. Why not marry him?” She married him and was perfectly happy ever after until the fifth year of her marriage, when a former friend from her native town came to visit her. When her husband left the room he said to her: “You have caused pain to a certain gentleman” (meaning the hero). She said: “What? I caused pain?” The friend replied: “Didn’t you know he was in love with you and was disappointed when you married another man?” That set fire to the roof. But she repressed it. A fortnight later she was bathing her boy, two years, and her girl, four years old. The water in the town—it was not in Switzerland—was not above suspicion, in fact it was infected with typhoid fever. She noticed that the little girl was sucking a sponge. But she did not interfere, and when the little boy said, “I want to drink some water,” she gave him the possibly infected water. The little girl got typhoid fever and died, the little boy was saved. Then she had what she wanted—or what the devil in her wanted—the denial of her marriage in order to marry the other man. To this end she had committed murder. She did not know it; she only told me the facts and did not draw the conclusion that she was responsible for the death of the child since she knew the water was infected and there was danger. I was faced with the question whether I should tell her she had committed murder, or whether I should keep quiet. (It was only a question of telling *her*, there was no threat of a

criminal case.) I thought that if I told her it might make her condition much worse, but there was a bad prognosis anyhow, whereas, if she could realize what she had done, the chance was that she might get well. So I made up my mind to tell her point-blank: "You killed your child." She went up in the air in an emotional state, but then she came down to the facts. In three weeks we were able to discharge her, and she never came back. I traced her for fifteen years, and there was no relapse. That depression fitted her case psychologically: she was a murderess and under other circumstances would have deserved capital punishment. Instead of going to jail she was sent to the lunatic asylum. I practically saved her from the punishment of insanity by putting an enormous burden on her conscience. For if one can accept one's sin one can live with it. If one cannot accept it, one has to suffer the inevitable consequences.

Discussion

Question:

[109] I want to refer to last night. Towards the end of his lecture Dr. Jung spoke of higher and lower functions and said the thinking type would use his feeling function archaically. I would like to know: is the reverse true? Does the feeling type, when he tries to think, think archaically? In other words, are thinking and intuition to be regarded always as higher functions than feeling and sensation? I ask this because ... I gathered from lectures elsewhere that sensation was the lowest of conscious functions and thinking a higher one. It is certainly the case that in everyday life thinking seems to be the top-notch. The professor—not this Professor—thinking in his study regards himself and is regarded as the highest type, higher than the countryman who says: “Sometimes I sits and thinks and sometimes I just sits.”

Professor Jung:

[110] I hope I did not give you the impression that I was giving a preference to any of the functions. The dominating function in a given individual is always the most differentiated, and that can be *any* function. We have absolutely no criterion by which we can say this or that function in itself is the best. We can only say that the differentiated function in the individual is the best for adapting, and that the one that is most excluded by the superior function is inferior on account of being neglected. There are some modern people who say that intuition is the highest function. Fastidious individuals prefer intuition, it is classy! The sensation type always thinks that other people are very inferior because they are not so real as he is. He is the real fellow and everybody else is fantastic and unreal. Everybody thinks his superior function is the top of the world. In that respect we are liable to the most awful blunders. To realize the actual order of functions in our consciousness, severe psychological criticism is needed. There are many people who believe that world problems are settled by thinking. But no truth can be established without all four functions. When you have thought the world you have done one-fourth of it; the remaining three-fourths may be against you.

Dr. Eric B. Strauss:

[111] Professor Jung said the word-association test was a means by which one could study the contents of the personal unconscious. In the examples he gave surely the matters revealed were matters in the patient's conscious mind and not in his

unconscious. Surely if one wanted to seek for unconscious material one would have to go a step further and get the patient to associate freely on the anomalous reactions. I am thinking of the association with the word “knife,” when Professor Jung so cleverly assumed the story of the unfortunate incident. That surely was in the patient’s conscious mind, whereas, if the word “knife” had unconscious associations we might, if we were Freudian-minded, have assumed it was associated with an unconscious castration complex or something of that kind. I am not saying it is so, but I do not understand what Professor Jung means when he says the association test is to reach to the patient’s unconscious. Surely in the instance given tonight it is used to reach the conscious, or what Freud would perhaps call the preconscious.

Professor Jung:

[112] I should like very much if you would pay more attention to what I say. I told you that unconscious things are very *relative*. When I am unconscious of a certain thing I am only relatively unconscious of it; in some other respects I may know it. The contents of the personal unconscious are perfectly conscious in certain respects, but you do not know them under a *particular aspect* or at a *particular time*.

[113] How can you establish whether the thing is conscious or unconscious? You simply ask people. We have no other criterion to establish whether something is conscious or unconscious. You ask: “Do you know whether you have had certain hesitations?” They say: “No, I had no hesitation; to my knowledge I had the same reaction time.” “Are you conscious that something disturbed you?” “No, I am not.” “Have you no recollection of what you answered to the word ‘knife’?” “None at all.” This unawareness of facts is a very common thing. When I am asked if I know a certain man I may say no, because I have no recollection of him and so I am not conscious of knowing him; but when I am told that I met him two years ago, that he is Mr. So-and-So who has done such and such a thing, I reply: “Certainly I know him.” I know him and I do not know him. All the contents of the personal unconscious are *relatively* unconscious, even the castration complex and the incest complex. They are perfectly known under certain aspects, though they are unconscious under others. This relativity of being conscious of something becomes quite plain in hysterical cases. Quite often you find that things which seem unconscious are unconscious only to the doctor but not perhaps to the nurse or the relatives.

[114] I had to see an interesting case once in a famous clinic in Berlin, a case of multiple sarcomatosis of the spinal cord, and because it was a very famous neurologist who had made the diagnosis I almost trembled, but I asked for the anamnesis and had a very nice one worked out. I asked when the symptoms began, and found it was the evening of the day when the only son of the woman had left her

and married. She was a widow, quite obviously in love with her son, and I said: "This is no sarcomatosis but an ordinary hysteria, which we can prove presently." The professor was horrified at my lack of intelligence or tact or I don't know what, and I had to walk out. But somebody ran after me in the street. It was the nurse, who said: "Doctor, I want to thank you for saying that it *was* hysteria. I always thought so."

Dr. Eric Graham Howe:

[115] May I return to what Dr. Strauss said? Last night Professor Jung reproved me for merely using words, but I think it is important to get these words clearly understood. I wonder if you have ever asked for the association experiment to be applied to the words "mystic" or "fourth dimension"? I believe you would get a period of great delay and concentrated fury every time they were mentioned. I propose to return to the fourth-dimensional, because I believe it is a link badly needed to help our understanding. Dr. Strauss uses the word "unconscious," but I understand from Professor Jung that there is no such thing, there is only a relative unconsciousness which depends on a relative degree of consciousness. According to Freudians, there is a place, a thing, an entity called the unconscious. According to Professor Jung, as I understand him, there is no such thing. He is moving in a fluid medium of relationship and Freud in a static medium of unrelated entities. To get it clear Freud is *three-dimensional* and Jung is, in all his psychology, *four-dimensional*. For this reason, I would criticize if I may the whole diagrammatic system of Jung because he is giving you a three-dimensional presentation of a four-dimensional system, a static presentation of something that is functionally moving, and unless it is explained you get it confused with the Freudian terminology and you cannot understand it. I shall insist that there must be some clarification of words.

Professor Jung:

[116] I could wish Dr. Graham Howe were not so indiscreet. You are right, but you should not say such things. As I explained, I tried to begin with the mildest propositions. You put your foot right into it and speak of four dimensions and of the word "mystic," and you tell me that all of us would have a long reaction time to such stimulus words. You are quite right, everybody would be stung because we are just beginners in our field. I agree with you that it is very difficult to let psychology be a living thing and not to dissolve it into static entities. Naturally you must express yourself in terms of the fourth dimension when you bring the time factor into a three-dimensional system. When you speak of dynamics and processes you need the time factor, and then you have all the prejudice of the world against you because you have used the word "four-dimensional." It is a taboo word that should not be mentioned. It has a history, and we should be exceedingly tactful with such words. The more you

advance in the understanding of the psyche the more careful you will have to be with terminology, because it is historically coined and prejudiced. The more you penetrate the basic problems of psychology the more you approach ideas which are philosophically, religiously, and morally prejudiced. Therefore certain things should be handled with the utmost care.

Dr. Howe:

[117] This audience would like you to be provocative. I am going to say a rash thing. You and I do not regard the shape of the ego as a straight line. We would be prepared to regard the sphere as a true shape of the self in four dimensions, of which one is the three-dimensional outline. If so, will you answer a question: "What is the scope of that self which in four dimensions is a moving sphere?" I suggest the answer is: "The universe itself, which includes your concept of the collective racial unconscious."

Professor Jung:

[118] I should be much obliged if you would repeat that question.

Dr. Howe:

[119] How big is this sphere, which is the four-dimensional self? I could not help giving the answer and saying that it is the same bigness as the universe.

Professor Jung:

[120] This is really a philosophical question, and to answer it requires a great deal of theory of cognition. The world is our picture. Only childish people imagine that the world is what we think it is. The image of the world is a projection of the world of the self, as the latter is an introjection of the world. But only the special mind of a philosopher will step beyond the ordinary picture of the world in which there are static and isolated things. If you stepped beyond that picture you would cause an earthquake in the ordinary mind, the whole cosmos would be shaken, the most sacred convictions and hopes would be upset, and I do not see why one should wish to disquiet things. It is not good for patients, nor for doctors: it is perhaps good for philosophers.

Dr. Ian Suttie:

[121] I should like to go back to Dr. Strauss's question. I can understand what Dr. Strauss means and I think I can understand what Professor Jung means. As far as I can see, Professor Jung fails to make any link between his statement and Dr.

Strauss's. Dr. Strauss wanted to know how the word-association test can show the Freudian unconscious, the material that is actually pushed out of mind. As far as I understand Professor Jung, he means what Freud means by the "Id." It seems to me that we should define our ideas well enough to compare them and not merely use them, each in our own school.

Professor Jung:

[122] I must repeat again that my methods do not discover *theories*, they discover *facts*, and I tell you what facts I discover with these methods. I cannot discover a castration complex or a repressed incest or something like that—I find only psychological *facts*, not theories. I am afraid you mix up too much theory with fact and you are perhaps disappointed that the experiments do not reveal a castration complex and such things, but a castration complex is a *theory*. What you find in the association method are definite facts which we did not know before and which the test person also did not know in this particular light. I do not say he did not know it under another light. You know many things when you are in your business that you do not know at home, and at home you know many things that you do not know in your official position. Things are known in one place and somewhere else they are not known. That is what we call unconscious. I must repeat that we cannot penetrate the unconscious *empirically* and then discover, for instance, the Freudian *theory* of the castration complex. The castration complex is a mythological idea, but it is not found as such. What we actually find are certain facts grouped in a specific way, and we name them according to mythological or historical parallels. You cannot find a mythological motif, you can only find a personal motif, and that never appears in the form of a theory but as a living fact of human life. You can abstract a theory from it, Freudian or Adlerian or any other. You can think what you please about the facts of the world, and there will be as many theories in the end as heads that think about it.

Dr. Suttie:

[123] I protest! I am not interested in this or that theory or what facts are found or not, but I am interested in having a means of communication by which each can know what the others are thinking and for that end I hold that our conceptions must be defined. We must know what the other person means by a certain thing like the unconscious of Freud. As for the word "unconscious," it is becoming more or less known to everybody. It has therefore a certain social or illustrative value, but Jung refuses to recognize the word "unconscious" in the meaning Freud gives to it and uses "unconscious" in a way that we have come to consider as what Freud calls the "Id."

Professor Jung:

[124] The word “unconscious” is not Freud’s invention. It was known in German philosophy long before, by Kant and Leibniz and others, and each of them gives his definition of that term. I am perfectly well aware that there are many different conceptions of the unconscious, and what I was trying humbly to do was to say what *I* think about it. It is not that I undervalue the merits of Leibniz, Kant, von Hartmann, or any other great man, including Freud and Adler and so on. I was only explaining what *I* mean by the unconscious, and I presuppose that you are all aware of what Freud means by it. I did not think it was my task to explain things in such a way that somebody who is convinced of Freud’s theory and prefers that point of view would be upset in his belief. I have no tendency to destroy your convictions or points of view. I simply exhibit my own point of view, and if anybody should be tempted to think that this also is reasonable, that is all I want. It is perfectly indifferent to me what one thinks about the unconscious in general, otherwise I should begin a long dissertation on the concept of the unconscious as understood by Leibniz, Kant, and von Hartmann.

Dr. Suttie:

[125] Dr. Strauss asked about the relationship of the unconscious as conceived by you and by Freud. Is it possible to bring them into precise and definite relationship?

Professor Jung:

[126] Dr. Graham Howe has answered the question. Freud is seeing the mental processes as static, while I speak in terms of dynamics and relationship. To me all is relative. There is nothing definitely unconscious; it is only not present to the conscious mind under a certain light. You can have very different ideas of why a thing is known under one aspect and not known under another aspect. The only exception I make is the mythological pattern, which is profoundly unconscious, as I can prove by the facts.

Dr. Strauss:

[127] Surely there is a difference between using your association test as a crime detector and for finding, let us say, unconscious guilt. Your criminal is conscious of his guilt and he is conscious that he is afraid of its being discovered. Your neurotic is unaware of his guilt and unaware that he is afraid of his guilt. Can the same kind of technique be used in these two very different kinds of cases?

The Chairman:

[128] This woman was not conscious of her guilt though she had allowed the child to suck the sponge.

Professor Jung:

[129] I will show you the difference experimentally. In Figure 7 you have a short illustration of respiration during the association test. You see four series of seven respirations registered after the stimulus words. The diagrams are condensations of respirations after indifferent and critical stimulus words in a greater number of test persons.

[130] "A" gives respirations after indifferent stimulus words. The first inspirations after the stimulus words are restricted, while the following inspirations are of normal size.

[131] In "B" where the stimulus word was a critical one the volume of breathing is definitely restricted, sometimes by more than half the normal size.

[132] In "C" we have the behaviour of breathing after a stimulus word relating to a complex that was conscious to the test persons. The first inspiration is almost normal, and only later you find a certain restriction.

[133] In "D" the respiration is after a stimulus word that was related to a complex of which the test persons were unconscious. In this case the first inspiration is remarkably small and the following are rather below normal.

[134] These diagrams illustrate very clearly the difference of reaction between conscious and unconscious complexes. In "C," for instance, the complex is conscious. The stimulus word hits the test person, and there is a deep inspiration. But when the stimulus word hits an unconscious complex, the volume of breathing is restricted, as shown in "D" I. There is a spasm in the thorax, so that almost no breathing takes place. In that way one has empirical proof of the physiological difference between conscious and unconscious reaction.¹⁴

FIG. 7. Association Test Respiration

Dr. Wilfred R. Bion:

[135] You gave an analogy between archaic forms of the body and archaic forms of the mind. Is it purely an analogy or is there in fact a closer relationship? Last night you said something which suggested that you consider there is a connection between the mind and the brain, and there has lately been published in the *British Medical Journal* a diagnosis of yours from a dream of a physical disorder.¹⁵ If that case was correctly reported it makes a very important suggestion, and I wondered whether you considered there was some closer connection between the two forms of archaic survival.

Professor Jung:

[136] You touch again on the controversial problem of psychophysical parallelism for which I know of no answer, because it is beyond the reach of man's cognition. As I tried to explain yesterday, the two things—the psychic fact and the physiological fact—come together in a peculiar way. They happen together and are, so I assume,

simply two different aspects to our *mind*, but not in reality. We see them as two on account of the utter incapacity of our mind to think them together. Because of that possible unity of the two things, we must expect to find dreams which are more on the physiological side than on the psychological, as we have other dreams that are more on the psychological than on the physical side. The dream to which you refer was very clearly a representation of an organic disorder. These “organic representations” are well known in ancient literature. The doctors of antiquity and of the Middle Ages used dreams for their diagnosis. I did not conduct a physical examination on the man you refer to. I only heard his history and was told the dream, and I gave my opinion on it. I have had other cases, for instance a very doubtful case of progressive muscular atrophy in a young girl. I asked about dreams and she had two dreams which were very colourful. A colleague, a man who knew something of psychology, thought it might be a case of hysteria. There were indeed hysterical symptoms, and it was still doubtful if it was progressive muscular atrophy or not; but on account of the dreams I came to the conclusion that it must be an organic disease, and the end proved my diagnosis. It was an organic disturbance, and the dreams were definitely referring to the organic condition.¹⁶ According to my idea of the community of the psyche and the living body it should be like that, and it would be marvellous if it were not so.

Dr. Bion:

[137] Will you be talking of that later when you speak on dreams?

Professor Jung:

[138] I am afraid that I cannot go into such detail; it is too special. It is really a matter of special experience, and its presentation would be a very difficult job. It would not be possible to describe to you briefly the criteria by which I judge such dreams. The dream you mentioned, you may remember, was a dream of the little mastodon. To explain what that mastodon really means in an organic respect and why I must take that dream as an organic symptom would start such an argument that you would accuse me of the most terrible obscurantism. These things really are obscure. I had to speak in terms of the basic mind, which thinks in archetypal patterns. When I speak of archetypal patterns those who are aware of these things understand, but if you are not aware you think, “This fellow is absolutely crazy because he talks of mastodons and their difference from snakes and horses.” I should have to give you a course of about four semesters about symbology first so that you could appreciate what I said.

[139] That is the great trouble: there is such a gap between what is usually known of these things and what I have worked on all these years. If I were to speak of this even

before a medical audience I should have to talk of the peculiarities of the *niveau mental*, to quote Janet, and I might as well talk Chinese. For instance, I would say that the *abaissement du niveau mental* sank in a certain case to the level of the *manipura chakra*,¹⁷ that is, to the level of the navel. We Europeans are not the only people on the earth. We are just a peninsula of Asia, and on that continent there are old civilizations where people have trained their minds in introspective psychology for thousands of years, whereas we began with our psychology not even yesterday but only this morning. These people have an insight that is simply fabulous, and I had to study Eastern things to understand certain facts of the unconscious. I had to go back to understand Oriental symbolism. I am about to publish a little book on one symbolic motif only,¹⁸ and you will find it hair-raising. I had to study not only Chinese and Hindu but Sanskrit literature and medieval Latin manuscripts which are not even known to specialists, so that one must go to the British Museum to find the references. Only when you possess that apparatus of parallelism can you begin to make diagnoses and say that this dream is organic and that one is not. Until people have acquired that knowledge I am just a sorcerer. They say it is *un tour de passe-passe*. They said it in the Middle Ages. They said, "How can you see that Jupiter has satellites?" If you reply that you have a telescope, what is a telescope to a medieval audience?

[140] I do not mean to boast about this. I am always perplexed when my colleagues ask: "How do you establish such a diagnosis or come to this conclusion?" I reply: "I will explain if you will allow me to explain what you ought to know to be able to understand it." I experienced this myself when the famous Einstein was Professor at Zurich. I often saw him, and it was when he was beginning to work on his theory of relativity. He was often in my house, and I pumped him about his relativity theory. I am not gifted in mathematics and you should have seen all the trouble the poor man had to explain relativity to me. He did not know how to do it. I went fourteen feet deep into the floor and felt quite small when I saw how he was troubled. But one day he asked me something about psychology. Then I had my revenge.

[141] Special knowledge is a terrible disadvantage. It leads you in a way too far, so that you cannot explain any more. You must allow me to talk to you about seemingly elementary things, but if you will accept them I think you will understand why I draw such and such conclusions. I am sorry that we do not have more time and that I cannot tell you everything. When I come to dreams I have to give myself away and to risk your thinking me a perfect fool, because I am not able to put before you all the historical evidence which led to my conclusions. I should have to quote bit after bit from Chinese and Hindu literature, medieval texts and all the things which you do not know. How could you? I am working with specialists in other fields of knowledge and they help me. There was my late friend Professor Wilhelm, the

sinologist; I worked with him. He had translated a Taoist text, and he asked me to comment on it, which I did from the psychological side.¹⁹ I am a terrible novelty to a sinologist, but what he has to tell us is a novelty to us. The Chinese philosophers were no fools. We think the old people were fools, but they were as intelligent as we are. They were frightfully intelligent people, and psychology can learn no end from old civilizations, particularly from India and China. A former President of the British Anthropological Society asked me: "Can you understand that such a highly intelligent people as the Chinese have no science?" I replied: "They have a science, but you do not understand it. It is not based on the principle of causality. The principle of causality is not the only principle; it is only relative."

[142] People may say: What a fool to say causality is only relative! But look at modern physics! The East bases its thinking and its evaluation of facts on another principle. We have not even a word for that principle. The East naturally has a word for it, but we do not understand it. The Eastern word is *Tao*. My friend McDougall²⁰ has a Chinese student, and he asked him: "What exactly do you mean by Tao?" Typically Western! The Chinese explained what Tao is and he replied: "I do not understand yet." The Chinese went out to the balcony and said: "What do you see?" "I see a street and houses and people walking and tramcars passing." "What more?" "There is a hill." "What more?" "Trees." "What more?" "The wind is blowing." The Chinese threw up his arms and said: "That is Tao."

[143] There you are. Tao can be anything. I use another word to designate it, but it is poor enough. I call it *synchronicity*. The Eastern mind, when it looks at an ensemble of facts, accepts that ensemble as it is, but the Western mind divides it into entities, small quantities. You look, for instance, at this present gathering of people, and you say: "Where do they come from? Why should they come together?" The Eastern mind is not at all interested in that. It says: "What does it *mean* that these people are together?" That is not a problem for the Western mind. You are interested in what you come here for and what you are doing here. Not so the Eastern mind; it is interested in being together.

[144] It is like this: you are standing on the sea-shore and the waves wash up an old hat, an old box, a shoe, a dead fish, and there they lie on the shore. You say: "Chance, nonsense!" The Chinese mind asks: "What does it mean that these things are together?" The Chinese mind experiments with that *being together* and *coming together at the right moment*, and it has an experimental method which is not known in the West, but which plays a large role in the philosophy of the East. It is a method of forecasting possibilities, and it is still used by the Japanese Government about political situations; it was used, for instance, in the Great War. This method was formulated in 1143 B.C.²¹

LECTURE III

The Chairman (Dr. Maurice B. Wright):

[145] Ladies and Gentlemen, it is my privilege to be the Chairman at Professor Jung's lecture at this evening's meeting. It was my privilege twenty-one years ago to meet Professor Jung when he came over to London to give a series of addresses,¹ but there was then a very small group of psychologically minded physicians. I remember very well how after the meetings we used to go to a little restaurant in Soho and talk until we were turned out. Naturally we were trying to pump Professor Jung as hard as we could. "When I said goodbye to Professor Jung he said to me—he did not say it very seriously—"I think you are an extravert who has become an introvert." Frankly, I have been brooding about that ever since!

[146] Now, ladies and gentlemen, just a word about last night. I think Professor Jung gave us a very good illustration of his views and of his work when he talked about the value of the telescope. A man with a telescope naturally can see a good deal more than anybody with unaided sight. That is exactly Professor Jung's position. With his particular spectacles, with his very specialized research, he has acquired a knowledge, a vision of the depth of the human psyche, which for many of us is very difficult to grasp. Of course, it will be impossible for him in the space of a few lectures to give us more than a very short outline of the vision he has gained. Therefore, in my opinion anything which might seem blurred or dark is not a question of obscurantism, it is a question of spectacles. My own difficulty is that, with my muscles of accommodation already hardening, it might be impossible for me ever to see that vision clearly, even if for the moment Professor Jung could lend me his spectacles. But however this may be, I know that we are all thrilled with everything he can tell us, and we know how stimulating it is to our own thinking, especially in a domain where speculation is so easy and where proof is so difficult.

Professor Jung:

[147] Ladies and Gentlemen, I ought to have finished my lecture on the association tests yesterday, but I would have had to overstep my time. So you must pardon me for coming back to the same thing once more. It is not that I am particularly in love with the association tests. I use them only when I must, but they are really the foundation of certain conceptions. I told you last time about the characteristic

disturbances, and I think it would be a good thing, perhaps, if I were briefly to sum up all there is to say about the results of the experiment, namely about the complexes.

[148] A complex is an agglomeration of associations—a sort of picture of a more or less complicated psychological nature—sometimes of traumatic character, sometimes simply of a painful and highly toned character. Everything that is highly toned is rather difficult to handle. If, for instance, something is very important to me, I begin to hesitate when I attempt to do it, and you have probably observed that when you ask me difficult questions I cannot answer them immediately because the subject is important and I have a long reaction time. I begin to stammer, and my memory does not supply the necessary material. Such disturbances are complex disturbances—even if what I say does not come from a personal complex of mine. It is simply an important affair, and whatever has an intense feeling-tone is difficult to handle because such contents are somehow associated with physiological reactions, with the processes of the heart, the tonus of the blood vessels, the condition of the intestines, the breathing, and the innervation of the skin. Whenever there is a high tonus it is just as if that particular complex had a body of its own, as if it were localized in my body to a certain extent, and that makes it unwieldy, because something that irritates my body cannot be easily pushed away because it has its roots in my body and begins to pull at my nerves. Something that has little tonus and little emotional value can be easily brushed aside because it has no roots. It is not adherent or adhesive.

[149] Ladies and Gentlemen, that leads me to something very important—the fact that a complex with its given tension or energy has the tendency to form a little personality of itself. It has a sort of body, a certain amount of its own physiology. It can upset the stomach. It upsets the breathing, it disturbs the heart—in short, it behaves like a partial personality. For instance, when you want to say or do something and unfortunately a complex interferes with this intention, then you say or do something different from what you intended. You are simply interrupted, and your best intention gets upset by the complex, exactly as if you had been interfered with by a human being or by circumstances from outside. Under those conditions we really are forced to speak of the tendencies of complexes to act as if they were characterized by a certain amount of will-power. When you speak of will-power you naturally ask about the ego. Where then is the ego that belongs to the will-power of the complexes? We know our own ego-complex, which is supposed to be in full possession of the body. It is not, but let us assume that it is a centre in full possession of the body, that there is a focus which we call the ego, and that the ego has a will and can do something with its components. The ego also is an agglomeration of highly toned contents, so that in principle there is no difference between the ego-complex and any other complex.

[150] Because complexes have a certain will-power, a sort of ego, we find that in a schizophrenic condition they emancipate themselves from conscious control to such an extent that they become visible and audible. They appear as visions, they speak in voices which are like the voices of definite people. This personification of complexes is not in itself necessarily a pathological condition. In dreams, for instance, our complexes often appear in a personified form. And one can train oneself to such an extent that they become visible or audible also in a waking condition. It is part of a certain yoga training to split up consciousness into its components, each of which appears as a specific personality. In the psychology of our unconscious there are typical figures that have a definite life of their own.²

[151] All this is explained by the fact that the so-called unity of consciousness is an illusion. It is really a wish-dream. We like to think that we are one; but we are not, most decidedly not. We are not really masters in our house. We like to believe in our will-power and in our energy and in what we can do; but when it comes to a real show-down we find that we can do it only to a certain extent, because we are hampered by those little devils the complexes. Complexes are autonomous groups of associations that have a tendency to move by themselves, to live their own life apart from our intentions. I hold that our personal unconscious, as well as the collective unconscious, consists of an indefinite, because unknown, number of complexes or fragmentary personalities.

[152] This idea explains a lot. It explains, for instance, the simple fact that a poet has the capacity to dramatize and personify his mental contents. When he creates a character on the stage, or in his poem or drama or novel, he thinks it is merely a product of his imagination; but that character in a certain secret way has made itself. Any novelist or writer will deny that these characters have a psychological meaning, but as a matter of fact you know as well as I do that they have one. Therefore you can read a writer's mind when you study the characters he creates.

[153] The complexes, then, are partial or fragmentary personalities. When we speak of the ego-complex, we naturally assume that it has a consciousness, because the relationship of the various contents to the centre, in other words to the ego, is called consciousness. But we also have a grouping of contents about a centre, a sort of nucleus, in other complexes. So we may ask the question: Do complexes have a consciousness of their own? If you study spiritualism, you must admit that the so-called spirits manifested in automatic writing or through the voice of a medium do indeed have a sort of consciousness of their own. Therefore unprejudiced people are inclined to believe that the spirits are the ghosts of a deceased aunt or grandfather or something of the kind, just on account of the more or less distinct personality which can be traced in these manifestations. Of course, when we are dealing with a case of

insanity we are less inclined to assume that we have to do with ghosts. We call it pathological then.

[154] So much about the complexes. I insist on that particular point of consciousness within complexes only because complexes play a large role in dream-analysis. You remember my diagram (Figure 4) showing the different spheres of the mind and the dark centre of the unconscious in the middle. The closer you approach that centre, the more you experience what Janet calls an *abaissement du niveau mental*: your conscious autonomy begins to disappear, and you get more and more under the fascination of unconscious contents. Conscious autonomy loses its tension and its energy, and that energy reappears in the increased activity of unconscious contents. You can observe this process in an extreme form when you carefully study a case of insanity. The fascination of unconscious contents gradually grows stronger and conscious control vanishes in proportion until finally the patient sinks into the unconscious altogether and becomes completely victimized by it. He is the victim of a new autonomous activity that does not start from his ego but starts from the dark sphere.

[155] In order to deal with the association test thoroughly, I must mention an entirely different experiment. You will forgive me if for the sake of economizing time I do not go into the details of the researches, but these diagrams (Figs. 8, 9, 10, 11) illustrate the results of very voluminous researches into families.³ They represent the quality of associations. For instance, the little summit in Figure 8 designated as number XI is a special class or category of association. The principle of classification is logical and linguistic. I am not going into this, and you will simply have to accept the fact that I have made fifteen categories into which I divide associations. We made tests with a great number of families, all for certain reasons uneducated people, and we found that the type of association and reaction is peculiarly parallel among certain members of the family; for instance, father and mother, or two brothers, or mother and child are almost identical in their type of reaction.

[156] I shall explain this by Figure 8. The dotted line (.....) represents the mother, the broken line (-----) her sixteen-year-old daughter, and the unbroken line (-) the father. This was a very unfortunate marriage. The father was an alcoholic and the mother was a very peculiar type. You see that the sixteen-year-old daughter follows her mother's type closely. As much as thirty per cent of all associations are identical words. This is a striking case of participation, of mental contagion. If you think about this case you can draw certain conclusions. The mother was forty-five years old, married to an alcoholic. Her life was therefore a failure. Now the daughter has exactly the same reactions as the mother. If such a girl comes out into the world as though she were forty-five years old and married to an alcoholic, think what a mess she will get into! This participation explains why the daughter of an alcoholic who

has had a hell of a youth will seek a man who is an alcoholic and marry him; and if by chance he should not be one, she will make him into one on account of that peculiar identity with one member of the family.

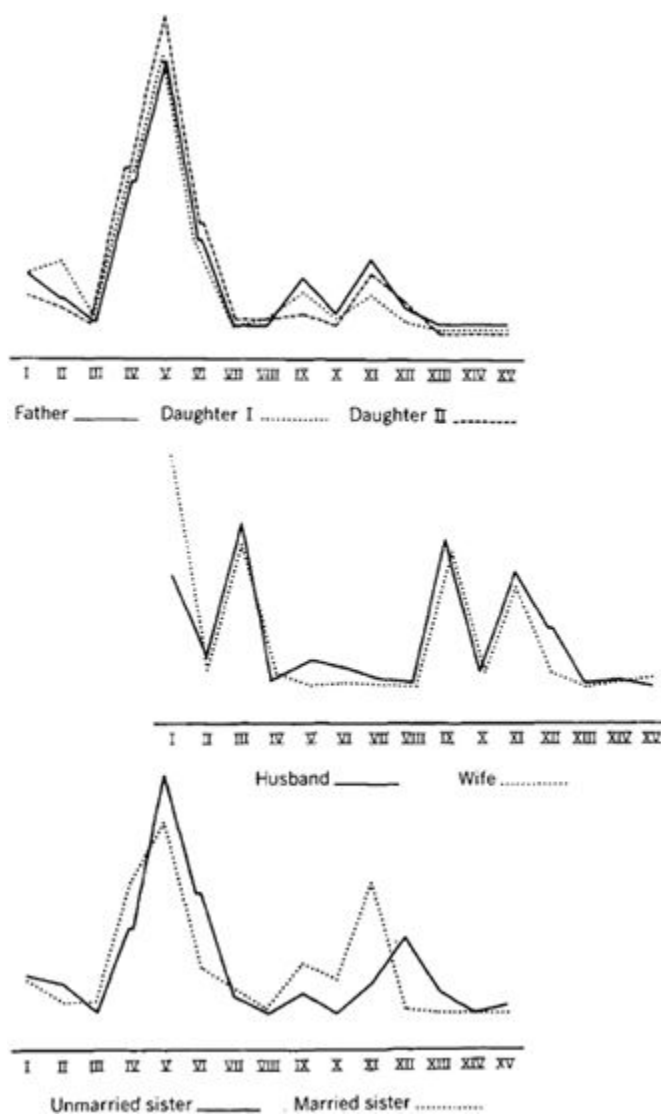

FIG. 8. Association Test of a Family

FIGS. 9–11. Association Tests of Families

[157] Figure 9 is a very striking case, too. The father, who was a widower, had two daughters who lived with him in complete identity. Of course, that also is most unnatural, because either he reacts like a girl or the two girls react like a man, even in the way they speak. The whole mental make-up is poisoned through the admixture of an alien element, because a young daughter is not in actual fact her father.

[158] Figure 10 is the case of a husband and wife. This diagram gives an optimistic tone to my very pessimistic demonstrations. You see there is perfect harmony here; but do not make the mistake of thinking that this harmony is a paradise, for these people will kick against each other after a while because they are just too harmonious. A very good harmony in a family based on participation soon leads to frantic attempts on the part of the spouses to kick loose from each other, to liberate themselves, and then they invent irritating topics of discussion in order to have a reason for feeling misunderstood. If you study the ordinary psychology of marriage, you discover that most of the troubles consist in this cunning invention of irritating topics which have absolutely no foundation.

[159] Figure 11 is also interesting. These two women are sisters living together; one is single and the other married. Their summit is found at number V. The wife in Figure 10 is the sister of these two women in Figure 11, and while most probably they were all of the same type originally, she married a man of another type. Their summit is at number III in Figure 10. The condition of identity or participation which is demonstrated in the association test can be substantiated by entirely different experiences, for instance, by graphology. The handwriting of many wives, particularly young wives, often resembles that of the husband. I do not know whether it is so in these days, but I assume that human nature remains very much the same. Occasionally it is the other way round because the so-called feeble sex has its strength sometimes.

[160] Ladies and Gentlemen, we are now going to step over the border into dreams. I do not want to give you any particular introduction to dream-analysis.⁴ I think the best way is just to show you how I proceed with a dream, and then it does not need much explanation of a theoretical kind, because you can see what are my underlying ideas. Of course, I make great use of dreams, because dreams are an objective source of information in psychotherapeutic treatment. When a doctor has a case, he can hardly refrain from having ideas about it. But the more one knows about cases, the more one should make an heroic effort not to know in order to give the patient a fair chance. I always try not to know and not to see. It is much better to say you are stupid, or play what is apparently a stupid role, in order to give the patient a chance to come out with his own material. That does not mean that you should hide altogether.

[161] This is a case of a man forty years old, a married man who has not been ill before. He looks quite all right; he is the director of a great public school, a very intelligent fellow who has studied an old-fashioned kind of psychology, Wundt psychology,⁵ that has nothing to do with details of human life but moves in the stratosphere of abstract ideas. Recently he had been badly troubled by neurotic symptoms. He suffered from a peculiar kind of vertigo that seized upon him from time to time, palpitation, nausea, and peculiar attacks of feebleness and a sort of exhaustion. This syndrome presents the picture of a sickness which is well known in Switzerland. It is mountain sickness, a malady to which people who are not used to great heights are easily subject when climbing. So I asked, "Is it not mountain sickness you are suffering from?" He said, "Yes, you are right. It feels exactly like mountain sickness." I asked him if he had dreams, and he said that recently he had had three dreams.

[162] I do not like to analyse one dream alone, because a single dream can be interpreted arbitrarily. You can speculate anything about an isolated dream; but if you compare a series of, say, twenty or a hundred dreams, then you can see interesting

things. You see the process that is going on in the unconscious from night to night, and the continuity of the unconscious psyche extending through day and night. Presumably we are dreaming all the time, although we are not aware of it by day because consciousness is much too clear. But at night, when there is that *abaissement du niveau mental*, the dreams can break through and become visible.

[163] In the first dream *the patient finds himself in a small village in Switzerland. He is a very solemn black figure in a long coat; under his arm he carries several thick books. There is a group of young boys whom he recognizes as having been his classmates. They are looking at him and they say: "That fellow does not often make his appearance here."*

[164] In order to understand this dream you have to remember that the patient is in a very fine position and has had a very good scientific education. But he started really from the bottom and is a self-made man. His parents were very poor peasants, and he worked his way up to his present position. He is very ambitious and is filled with the hope that he will rise still higher. He is like a man who has climbed in one day from sea-level to a level of 6,000 feet, and there he sees peaks 12,000 feet high towering above him. He finds himself in the place from which one climbs these higher mountains, and because of this he forgets all about the fact that he has already climbed 6,000 feet and immediately he starts to attack the higher peaks. But as a matter of fact though he does not realize it he is tired from his climbing and quite incapable of going any further at this time. This lack of realization is the reason for his symptoms of mountain sickness. The dream brings home to him the actual psychological situation. The contrast of himself as the solemn figure in the long black coat with thick books under his arm appearing in his native village, and of the village boys remarking that he does not often appear there, means that he does not often remember where he came from. On the contrary he thinks of his future career and hopes to get a chair as professor. Therefore the dream puts him back into his early surroundings. He ought to realize how much he has achieved considering who he was originally and that there are natural limitations to human effort.

[165] The beginning of the second dream is a typical instance of the kind of dream that occurs when the conscious attitude is like his. *He knows that he ought to go to an important conference, and he is taking his portfolio. But he notices that the hour is rather advanced and that the train will leave soon, and so he gets into that well-known state of haste and of fear of being too late. He tries to get his clothes together, his hat is nowhere, his coat is mislaid, and he runs about in search of them and shouts up and down the house, "Where are my things?" Finally he gets everything together, and runs out of the house only to find that he has forgotten his portfolio. He rushes back for it, and looking at his watch finds how late it is getting; then he runs to the station, but the road is quite soft so that it is like walking on a bog and his feet*

can hardly move any more. Pantingly he arrives at the station only to see that the train is just leaving. His attention is called to the railway track, and it looks like this:

FIG. 12. Dream of the Train

[166] He is at A, the tail-end of the train is already at B and the engine is at C. He watches the train, a long one, winding round the curve, and he thinks, "If only the engine-driver, when he reaches point D, has sufficient intelligence not to rush full steam ahead; for if he does, the long train behind him which will still be rounding the curve will be derailed." Now the engine-driver arrives at D and he opens the steam throttle fully, the engine begins to pull, and the train rushes ahead. The dreamer sees the catastrophe coming, the train goes off the rails, and he shouts, and then he wakes up with the fear characteristic of nightmare.

[167] Whenever one has this kind of dream of being late, of a hundred obstacles interfering, it is exactly the same as when one is in such a situation in reality, when one is nervous about something. One is nervous because there is an unconscious resistance to the conscious intention. The most irritating thing is that consciously you want something very much, and an unseen devil is always working against it, and of course you are that devil too. You are working against this devil and do it in a nervous way and with nervous haste. In the case of this dreamer, that rushing ahead is also against his will. He does not want to leave home, yet he wants it very much, and all the resistance and difficulties in his way are his own doing. He is that engine-driver who thinks, "Now we are out of our trouble; we have a straight line ahead, and

now we can rush along like anything.” The straight line beyond the curve would correspond to the peaks 12,000 feet high, and he thinks these peaks are accessible to him.

[168] Naturally, nobody seeing such a chance ahead would refrain from making the utmost use of it, so his reason says to him, “Why not go on, you have every chance in the world.” He does not see why something in him should work against it. But this dream gives him a warning that he should not be as stupid as this engine-driver who goes full steam ahead when the tail-end of the train is not yet out of the curve. That is what we always forget; we always forget that our consciousness is only a surface, our consciousness is the avant-garde of our psychological existence. Our head is only one end, but behind our consciousness is a long historical “tail” of hesitations and weaknesses and complexes and prejudices and inheritances, and we always make our reckoning without them. We always think we can make a straight line in spite of our shortcomings, but they will weigh very heavily and often we derail before we have reached our goal because we have neglected our tail-ends.

[169] I always say that our psychology has a long saurian’s tail behind it, namely the whole history of our family, of our nation, of Europe, and of the world in general. We are always human, and we should never forget that we carry the whole burden of being only human. If we were heads only we should be like little angels that have heads and wings, and of course they can do what they please because they are not hindered by a body that can walk only on the earth. I must not omit to point out, not necessarily to the patient but to myself, that this peculiar movement of the train is like a snake. Presently we shall see why.

[170] The next dream is the crucial dream, and I shall have to give certain explanations. In this dream we have to do with a peculiar animal which is half lizard and half crab. Before we go into the details of the dream, I want to make a few remarks about the method of working out the meaning of a dream. You know that there are many views and many misunderstandings as to the way in which you get at dreams.

[171] You know, for instance, what is understood by free association. This method is a very doubtful one as far as my experience goes. Free association means that you open yourself to any amount and kind of associations and they naturally lead to your complexes. But then, you see, I do not want to know the complexes of my patients. That is uninteresting to me. I want to know what the *dreams* have to say about complexes, not what the complexes are. I want to know what a man’s unconscious is doing with his complexes, I want to know what he is preparing himself for. *That* is what I read out of the dreams. If I wanted to apply the method of free association I would not need dreams. I could put up a signboard, for instance “Footpath to So-and-So,” and simply let people meditate on that and add free associations, and they would invariably arrive at their complexes. If you are riding in a Hungarian or Russian train

and look at the strange signs in the strange language, you can associate all your complexes. You have only to let yourself go and you naturally drift into your complexes.

[172] I do not apply the method of free association because my goal is not to know the complexes; I want to know what the dream is. Therefore I handle the dream as if it were a text which I do not understand properly, say a Latin or a Greek or a Sanskrit text, where certain words are unknown to me or the text is fragmentary, and I merely apply the ordinary method any philologist would apply in reading such a text. My idea is that the dream does not conceal: we simply do not understand its language. For instance, if I quote to you a Latin or a Greek passage some of you will not understand it, but that is not because the text dissimulates or conceals; it is because you do not know Greek or Latin. Likewise, when a patient seems confused, it does not necessarily mean that he is confused, but that the doctor does not understand his material. The assumption that the dream wants to conceal is a mere anthropomorphic idea. No philologist would ever think that a difficult Sanskrit or cuneiform inscription conceals. There is a very wise word of the Talmud which says that the dream is its own interpretation. The dream is the whole thing, and if you think there is something behind it, or that the dream has concealed something, there is no question but that you simply do not understand it.

[173] Therefore, first of all, when you handle a dream you say, "I do not understand a word of that dream." I always welcome that feeling of incompetence because then I know I shall put some good work into my attempt to understand the dream. What I do is this. I adopt the method of the philologist, which is far from being free association, and apply a logical principle which is called *amplification*. It is simply that of seeking the parallels. For instance, in the case of a very rare word which you have never come across before, you try to find parallel text passages, parallel applications perhaps, where that word also occurs, and then you try to put the formula you have established from the knowledge of other texts into the new text. If you make the new text a readable whole, you say, "Now we can read it." That is how we learned to read hieroglyphics and cuneiform inscriptions and that is how we can read dreams.

[174] Now, how do I find the context? Here I simply follow the principle of the association experiment. Let us assume a man dreams about a simple sort of peasant's house. Now, do I know what a simple peasant's house conveys to that man's mind? Of course not; how could I? Do I know what a simple peasant's house means to him in general? Of course not. So I simply ask, "How does that thing appear to you?"—in other words, what is your context, what is the mental tissue in which that term "simple peasant's house" is embedded? He will tell you something quite astonishing. For instance, somebody says "water." Do I know what he means by "water"? Not at

all. When I put that test word or a similar word to somebody, he will say “green.” Another one will say “H₂O,” which is something quite different. Another one will say “quicksilver,” or “suicide.” In each case I know what tissue that word or image is embedded in. That is *amplification*. It is a well-known logical procedure which we apply here and which formulates exactly the technique of finding the context.

[175] Of course. I ought to mention here the merit of Freud, who brought up the whole question of dreams and who has enabled us to approach the problem of dreams at all. You know his idea is that a dream is a distorted representation of a secret incompatible wish which does not agree with the conscious attitude and therefore is censored, that is, distorted, in order to become unrecognizable to the conscious and yet in a way to show itself and live. Freud logically says then: Let us redress that whole distortion: now be natural, give up your distorted tendencies and let your associations flow freely, then we will come to your natural facts, namely, your complexes. This is an entirely different point of view from mine. Freud is seeking the complexes, I am not. That is just the difference. I am looking for what the *unconscious is doing* with the complexes, because that interests me very much more than the fact that people have complexes. We all have complexes: it is a highly banal and uninteresting fact. Even the incest complex which you can find anywhere if you look for it is terribly banal and therefore uninteresting. It is only interesting to know what people do with their complexes; that is the practical question which matters. Freud applies the method of free association and makes use of an entirely different logical principle, a principle which in logic is called *reductio in primam figuram*, reduction to the first figure. The *reductio in primam figuram* is a so-called syllogism, a complicated sequence of logical conclusions, whose characteristic is that you start from a perfectly reasonable statement, and, through surreptitious assumptions and insinuations, you gradually change the reasonable nature of your first simple or prime figure until you reach a complete distortion which is utterly unreasonable. That complete distortion, in Freud’s idea, characterizes the dream; the dream is a clever distortion that disguises the original figure, and you have only to undo the web in order to return to the first reasonable statement, which may be “I wish to commit this or that: I have such and such an incompatible wish.” We start, for instance, with a perfectly reasonable assumption, such as “No unreasonable being is free”—in other words, has free will. This is an example which is used in logic. It is a fairly reasonable statement. Now we come to the first fallacy, “Therefore, no free being is unreasonable.” You cannot quite agree because there is already a trick. Then you continue, “All human beings are free”—they all have free will. Now you triumphantly finish up, “Therefore no human being is unreasonable.” That is complete nonsense.

[176] Let us assume that the dream is such an utterly nonsensical statement. This is perfectly plausible because obviously the dream is something like a nonsensical statement; otherwise you could understand it. As a rule you cannot understand it; you hardly ever come across dreams which are clear from beginning to end. The ordinary dream seems absolute nonsense and therefore one depreciates it. Even primitives, who make a great fuss about dreams, say that ordinary dreams mean nothing. But there are “big” dreams; medicine men and chiefs have big dreams, but ordinary men have no dreams. They talk exactly like people in Europe. Now you are confronted with that dream-nonsense, and you say, “This nonsense must be an insinuating distortion or fallacy which derives from an originally reasonable statement.” You undo the whole thing and you apply the *reductio in primam figuram* and then you come to the initial undisturbed statement. So you see that the procedure of Freud’s dream-interpretation is perfectly logical, if you assume that the statement of the dream is really nonsensical.

[177] But do not forget when you make the statement that a thing is unreasonable that perhaps you do not understand because you are not God; on the contrary, you are a fallible human being with a very limited mind. When an insane patient tells me something, I may think: “What that fellow is talking about is all nonsense.” As a matter of fact, if I am scientific, I say “I do not understand,” but if I am unscientific, I say “That fellow is just crazy and I am intelligent.” This argumentation is the reason why men with somewhat unbalanced minds often like to become alienists. It is humanly understandable because it gives you a tremendous satisfaction, when you are not quite sure of yourself, to be able to say “Oh, the others are much worse.”

[178] But the question remains: Can we safely say that a dream is nonsense? Are we quite sure that we know? Are we sure that the dream is a distortion? Are you absolutely certain when you discover something quite against your expectation that it is a mere distortion? Nature commits no errors. Right and wrong are human categories. The natural process is just what it is and nothing else—it is not nonsense and it is not unreasonable. We do not understand: that is the fact. Since I am not God and since I am a man of very limited intellectual capacities, I had better assume that I do not understand dreams. With that assumption I reject the prejudiced view that the dream is a distortion, and I say that if I do not understand a dream, it is my mind which is distorted, I am not taking the right view of it.

[179] So I adopted the method which philologists apply to difficult texts, and I handle dreams in the same way. It is, of course, a bit more circumstantial and more difficult; but I can assure you that the results are far more interesting when you arrive at things that are human than when you apply a most dreadful monotonous interpretation. I hate to be bored. Above all we should avoid speculations and theories when we have to deal with such mysterious processes as dreams. We should never forget that for

thousands of years very intelligent men of great knowledge and vast experience held very different views about them. It is only quite recently that we invented the theory that a dream is nothing. All other civilizations have had very different ideas about dreams.

[180] Now I will tell you the big dream of my patient: *“I am in the country, in a simple peasant’s house, with an elderly, motherly peasant woman. I talk to her about a great journey I am planning: I am going to walk from Switzerland to Leipzig. She is enormously impressed, at which I am very pleased. At this moment I look through the window at a meadow where there are peasants gathering hay. Then the scene changes. In the background appears a monstrously big crab-lizard. It moves first to the left and then to the right so that I find myself standing in the angle between them as if in an open pair of scissors. Then I have a little rod or a wand in my hand, and I lightly touch the monster’s head with the rod and kill it. Then for a long time I stand there contemplating that monster.”*

[181] Before I go into such a dream I always try to establish a sequence, because this dream has a history before and will have a history afterwards. It is part of the psychic tissue that is continuous, for we have no reason to assume that there is no continuity in the psychological processes, just as we have no reason to think that there is any gap in the processes of nature. Nature is a continuum, and so our psyche is very probably a continuum. This dream is just one flash or one observation of psychic continuity that became visible for a moment. As a continuity it is connected with the preceding dreams. In the previous dream we have already seen that peculiar snake-like movement of the train. This comparison is merely a hypothesis, but I have to establish such connections.

[182] After the train-dream the dreamer is back in the surroundings of his early childhood; he is with a motherly peasant woman—a slight allusion to the mother, as you notice. In the very first dream, he impresses the village boys by his magnificent appearance in the long coat of the Herr Professor. In this present dream too he impresses the harmless woman with his greatness and the greatness of his ambitious plan to walk to Leipzig—an allusion to his hope of getting a chair there. The monster crab-lizard is outside our empirical experience; it is obviously a creation of the unconscious. So much we can see without any particular effort.

[183] Now we come to the actual context. I ask him, “What are your associations to ‘simple peasant’s house’?” and to my enormous astonishment he says, “It is the lazarus-house of St. Jacob near Basel.” This house was a very old leprosy, and the building still exists. The place is also famous for a big battle fought there in 1444 by the Swiss against the troops of the Duke of Burgundy. His army tried to break into Switzerland but was beaten back by the avant-garde of the Swiss army, a body of 1,300 men who fought the Burgundian army consisting of 30,000 men at the lazarus-house of St. Jacob.

The 1,300 Swiss fell to the very last man, but by their sacrifice they stopped the further advance of the enemy. The heroic death of these 1,300 men is a notable incident in Swiss history, and no Swiss is able to talk of it without patriotic feeling.

[184] Whenever the dreamer brings such a piece of information, you have to put it into the context of the dream. In this case it means that the dreamer is in a leprosy. The leprosy-house is called "Siechenhaus," sick-house, in German, the "sick" meaning the lepers. So he has, as it were, a revolting contagious disease; he is an outcast from human society, he is in the sick-house. And that sick-house is characterized, moreover, by that desperate fight which was a catastrophe for the 1,300 men and which was brought about by the fact that they did not obey orders. The avant-garde had strict instructions not to attack but to wait until the whole of the Swiss army had joined up with them. But as soon as they saw the enemy they could not hold back and, against the commands of their leaders, made a headlong rush and attacked, and of course they were all killed. Here again we come to the idea of this rushing ahead without establishing a connection with the bulk of the tail-end, and again the action is fatal. This gave me a rather uncanny feeling, and I thought, "Now what is the fellow after, what danger is he coming to?" The danger is not just his ambition, or that he wishes to be with the mother and commit incest, or something of the kind. You remember, the engine-driver is a foolish fellow too; he runs ahead in spite of the fact that the tail-end of the train is not yet out of the curve; he does not wait for it, but rushes along without thinking of the whole. That means that the dreamer has the tendency to rush ahead, not thinking of his tail; he behaves as if he were his head only, just as the avant-garde behaved as if it were the whole army, forgetting that it had to wait; and because it did not wait, every man was killed. This attitude of the patient is the reason for his symptoms of mountain sickness. He went too high, he is not prepared for the altitude, he forgets where he started from.

[185] You know perhaps the novel by Paul Bourget, *L'Étape*. Its motif is the problem that a man's low origin always clings to him, and therefore there are very definite limitations to his climbing the social ladder. That is what the dream tries to remind the patient of. That house and that elderly peasant woman bring him back to his childhood. It looks, then, as if the woman might refer to the mother. But one must be careful with assumptions. His answer to my question about the woman was "That is my landlady." His landlady is an elderly widow, uneducated and old-fashioned, living naturally in a milieu inferior to his. He is too high up, and he forgets that the next part of his invisible self is the family in himself. Because he is a very intellectual man, feeling is his inferior function. His feeling is not at all differentiated, and therefore it is still in the form of the landlady, and in trying to impose upon that landlady he tries to impose upon himself with his enormous plan to walk to Leipzig.

[186] Now what does he say about the trip to Leipzig? He says, "Oh, that is my ambition. I want to go far, I wish to get a Chair." Here is the headlong rush, here is the foolish attempt, here is the mountain sickness; he wants to climb too high. This dream was before the war, and at that time to be a professor in Leipzig was something marvellous. His feeling was deeply repressed; therefore it does not have right values and is much too naïve. It is still the peasant woman; it is still identical with his own mother. There are many capable and intelligent men who have no differentiation of feeling, and therefore their feeling is still contaminated with the mother, is still in the mother, identical with the mother, and they have mothers' feelings; they have wonderful feelings for babies, for the interiors of houses and nice rooms and for a very orderly home. It sometimes happens that these individuals, when they have turned forty, discover a masculine feeling and then there is trouble.

[187] The feelings of a man are so to speak a woman's and appear as such in dreams. I designate this figure by the term *anima*, because she is the personification of the inferior functions which relate a man to the collective unconscious. The collective unconscious as a whole presents itself to a man in feminine form. To a woman it appears in masculine form, and then I call it the *animus*. I chose the term *anima* because it has always been used for that very same psychological fact. The *anima* as a personification of the collective unconscious occurs in dreams over and over again.⁶ I have made long statistics about the *anima* figure in dreams. In this way one establishes these figures empirically.

[188] When I ask my dreamer what he means when he says that the peasant woman is impressed by his plan, he answers, "Oh, well, that refers to my boasting. I like to boast before an inferior person to show who I am; when I am talking to uneducated people I like to put myself very much in the foreground. Unfortunately I have always to live in an inferior milieu." When a man resents the inferiority of his milieu and feels that he is too good for his surroundings, it is because the inferiority of the milieu *in himself* is projected into the outer milieu and therefore he begins to mind those things which he should mind in himself. When he says, "I mind my inferior milieu," he ought to say, "I mind the fact that my own inner milieu is below the mark." He has no right values, he is inferior in his feeling-life. That is his problem.

[189] At this moment he looks out of the window and sees the peasants gathering hay. That, of course, again is a vision of something he has done in the past. It brings back to him memories of similar pictures and situations; it was in summer and it was pretty hard work to get up early in the morning to turn the hay during the day and gather it in the evening. Of course, it is the simple honest work of such folk. He forgets that only the decent simple work gets him somewhere and not a big mouth. He also asserts, which I must mention, that in his present home he has a picture on the wall of peasants gathering hay, and he says, "Oh, that is the origin of the picture

in my dream.” It is as though he said, “The dream is nothing but a picture on the wall, it has no importance, I will pay no attention to it.” At that moment the scene changes. When the scene changes you can always safely conclude that a representation of an unconscious thought has come to a climax, and it becomes impossible to continue that motif.

[190] Now in the next part of the dream things are getting dark; the crab-lizard appears, apparently an enormous thing. I asked, “What about the crab, how on earth do you come to that?” He said, “That is a mythological monster which walks backwards. The crab walks backwards. I do not understand how I get to this thing—probably through some fairytale or something of that sort.” What he had mentioned before were all things which you could meet with in real life, things which do actually exist. But the crab is not a personal experience, it is an archetype. When an analyst has to deal with an archetype he may begin to think. In dealing with the *personal* unconscious you are not allowed to think too much and to add anything to the associations of the patient. Can you add something to the personality of somebody else? You are a personality yourself. The other individual has a life of his own and a mind of his own inasmuch as he is a person. But inasmuch as he is not a person, inasmuch as he is also myself, he has the same basic structure of mind, and there I can begin to think, I can associate for him. I can even provide him with the necessary context because he will have none, he does not know where that crab-lizard comes from and has no idea what it means, but I know and can provide the material for him.

[191] I point out to him that the hero motif appears throughout the dreams. He has a hero fantasy about himself which comes to the surface in the last dream. He is the hero as the great man with the long coat and with the great plan; he is the hero who dies on the field of honour at St. Jacob; he is going to show the world who he is; and he is quite obviously the hero who overcomes the monster. The hero motif is invariably accompanied by the dragon motif; the dragon and the hero who fights him are two figures of the same myth.

[192] The dragon appears in his dream as the crab-lizard. This statement does not, of course, explain what the dragon represents as an image of his psychological situation. So the next associations are directed round the monster. When it moves first to the left and then to the right the dreamer has the feeling that he is standing in an angle which could shut on him like open scissors. That would be fatal. He has read Freud, and accordingly he interprets the situation as an incest wish, the monster being the mother, the angle of the open scissors the legs of the mother, and he himself, standing in between, being just born or just going back into the mother.

[193] Strangely enough, in mythology, the dragon *is* the mother. You meet that motif all over the world, and the monster is called the mother dragon.⁷ The mother dragon eats the child again, she sucks him in after having given birth to him. The “terrible

mother,” as she is also called, is waiting with wide-open mouth on the Western Seas, and when a man approaches that mouth it closes on him and he is finished. That monstrous figure is the mother sarcophaga, the flesh-eater; it is, in another form, Matuta, the mother of the dead. It is the goddess of death.

[194] But these parallels still do not explain why the dream chooses the particular image of the crab. I hold—and when I say I hold I have certain reasons for saying so—that representations of psychic facts in images like the snake or the lizard or the crab or the mastodon or analogous animals also represent organic facts. For instance, the serpent very often represents the cerebro-spinal system, especially the lower centres of the brain, and particularly the medulla oblongata and spinal cord. The crab, on the other hand, having a sympathetic system only, represents chiefly the sympathicus and para-sympathicus of the abdomen; it is an abdominal thing. So if you translate the text of the dream it would read: if you go on like this your cerebro-spinal system and your sympathetic system will come up against you and snap you up. That is in fact what is happening. The symptoms of his neurosis express the rebellion of the sympathetic functions and of the cerebro-spinal system against his conscious attitude.

[195] The crab-lizard brings up the archetypal idea of the hero and the dragon as deadly enemies. But in certain myths you find the interesting fact that the hero is not connected with the dragon only by his fight. There are, on the contrary, indications that the hero is himself the dragon. In Scandinavian mythology the hero is recognized by the fact that he has snake’s eyes. He has snake’s eyes because he is a snake. There are many other myths and legends which contain the same idea. Cecrops, the founder of Athens, was a man above and a serpent below. The souls of heroes often appear after death in the form of serpents.

[196] Now in our dream the monstrous crab-lizard moves first to the left, and I ask him about this left side. He says, “The crab apparently does not know the way. Left is the unfavourable side, left is sinister.” Sinister does indeed mean left and unfavourable. But the right side is also not good for the monster, because when it goes to the right it is touched by the wand and is killed. Now we come to his standing in between the angle of the monster’s movement, a situation which at first glance he interpreted as incest. He says, “As a matter of fact, I felt surrounded on either side like a hero who is going to fight a dragon.” So he himself realizes the hero motif.

[197] But unlike the mythical hero he does not fight the dragon with a weapon, but with a wand. He says, “From its effect on the monster it seems that it is a magical wand.” He certainly does dispose of the crab in a magical way. The wand is another mythological symbol. It often contains a sexual allusion, and sexual magic is a means of protection against danger. You may remember, too, how during the earthquake at

Messina⁸ nature produced certain instinctive reactions against the overwhelming destruction.

[198] The wand is an instrument, and instruments in dreams mean what they actually are, the devices of man to concretize his will. For instance, a knife is my will to cut; when I use a spear I prolong my arm, with a rifle I can project my action and my influence to a great distance; with a telescope I do the same as regards my sight. An instrument is a mechanism which represents my will, my intelligence, my capability, and my cunning. Instruments in dreams symbolize an analogous psychological mechanism. Now this dreamer's instrument is a magic wand. He uses a marvellous thing by which he can spirit away the monster, that is, his lower nervous system. He can dispose of such nonsense in no time, and with no effort at all.

[199] What does this actually mean? It means that he simply thinks that the danger does not exist. That is what is usually done. You simply think that a thing is not and then it is no more. That is how people behave who consist of the head only. They use their intellect in order to think things away; they reason them away. They say, "This is nonsense, therefore it cannot be and therefore it is not." That is what he also does. He simply reasons the monster away. He says, "There is no such thing as a crab-lizard, there is no such thing as an opposing will; I get rid of it, I simply think it away. I think it is the mother with whom I want to commit incest, and that settles the whole thing, for I shall not do it." I said, "You have killed the animal—what do you think is the reason why you contemplate the animal for such a long time?" He said, "Oh, well, yes, naturally it is marvellous how you can dispose of such a creature with such ease." I said, "Yes, indeed it is very marvellous!"

[200] Then I told him what I thought of the situation. I said, "Look here, the best way to deal with a dream is to think of yourself as a sort of ignorant child or ignorant youth, and to come to a two-million-year-old man or to the old mother of days and ask, 'Now, what do you think of me?' She would say to you, 'You have an ambitious plan, and that is foolish, because you run up against your own instincts. Your own restricted capabilities block the way. You want to abolish the obstacle by the magic of your thinking. You believe you can think it away by the artifices of your intellect, but it will be, believe me, matter for some afterthought.' "And I also told him this: "Your dreams contain a warning. You behave exactly like the engine-driver or like the Swiss who were foolhardy enough to run up against the enemy without any support behind them, and if you behave in the same way you will meet with a catastrophe."

[201] He was sure that such a point of view was much too serious. He was convinced that it is much more probable that dreams come from incompatible wishes and that he really had an unrealized incestuous wish which was at the bottom of this dream; that he was conscious now of this incestuous wish and had got rid of it and now could go to Leipzig. I said, "Well then, bon voyage." He did not return, he went on with his

plans, and it took him just about three months to lose his position and go to the dogs. That was the end of him. He ran up against the fatal danger of that crab-lizard and would not understand the warning. But I do not want to make you too pessimistic. Sometimes there are people who really understand their dreams and draw conclusions which lead to a more favourable solution of their problems.

Discussion

Dr. Charles Brunton:

[202] I do not know whether it is fair to ask about the dreams of someone who is not here, but I have a small daughter five and a half years old who has recently had two dreams which awakened her at night. The first dream occurred in the middle of August, and she told me this: "I see a wheel, and it is rolling down a road and it burns me." That was all I could get out of her. I wanted her to draw a picture of it the next day, but she did not want to be bothered, so I left it. The other dream was about a week ago, and this time it was "a beetle that was pinching me." That was all I could get about it. I do not know whether you would like to comment on them. The only thing I would like to add is that she knows the difference between a beetle and a crab. She is very fond of animals.

Professor Jung:

[203] You have to consider that it is very difficult and not quite fair to comment on dreams of someone one does not know; but I will tell you as much as one can see from the symbolism. The beetle would, according to my idea, have to do with the sympathetic system. Therefore I should conclude from that dream that there are certain peculiar psychological processes going on in the child, which touch upon her sympathetic system, and this might arouse some intestinal or other abdominal disorder. The most cautious statement one could make would be to say that there is a certain accumulation of energy in the sympathetic system which causes slight disturbances. This is also borne out by the symbol of the fiery wheel. The wheel in her dream seems to be a sun-symbol, and in Tantric philosophy fire corresponds to the so-called *manipura chakra*, which is localized in the abdomen. In the prodromal symptoms of epilepsy you sometimes find the idea of a wheel revolving inside. This too expresses a manifestation of a sympathetic nature. The image of the revolving wheel reminds us of the wheel upon which Ixion was crucified. The dream of the little girl is an archetypal dream, one of those strange archetypal dreams children occasionally have.

[204] I explain these archetypal dreams of children by the fact that when consciousness begins to dawn, when the child begins to feel that *he is*, he is still close to the original psychological world from which he has just emerged: a condition of deep unconsciousness. Therefore you find with many children an awareness of the contents of the collective unconscious, a fact which in some Eastern beliefs is interpreted as reminiscence of a former existence. Tibetan philosophy, for instance,

speaks of the “Bardo” existence and of the condition of the mind between death and birth.⁹ The idea of former existence is a projection of the psychological condition of early childhood. Very young children still have an awareness of mythological contents, and if these contents remain conscious too long, the individual is threatened by an incapacity for adaptation; he is haunted by a constant yearning to remain with or to return to the original vision. There are very beautiful descriptions of these experiences by mystics and poets.

[205] Usually at the age of four to six the veil of forgetfulness is drawn upon these experiences. However, I have seen cases of ethereal children, so to speak, who had an extraordinary awareness of these psychic facts and were living their life in archetypal dreams and could not adapt. Recently I saw a case of a little girl of ten who had some most amazing mythological dreams.¹⁰ Her father consulted me about these dreams. I could not tell him what I thought because they contained an uncanny prognosis. The little girl died a year later of an infectious disease. She had never been born entirely.

Dr. Leonard F. Browne:

[206] I should like to ask Professor Jung a question with regard to the interpretation of the dreams he told us today. In view of the fact that the patient was unable to accept the interpretation, I should like to know whether that difficulty could have been overcome by some variation in the technique.

Professor Jung:

[207] If I had had the intention of being a missionary, or a saviour, I should have used a clever trick. I should have said to the patient, “Yes, that is the mother complex all right,” and we would have gone on talking that kind of jargon for several months and perhaps in the end I would have swung him round. But I know from experience that such a thing is not good; you should not cheat people even for their good. I do not want to cheat people out of their mistaken faith. Perhaps it was better for that man to go to the dogs than to be saved by wrong means. I never hinder people. When somebody says, “I am going to commit suicide if—,” I say, “If that is your intention, I have no objection.”

Dr. Browne:

[208] Did you have any evidence that the symptoms of mountain sickness were cured?

Professor Jung:

[209] The patient lost his neurosis in going down in life. That man did not belong at a height of 6,000 feet; he belonged lower down. He became inferior instead of being neurotic. Once I talked to the head of a great institution in America for the education of criminal children, and was told about a very interesting experience. They have two categories of children. The majority of them, when they come to the institution, feel ever so much better, they develop very nicely and normally and they eventually grow out of whatever their original evil was. The other category, the minority, become hysterical when they try to be nice and normal. Those are the born criminals whom you cannot change. They are normal when they do wrong. We also do not feel quite right when we are behaving perfectly, we feel much better when we are doing a bit of wrong. That is because we are not perfect. The Hindus, when they build a temple, leave one corner unfinished; only the gods make something perfect, man never can. It is much better to know that one is not perfect, then one feels much better. So it is with these children, and so it is with our patients. It is wrong to cheat people out of their fate and to help them to go beyond their level. If a man has it in him to be adapted, help him by all means; but if it is really his task *not* to be adapted, help him by all means not to be adapted, because then he is all right.

[210] What would the world be like if all people were adapted? It would be boring beyond endurance. There must be some people who behave in the wrong way; they act as scapegoats and objects of interest for the normal ones. Think how grateful you are for detective novels and newspapers, so that you can say, "Thank heaven I am not that fellow who has committed the crime, I am a perfectly innocent creature." You feel satisfaction because the evil people have done it for you. This is the deeper meaning of the fact that Christ as the redeemer was crucified between two thieves. These thieves in their way were also redeemers of mankind, they were the scapegoats.

Question:

[211] I would like to ask a question about the psychological functions, if that is not going too far back. In answering a question last night you said that there was no criterion for considering either of the four functions as being superior in itself and you further said that all the four functions would have to be equally differentiated in order to obtain full and adequate knowledge of the world. Do you mean, therefore, that it is possible in any given case for all the four functions to be equally differentiated or to be arrived at by education?

Professor Jung:

[212] I do not believe that it is humanly possible to differentiate all four functions alike, otherwise we would be perfect like God, and that surely will not happen. There will always be a flaw in the crystal. We can never reach perfection. Moreover, if we could differentiate the four functions equally we should only make them into consciously disposable functions. Then we would lose the most precious connection with the unconscious through the inferior function, which is invariably the weakest; only through our feebleness and incapacity are we linked up with the unconscious, with the lower world of the instincts and with our fellow beings. Our virtues only enable us to be independent. There we do not need anybody, there we are kings; but in our inferiority we are linked up with mankind as well as with the world of our instincts. It would not even be an advantage to have all the functions perfect, because such a condition would amount to complete aloofness. I have no perfection craze. My principle is: for heaven's sake do not be perfect, but by all means try to be complete—whatever that means.

Question:

[213] May I ask what it means to be complete? Will you enlarge upon that?

Professor Jung:

[214] I must leave something to your own mental efforts. It is surely a most amusing enterprise, for instance, to think on your way home what it possibly means to be complete. We should not deprive people of the pleasure of discovering something. To be complete is a very great problem, and to talk of it is amusing, but to be it is the main thing.

Question:

[215] How do you fit mysticism into your scheme?

Professor Jung:

[216] Into what scheme?

Reply:

[217] The scheme of psychology and the psyche.

Professor Jung:

[218] Of course you should define what you mean by mysticism. Let us assume that you mean people who have mystical experience. Mystics are people who have a particularly vivid experience of the processes of the collective unconscious. Mystical experience is experience of archetypes.

Question:

[219] Is there any difference between archetypal forms and mystical forms?

Professor Jung:

[220] I make no distinction between them. If you study the phenomenology of mystical experience you will come across some very interesting things. For instance, you all know that our Christian heaven is a masculine heaven and that the feminine element is only tolerated. The Mother of God is not divine, she is only the arch-saint. She intercedes for us at the throne of God but she is not part of the Deity. She does not belong to the Trinity.

[221] Now some Christian mystics have a different experience. For instance we have a Swiss mystic, Niklaus von der Flüe.¹¹ He experienced a God and a Goddess. Then there was a mystic of the thirteenth century, Guillaume de Digulleville, who wrote the *Pèlerinage de l'âme de Jésus Christ*.¹² Like Dante, he had a vision of the highest paradise as "le ciel d'or," and there upon a throne one thousand times more bright than the sun sat le Roi, who is God himself, and beside him on a crystal throne of brownish hue, la Reine, presumably the Earth. This is a vision outside the Trinity idea, a mystical experience of an archetypal nature which includes the feminine principle. The Trinity is a dogmatic image based on an archetype of an exclusively masculine nature. In the Early Church the Gnostic interpretation of the Holy Ghost as feminine was declared a heresy.

[222] Dogmatic images, such as the Trinity, are archetypes which have become abstract ideas. But there are a number of mystical experiences inside the Church whose archetypal character is still visible. Therefore they sometimes contain a heretical or pagan element. Remember, for instance, St. Francis of Assisi. Only through the great diplomatic ability of Pope Boniface VIII could St. Francis be assimilated into the Church. You have only to think of his relation to animals to understand the difficulty. Animals, like the whole of Nature, were taboo to the Church. Yet there are sacred animals like the Lamb, the Dove, and, in the Early Church, the Fish, which are worshipped.

Question:

[223] Will Professor Jung give us his view on the psychological differences between the dissociation in hysteria and the dissociation in schizophrenia?

Professor Jung:

[224] In hysteria the dissociated personalities are still in a sort of interrelation, so that you always get the impression of a total person. With a hysterical case you can establish a rapport, you get a feeling reaction from the whole person. There is only a superficial division between certain memory compartments, but the basic personality is always present. In the case of schizophrenia that is not so. There you encounter only fragments, there is nowhere a whole. Therefore, if you have a friend or a relative whom you have known well and who becomes insane, you will get a tremendous shock when you are confronted with a fragmentary personality which is completely split up. You can only deal with one fragment at a time; it is like a splinter of glass. You do not feel the continuity of the personality any longer. While with a hysterical case you think: if I could only wipe away that sort of obscuration or that sort of somnambulism then we should have the sum-total of the personality. But with schizophrenia it is a deep dissociation of personality; the fragments cannot come together any more.

Question:

[225] Are there any more strictly psychological conceptions by which that difference can be expressed?

Professor Jung:

[226] There are certain borderline cases where you can stitch the parts together if you can reintegrate the lost contents. I will tell you of a case I had. A woman had been twice in a lunatic asylum with a typical schizophrenic attack. When she was brought to me she was better, but still in a state of hallucination. I saw that it was possible to reach the split-off parts. Then I began to go through every detail of the experiences which she had had in the lunatic asylum with her; we went through all the voices and all the delusions, and I explained every fact to her so that she could associate them with her consciousness. I showed her what these unconscious contents were that came up during her insanity, and because she was an intelligent person, I gave her books to read so that she acquired a great deal of knowledge, chiefly mythological knowledge, by which she herself could stitch the parts together. The breaking lines were still there, of course, and whenever afterwards she had a new wave of disintegration I told her to try to draw or paint a picture of that particular situation in order to have a picture of the whole of herself which objectified her condition, and so

she did. She brought me quite a number of pictures she had made, which had helped her whenever she felt she was falling apart again. In this way I have kept her afloat for about twelve years, and she has had no more attacks which necessitated her seclusion in an asylum. She could always manage to ward off the attacks by objectifying their contents. She told me, moreover, that when she had made such a picture she went to her books and read a chapter about some of its main features, in order to bring it into general connection with mankind, with what people know, with the collective consciousness, and then she felt right again. She said she felt adapted and she was no longer at the mercy of the collective unconscious.

[227] All cases are not as accessible as that one, as you will realize. I cannot cure schizophrenia in principle. Occasionally by great good chance I can synthesize the fragments. But I do not like to do it because it is frightfully difficult work.

LECTURE IV

The Chairman (Dr. Emanuel Miller):

[228] I shall not take any of Professor Jung's time away from you but will merely express my great pleasure at the opportunity of being Chairman this evening. Only I am put to a grave disadvantage: I have not been able to attend the previous lectures and therefore I do not know to what depths of the unconscious Professor Jung has already led you, but I think he is going to continue tonight the presentation of his method of dream-analysis.

Professor Jung:

[229] The interpretation of a profound dream, such as our last one was, is never sufficient when it is left in the personal sphere. This dream contains an archetypal image, and that is always an indication that the psychological situation of the dreamer extends beyond the mere personal layer of the unconscious. His problem is no more entirely a personal affair, but something which touches upon the problems of mankind in general. The symbol of the monster is an indication of this. This symbol brings up the hero myth, and furthermore the association with the battle of St. Jacob, which characterizes the localization of the scene, appeals also to a general interest.

[230] The ability to apply a general point of view is of great therapeutic importance. Modern therapy is not much aware of this, but in ancient medicine it was well known that the raising of the personal disease to a higher and more impersonal level had a curative effect. In ancient Egypt, for instance, when a man was bitten by a snake, the priest-physician was called in, and he took from the temple library the manuscript about the myth of Rā and his mother Isis, and recited it. Isis had made a poisonous worm and hidden it in the sand, and the god Rā had stepped on the serpent and was bitten by it, so that he suffered terrible pain and was threatened with death. Therefore the gods caused Isis to work a spell which drew the poison out of him.¹ The idea was that the patient would be so impressed by this narrative that he would be cured. To us this sounds quite impossible. We could not imagine that the reading of a story from *Grimm's Fairy Tales*, for instance, would cure typhoid fever or pneumonia. But we only take into account our rational modern psychology. To understand the effect we have to consider the psychology of the ancient Egyptians, which was quite different. And yet those people were not so very different. Even with us certain things can work miracles; sometimes spiritual consolation or psychological influence alone can

cure, or at least will help to cure an illness. And of course it is all the more so with a person on a more primitive level and with a more archaic psychology.

[231] In the East a great amount of practical therapy is built upon this principle of raising the mere personal ailment into a generally valid situation, and ancient Greek medicine also worked with the same method. Of course the collective image or its application has to be in accordance with the particular psychological condition of the patient. The myth or legend arises from the archetypal material which is constellated by the disease, and the psychological effect consists in connecting the patient with the general human meaning of his particular situation. Snakebite, for instance, is an archetypal situation, therefore you find it as a motif in any number of tales. If the archetypal situation underlying the illness can be expressed in the right way the patient is cured. If no adequate expression is found, the individual is thrown back upon himself, into the isolation of being ill; he is alone and has no connection with the world. But if he is shown that his particular ailment is not his ailment only, but a general ailment—even a god's ailment—he is in the company of men and gods, and this knowledge produces a healing effect. Modern spiritual therapy uses the same principle: pain or illness is compared with the sufferings of Christ, and this idea gives consolation. The individual is lifted out of his miserable loneliness and represented as undergoing a heroic meaningful fate which is ultimately good for the whole world, like the suffering and death of a god. When an ancient Egyptian was shown that he was undergoing the fate of Ra, the sun-god, he was immediately ranked with the Pharaoh, who was the son and representative of the gods, and so the ordinary man was a god himself, and this brought such a release of energy that we can understand quite well how he was lifted out of his pain. In a particular frame of mind people can endure a great deal. Primitives can walk on glowing coals and inflict the most terrible injuries on themselves under certain circumstances without feeling any pain. And so it is quite likely that an impressive and adequate symbol can mobilize the forces of the unconscious to such an extent that even the nervous system becomes affected and the body begins to react in a normal way again.

[232] In the case of psychological suffering, which always isolates the individual from the herd of so-called normal people, it is also of the greatest importance to understand that the conflict is not a personal failure only, but at the same time a suffering common to all and a problem with which the whole epoch is burdened. This general point of view lifts the individual out of himself and connects him with humanity. The suffering does not even have to be a neurosis; we have the same feeling in very ordinary circumstances. If for instance you live in a well-to-do community, and you suddenly lose all your money, your natural reaction will be to think that it is terrible and shameful and that you are the only one who is such an ass as to lose his money. But if everybody loses his money it is quite another matter and

you feel reconciled to it. When other people are in the same hole as I am I feel much better. If a man is lost in the desert or quite alone on a glacier, or if he is the responsible leader of a group of men in a precarious situation, he will feel terrible. But when he is a soldier in a whole battalion that is lost, he will join the rest in cheering and making jokes, and will not realize the danger. The danger is not less, but the individual feels quite differently about it in a group than when he has to face it alone.

[233] Whenever archetypal figures appear in dreams, especially in the later stages of analysis, I explain to the patient that his case is not particular and personal, but that his psychology is approaching a level which is universally human. That outlook is very important, because a neurotic feels tremendously isolated and ashamed of his neurosis. But if he knows his problem to be general and not merely personal, it makes all the difference. In the case of our dreamer, if I had been going on with the treatment I would have called the patient's attention to the fact that the motif in his last dream was a general human situation. He himself in his associations had realized the hero-dragon conflict.

[234] The hero's fight with the dragon, as the symbol of a typical human situation, is a very frequent mythological motif. One of the most ancient literary expressions of it is the Babylonian Creation Myth, where the hero-god Marduk fights the dragon Tiamat. Marduk is the spring-god and Tiamat is the mother-dragon, the primordial chaos. Marduk kills her and splits her in two parts. From one half he makes the heavens and from the other he makes the earth.²

[235] A more striking parallel to our case is the great Babylonian epos of Gilgamesh.³ Gilgamesh is really an *arriviste par excellence*, a man of ambitious plans, like our dreamer, and a great king and hero. All the men are working for him like slaves to build a town with mighty walls. The women feel neglected and complain to the gods about their reckless tyrant. So the gods decide that something has to be done about it. Translated into psychological language this means: Gilgamesh is using his consciousness only, his head has wings and is detached from the body, and his body is going to say something about it. It will react with a neurosis, that is, by constellating a very opposite factor. How is this neurosis described in the poem? The gods decide to "call up," that is to make, a man like Gilgamesh. They create Enkidu; yet he is in some ways different. The hair of his head is long, he looks like a cave-man, and he lives with the wild animals in the plains and drinks from the water-wells of the gazelles. Gilgamesh, being normal so far, has a perfectly normal dream about the intention of the gods. He dreams that a star falls down on his back, a star like a mighty warrior, and Gilgamesh is wrestling with him but cannot shake himself free. Finally he overcomes him and puts him down at his mother's feet, and the mother "makes him equal" to Gilgamesh. The mother is a wise woman and interprets the

dream for Gilgamesh so that he is ready to meet the danger. Enkidu is meant to fight Gilgamesh and bring him down, but Gilgamesh in a very clever way makes him his friend. He has conquered the reaction of his unconscious by cunning and will-power and he persuades his opponent that they are really friends and that they can work together. Now things are going worse than ever.

[236] Although right in the beginning Enkidu has an oppressive dream, a vision of the underworld where the dead live, Gilgamesh is preparing for a great adventure. Like heroes, Gilgamesh and Enkidu start out together to overcome Humbaba, a terrible monster whom the gods have made guardian of their sanctuary on the cedar mountain. His voice roars like the tempest, and everybody who approaches the wood is overcome by weakness. Enkidu is brave and very strong, but he is nervous about the enterprise. He is depressed by bad dreams and pays a lot of attention to them, like the inferior man in ourselves whom we ridicule when that inferior part of ourselves feels superstitious about certain dates, and so on; the inferior man nevertheless continues to be nervous about certain things. Enkidu is very superstitious, he has had bad dreams on the way to the forest and has forebodings that things will go wrong. But Gilgamesh interprets the dreams optimistically. Again the reaction of the unconscious is cheated, and they succeed in bringing back Humbaba's head triumphantly to their city.

[237] Now the gods decide to interfere, or rather it is a goddess, Ishtar, who tries to defeat Gilgamesh. The ultimate principle of the unconscious is the Eternal Feminine, and Ishtar, with true feminine cunning, makes wonderful promises to Gilgamesh if he will become her lover: he would be like a god and his power and wealth would increase beyond measure. But Gilgamesh does not believe a word of it, he refuses with insulting words and reproaches her for all her faithlessness and cruelty towards her lovers. Ishtar in her rage and fury persuades the gods to create an enormous bull, which descends from the heavens and devastates the country. A great fight begins, and hundreds of men are killed by the poisonous breath of the divine bull. But again Gilgamesh, with the help of Enkidu, slays him, and the victory is celebrated.

[238] Ishtar, overcome by rage and pain, descends to the wall of the city, and now Enkidu himself commits an outrage against her. He curses her and throws the member of the dead bull in her face. This is the climax, and now the peripeteia sets in. Enkidu has more dreams of an ominous nature and becomes seriously ill and dies.

[239] This means that the conscious separates from the unconscious altogether; the unconscious withdraws from the field, and Gilgamesh is now alone and overcome with grief. He can hardly accept the loss of his friend, but what torments him most is the fear of death. He has seen his friend die and is faced with the fact that he is mortal too. One more desire tortures him—to secure immortality. He sets out heroically to find the medicine against death, because he knows of an old man, his ancestor, who

has eternal life and who lives far away in the West. So the journey to the underworld, the Nekyia, begins, and he travels to the West like the sun, through the door of the heavenly mountain. He overcomes enormous difficulties, and even the gods do not oppose his plan, although they tell him that he will seek in vain. Finally he comes to his destination and persuades the old man to tell him of the remedy. At the bottom of the sea he acquires the magic herb of immortality, the *pharmakon athanasias*, and he is bringing the herb home. Although he is tired of travelling he is full of joy because he has the wonderful medicine and does not need to be afraid of death any more. But while he is refreshing himself by bathing in a pool, a snake smells out the herb of immortality and steals it from him. After his return, he takes up new plans for the fortification of his city, but he finds no peace. He wants to know what happens to man after death and he finally succeeds in evoking Enkidu's spirit, which comes up from a hole in the earth and gives Gilgamesh very melancholy information. With this the epos ends. The ultimate victory is won by the cold-blooded animal.

[240] There are quite a number of dreams recorded from antiquity with parallel motifs, and I will give you a short example of how our colleagues of old—the dream interpreters of the first century A.D.—proceeded. The story is told by Flavius Josephus in his history of the Jewish war,⁴ where he also records the destruction of Jerusalem.

[241] There was a Tetrarch of Palestine by the name of Archelaos, a Roman governor who was very cruel and who, like practically all of those provincial governors, regarded his position as an opportunity to enrich himself and steal what he could lay his hands on. Therefore a delegation was sent to the emperor Augustus to complain about him. This was in the tenth year of Archelaos' governorship. About this time he had a dream in which he saw nine big ripe ears of wheat which were eaten up by hungry oxen. Archelaos was alarmed and instantly called in his court psychoanalyst. But the psychoanalyst did not know what the dream meant, or he was afraid to tell the truth and wriggled out of it. Archelaos called in other psychoanalysts for consultation, and they in the same way refused to know anything about the dream.

[242] But there was a peculiar sect of people, the Essenes or Therapeutai, with more independent minds. They lived in Egypt and near the Dead Sea, and it is not impossible that John the Baptist as well as Simon Magus belonged to such circles. So as a last resort a man called Simon the Essene was sent for, and he told Archelaos: "The ears of wheat signify the years of your reign, and the oxen the change of things. The nine years are fulfilled and there will be a great change in your fate. The hungry oxen mean your destruction." In those countries such a dream-image would be perfectly understandable. The fields have to be guarded carefully against foraging cattle. There is little grass, and it is a catastrophe when during the night the oxen break through the fence into the field and trample down and eat the growing grain, so

that in the morning the whole bread of a year is gone. Now for the confirmation of the interpretation. A few days later a Roman ambassador arrived to investigate, dismissed Archelaos, took all his property from him, and exiled him to Gaul.

[243] Archelaos was married, and his wife, Glaphyra, also had a dream. Naturally she was impressed by what had happened to her husband. She dreamt of her first husband—Archelaos was her third marriage—who had been disposed of in a very impolite way: he had been murdered, and Archelaos was most probably the murderer. Things were a bit rough in those days. This former husband, Alexandros, appeared to her in the dream and blamed her for her conduct and told her that he was going to take her back into his household. Simon did not interpret this dream, so the analysis is left to our discretion. The important fact is that Alexandros was dead, and that Glaphyra saw the dead husband in her dream. This, of course, in those days, meant the ghost of that person. So when he told her that he was going to take her back to his household it signified that he was going to fetch her to Hades. And indeed, a few days later she committed suicide.

[244] The way the dream-interpreter proceeded with the dream of Archelaos was very sensible. He understood the dream exactly as we would, although these dreams are of a much simpler nature than most of our dreams. I have noticed that dreams are as simple or as complicated as the dreamer is himself, only they are always a little bit ahead of the dreamer's consciousness. I do not understand my own dreams any better than any of you, for they are always somewhat beyond my grasp and I have the same trouble with them as anyone who knows nothing about dream-interpretation. Knowledge is no advantage when it is a matter of one's own dreams.

[245] Another interesting parallel to our case is the story you all know in the fourth chapter of the Book of Daniel.⁵ When the king Nebuchadnezzar had conquered the whole of Mesopotamia and Egypt, he thought he was very great indeed because he possessed the whole known world. Then he had the typical dream of the *arriviste* who has climbed too high. He dreamed of an enormous tree growing up to heaven and casting a shadow over the whole earth. But then a watcher and holy one from heaven ordered the tree to be hewn down, and his branches cut off, and his leaves shaken, so that only his stump remained; and that he should live with the beasts and his human heart be taken from him and a beast's heart given to him.

[246] Of course all the astrologers and wise men and dream-interpreters refused to understand the dream. Only Daniel, who already in the second chapter had proved himself a courageous analyst—he even had a vision of a dream which Nebuchadnezzar could not remember—understood its meaning. He warned the king to repent of his avarice and injustice, otherwise the dream would come true. But the king went on as before, very proud of his power. Then a voice from heaven cursed him and repeated the prophecy of the dream. And it all happened as foretold.

Nebuchadnezzar was cast out to the beasts and he became like an animal himself. He ate grass as the oxen and his body was wet with the dew of heaven, his hair grew long like eagles' feathers and his nails like birds' claws. He was turned back into a primitive man and all his conscious reason was taken away because he had misused it. He regressed even further back than the primitive and became completely inhuman; he was Humbaba, the monster, himself. All this symbolized a complete regressive degeneration of a man who has overreached himself.

[247] His case, like our patient's, is the eternal problem of the successful man who has overreached himself and is contradicted by his unconscious. The contradiction is first shown in the dreams and, if not accepted, must be experienced in reality in a fatal way. These historical dreams, like all dreams, have a *compensatory function*: they are an indication—a symptom, if you prefer to say so—that the individual is at variance with unconscious conditions, that somewhere he has deviated from his natural path. Somewhere he has fallen a victim to his ambition and his ridiculous designs, and, if he does not pay attention, the gap will widen and he will fall into it, as our patient has.

[248] I want to emphasize that it is not safe to interpret a dream without going into careful detail as to the context. Never apply any theory, but always ask the patient how *he* feels about his dream-images. For dreams *are always* about a particular problem of the individual about which he has a wrong conscious judgment. The dreams are the reaction to our conscious attitude in the same way that the body reacts when we overeat or do not eat enough or when we ill-treat it in some other way. *Dreams are the natural reaction of the self-regulating psychic system.* This formulation is the nearest I can get to a theory about the structure and function of dreams. I hold that dreams are just as manifold and unpredictable and incalculable as a person you observe during the day. If you watch an individual at one moment and then at another you will see and hear the most varied reactions, and it is exactly the same with dreams. In our dreams we are just as many-sided as in our daily life, and just as you cannot form a theory about those many aspects of the conscious personality you cannot make a general theory of dreams. Otherwise we would have an almost divine knowledge of the human mind, which we certainly do not possess. We know precious little about it, therefore we call the things we do not know unconscious.

[249] But today I am going to contradict myself and break all my rules. I am going to interpret a single dream, not one out of a series; moreover I do not know the dreamer, and further, I am not in possession of the associations. Therefore I am interpreting the dream arbitrarily. There is a justification for this procedure. If a dream is clearly formed of *personal* material you have to get the individual associations; but if the dream is chiefly a *mythological* structure—a difference which is obvious at once—

then it speaks a universal language, and you or I can supply parallels with which to construct the context as well as anybody else, always provided we possess the necessary knowledge. For instance, when the dream takes up the hero-dragon conflict, everybody has something to say about it, because we have all read fairytales and legends and know something of heroes and dragons. On the collective level of dreams there is practically no difference in human beings, while there is all the difference on the personal level.

[250] The main substance of the dream I am going to speak of is mythological. Here we are confronted with the question: Under what conditions does one have mythological dreams? With us they are rather rare, as our consciousness is to a great extent detached from the underlying archetypal mind. Mythological dreams therefore are felt by us as a very alien element. But this is not so with a mentality nearer to the primordial psyche. Primitives pay great attention to such dreams and call them "big dreams" in contradistinction to ordinary ones. They feel that they are important and contain a general meaning. Therefore in a primitive community the dreamer feels bound to announce a big dream to the assembly of men, and a palaver is held over it. Such dreams were also announced to the Roman Senate. There is a story of a senator's daughter in the first century B.C. who dreamed that the goddess Minerva had appeared to her and complained that the Roman people were neglecting her temple. The lady felt obliged to report the dream to the Senate, and the Senate voted a certain sum of money for the restoration of the temple. A similar case is told of Sophocles, when a precious golden vessel had been stolen from the temple of Herakles. The god appeared to Sophocles in a dream and told him the name of the thief.⁶ After the third repetition of the dream, Sophocles felt obliged to inform the Areopagus. The man in question was seized, and in the course of the investigation he confessed and brought back the vessel. These mythological or collective dreams have a character which forces people instinctively to tell them. This instinct is quite appropriate, because such dreams do not belong to the individual; they have a collective meaning. They are true in themselves in general, and in particular they are true for people in certain circumstances. That is the reason why in antiquity and in the Middle Ages dreams were held in great esteem. It was felt that they expressed a collective human truth.

[251] Now I will tell you the dream. It was sent to me by a colleague of mine years ago with a few remarks about the dreamer. My colleague was an alienist at a clinic, and the patient was a distinguished young Frenchman, twenty-two years of age, highly intelligent, and very aesthetic. He had travelled in Spain and had come back with a depression which was diagnosed as manic-depressive insanity, depressive form. The depression was not very bad, but bad enough for him to be sent to the clinic. After six months he was released from confinement, and a few months later he committed suicide. He was no longer under the depression, which was practically cured; he

committed suicide apparently in a state of calm reasoning. We shall understand from the dream why he committed suicide. This is the dream, and it occurred at the beginning of the depression:

Underneath the great cathedral of Toledo there is a cistern filled with water which has a subterranean connection with the river Tagus, which skirts the city. This cistern is a small dark room. In the water there is a huge serpent whose eyes sparkle like jewels. Near it there is a golden bowl containing a golden dagger. This dagger is the key to Toledo, and its owner commands full power over the city. The dreamer knows the serpent to be the friend and protector of B— C—, a young friend of his who is present. B— C— puts his naked foot into the serpent's jaws. The serpent licks it in a friendly way and B— C— enjoys playing with the serpent; he has no fear of it because he is a child without guile. In the dream B— C— appears to be about the age of seven; he had indeed been a friend of the dreamer's early youth. Since this time, the dream says, the serpent has been forgotten and nobody dared to descend into its haunts.

[252] This part is a sort of introduction, and now the real action begins.

The dreamer is alone with the serpent. He talks to it respectfully, but without fear. The serpent tells the dreamer that Spain belongs to him as he is B— C—'s friend, and asks him to give back the boy. The dreamer refuses to do this and promises instead that he himself will descend into the darkness of the cave to be the friend of the serpent. But then he changes his mind, and instead of fulfilling his promise he decides to send another friend, a Mr. S—, to the serpent. This friend is descended from the Spanish Moors, and to risk the descent into the cistern he has to recover the original courage of his race. The dreamer advises him to get the sword with the red hilt which is to be found in the weapons factory on the other bank of the Tagus. It is said to be a very ancient sword, dating back to the old Phocaeans.⁷ S— gets the sword and descends into the cistern, and the dreamer tells him to pierce his left palm with the sword. S— does so, but he is not able to keep his countenance in the powerful presence of the serpent. Overcome by pain and fear, he cries out and staggers up the stairs again without having taken the dagger. Thus the dreamer cannot hold Toledo, and he could do nothing about it and had to leave his friend there as a mere wall decoration.

[252a]. That is the end of the dream. The original of course is in French. Now for the context. We have certain hints as to these friends. B— C— is a friend of the dreamer's early youth, a little bit older than himself, and he projected everything that was wonderful and charming into this boy and made him a sort of hero. But he lost sight of him later; perhaps the boy died. S— is a friend of more recent date. He is said to be descended from the Spanish Moors. I do not know him personally, but I know his family. It is a very old and honourable family from the South of France, and

the name might easily be a Moorish name. The dreamer knew this legend about the family of S—

[253] As I told you, the dreamer had recently been to Spain and of course had seen Toledo, and he had the dream after he got back and had been taken to the clinic. He was in a bad state, practically in despair, and he could not help telling the dream to his doctor. My colleague did not know what to do with it, but he felt an urge to send me the dream because he felt it to be very important. But at the time I received the dream I could not understand it. Nevertheless I had the feeling; that if I had known something more about such dreams, and if I could have handled the case myself, I might have been able to help the young man and his suicide might not have occurred. Since then I have seen many cases of a similar nature. Often one can turn a difficult corner by a real understanding of dreams like this one. With such a sensitive, refined individual who had studied the history of art and was an unusually artistic and intelligent person, one must be exceedingly careful. Banalities are no use in such a case; one has to be serious and enter into the real material.

[253a] We make no mistake when we assume that the dreamer has picked out Toledo for a particular reason—both as the object of his trip and of his dream; and the dream brings up material which practically everybody would have who had seen Toledo with the same mental disposition, the same education and refinement of aesthetic perception and knowledge. Toledo is an extremely impressive city. It contains one of the most marvellous Gothic cathedrals of the world. It is a place with an immensely old tradition; it is the old Roman Toletum, and for centuries has been the seat of the Cardinal Archbishop and Primate of Spain. From the sixth to the eighth century it was the capital of the Visigoths; from the eighth to the eleventh it was a provincial capital of the Moorish kingdom; and from the eleventh to the sixteenth century it was the capital of Castile. The cathedral of Toledo, being such an impressive and beautiful building, naturally suggests all that it represents: the greatness, the power, the splendour, and the mystery of medieval Christianity, which found its essential expression in the Church. Therefore the cathedral is the embodiment, the incarnation, of the spiritual kingdom, for in the Middle Ages the world was ruled by the Emperor *and* by God. So the cathedral expresses the Christian philosophy or *Weltanschauung* of the Middle Ages.

[254] The dream says that underneath the cathedral there is a mysterious place, which in reality is not in tune with a Christian church. What is beneath a cathedral of that age? There is always the so-called under-church or crypt. You have probably seen the great crypt at Chartres; it gives a very good idea of the mysterious character of a crypt. The crypt at Chartres was previously an old sanctuary with a well, where the worship of a virgin was celebrated—not of the Virgin Mary, as is done now—but of a Celtic goddess. Under every Christian church of the Middle Ages there is a secret

place where in old times the mysteries were celebrated. What we now call the sacraments of the Church were the *mysteria* of early Christianity. In Provençal the crypt is called *le musset*, which means a secret; the word perhaps originates from *mysteria* and could mean mystery-place. In Aosta, where they speak a Provençal dialect, there is a *musset* under the cathedral.

[255] The crypt is probably taken over from the cult of Mithras. In Mithraism the main religious ceremony took place in a vault half sunk into the earth, and the community remained separated in the main church above. There were peepholes so that they could see and hear the priests and the elect ones chanting and celebrating their rites below, but they were not admitted to them. That was a privilege for the initiates. In the Christian church the separation of the baptistry from the main body of the building derives from the same idea, for baptism as well as the communion were *mysteria* of which one could not speak directly. One had to use a sort of allegorical allusion so as not to betray the secrets. The mystery also attached to the name of Christ, which therefore was not allowed to be mentioned; instead, he was referred to by the name of Ichthys, the Fish. You have probably seen reproductions of very early Christian paintings where Christ appears as the Fish. This secrecy connected with the holy name is probably the reason why the name of Christ is not mentioned in an early Christian document of about A.D. 140 known as *The Shepherd* of Hermas,⁸ which was an important part of the body of Christian literature recognized by the Church till about the fifth century. The writer of this book of visions, Hermas, is supposed to have been the brother of the Roman bishop Pius. The spiritual teacher who appears to Hermas is called the Poimen, the Shepherd, and not the Christ.

[256] The idea of the crypt or mystery-place leads us to something below the Christian *Weltanschauung*, something older than Christianity, like the pagan well below the cathedral at Chartres, or like an antique cave inhabited by a serpent. The well with the serpent is of course not an actual fact which the dreamer saw when he travelled in Spain. This dream-image is not an individual experience and can therefore only be paralleled by archaeological and mythological knowledge. I have to give you a certain amount of that parallelism so that you can see in what context or tissue such a symbolical arrangement appears when looked at in the light of comparative research work. You know that every church still has its baptismal font. This was originally the *piscina*, the pond, in which the initiates were bathed or symbolically drowned. After a figurative death in the baptismal bath they came out transformed *quasi modo geniti*, as reborn ones. So we can assume that the crypt or baptismal font has the meaning of a place of terror and death and also of rebirth, a place where dark initiations take place.

[257] The serpent in the cave is an image which often occurs in antiquity. It is important to realize that in classical antiquity, as in other civilizations, the serpent not

only was an animal that aroused fear and represented danger, but also signified healing. Therefore Asklepios, the god of physicians, is connected with the serpent; you all know his emblem which is still in use. In the temples of Asklepios, the Asklepieia, which were the ancient clinics, there was a hole in the ground, covered by a stone, and in that hole lived the sacred serpent. There was a slot in the stone through which the people who came to the place of healing threw down the fee for the doctors. The snake was at the same time the cashier of the clinic and collector of gifts that were thrown down into its cave. During the great pestilence in the time of Diocletian the famous serpent of the Asklepieion at Epidaurus was brought to Rome as an antidote to the epidemic. It represented the god himself.

[258] The serpent is not only the god of healing; it also has the quality of wisdom and prophecy. The fountain of Castalia at Delphi was originally inhabited by a python. Apollo fought and overcame the python, and from that time Delphi was the seat of the famous oracle and Apollo its god, until he left half his powers to Dionysus, who later came in from the East. In the underworld, where the spirits of the dead live, snakes and water are always together, as we can read in Aristophanes' *The Frogs*. The serpent in legend is often replaced by the dragon; the Latin *draco* simply means snake. A particularly suggestive parallel to our dream symbol is a Christian legend of the fifth century about St. Sylvester:⁹ there was a terrible dragon in a cave under the Tarpeian rock in Rome to whom virgins were sacrificed. Another legend says that the dragon was not a real one but artificial, and that a monk went down to prove it was not real and when he got down to the cave he found that the dragon had a sword in his mouth and his eyes consisted of sparkling jewels.

[259] Very often these caves, like the cave of Castalia, contain springs. These springs played a very important role in the cult of Mithras, from which many elements of the early Church originated. Porphyry relates that Zoroaster, the founder of the Persian religion, dedicated to Mithras a cave containing many springs. Those of you who have been to Germany and seen the Saalburg near Frankfurt will have noticed the spring near the grotto of Mithras. The cult of Mithras is always connected with a spring. There is a beautiful Mithraeum in Provence which has a large piscina with wonderful crystal-clear water, and in the background a rock on which is carved the Mithras Tauroktonos—the bull-killing Mithras. These sanctuaries were always a great scandal to the early Christians. They hated all these natural arrangements because they were no friends of nature. In Rome a Mithraeum has been discovered ten feet below the surface of the Church of San Clemente. It is still in good condition but filled with water, and when it is pumped out it fills again. It is always under water because it adjoins a spring which floods the interior. The spring has never been found. We know of other religious ideas in antiquity, for instance of the Orphic cult, which always associate the underworld with water.

[260] This material will give you an idea that the serpent in the cave full of water is an image that was generally known and played a great role in antiquity. As you have noticed, I have chosen all my examples exclusively from antiquity; I could have chosen other parallels from other civilizations, and you would find it was the same. The water in the depths represents the unconscious. In the depths as a rule is a treasure guarded by a serpent or a dragon; in our dream the treasure is the golden bowl with the dagger in it. In order to recover the treasure the dragon has to be overcome. The treasure is of a very mysterious nature. It is connected with the serpent in a strange way; the peculiar nature of the serpent denotes the character of the treasure as though the two things were one. Often there is a golden snake with the treasure. Gold is something that everyone is seeking, so we could say that it looks as if the serpent himself were the great treasure, the source of immense power. In early Greek myths, for instance, the dweller in the cave is a hero, such as Cecrops, the founder of Athens. Above he is half man and half woman, a hermaphrodite, but the lower part of his body is a serpent; he is clearly a monster. The same is said of Erechtheus, another mythical king of Athens.

[261] That prepares us a little for understanding the golden bowl and the dagger in our dream. If you have seen Wagner's *Parsifal* you know that the bowl corresponds to the Grail and the dagger to the spear and that the two belong together; they are the male and the female principle which form the union of opposites. The cave or underworld represents a layer of the unconscious where there is no discrimination at all, not even a distinction between the male and the female, which is the first differentiation primitives make. They distinguish objects in this way, as we still do occasionally. Some keys, for instance, have a hole in the front, and some are solid. They are often called male and female keys. You know the Italian tiled roofs. The convex tiles are placed above and the concave ones underneath. The upper ones are called monks and the under ones the nuns. This is not an indecent joke to the Italians, but the quintessence of discrimination.

[262] When the unconscious brings together the male and the female, things become utterly indistinguishable and we cannot say any more whether they are male or female, just as Cecrops came from such a mythical distance that one could not say whether he was man or woman, human or serpent. So we see that the bottom of the cistern in our dream is characterized by a complete union of opposites. This is the primordial condition of things, and at the same time a most ideal achievement, because it is the union of elements eternally opposed. Conflict has come to rest, and everything is still or once again in the original state of indistinguishable harmony. You find the same idea in ancient Chinese philosophy. The ideal condition is named Tao, and it consists of the complete harmony between heaven and earth. Figure 13 represents the symbol for Tao. On one side it is white with a black spot, and on the

other it is black with a white spot. The white side is the hot, dry, fiery principle, the south; the black side is the cold, humid, dark principle, the north. The condition of Tao is the beginning of the world where nothing has yet begun—and it is also the condition to be achieved by the attitude of superior wisdom. The idea of the union of the two opposite principles, of male and female, is an archetypal image. I once had a very nice example of its still-living primitive form. When on military duty with the army during the war, I was with the mountain artillery, and the soldiers had to dig a deep hole for the position of a heavy gun. The soil was very refractory, and they cursed a good deal while they were digging up the heavy blocks. I was sitting hidden behind a rock, smoking my pipe and listening to what they said. One man said: “Now, damn it all, we have dug into the depths of this blooming old valley where the old lake-dwellers lived and where father and mother are still sleeping together.” That is the same idea, very naïvely expressed. A Negro myth says that the primordial man and the primordial woman were sleeping together in the calabash; they were quite unconscious until they found they were torn asunder and what was in between was the son. Man was in between, and from that time they were separated, and then they knew each other. The original condition of absolute unconsciousness is expressed as a completely restful condition where nothing happens.

FIG. 13. Tao

[263] When the dreamer comes to these symbols he reaches the layer of complete unconsciousness, which is represented as the greatest treasure. It is the central motif in Wagner's *Parsifal* that the spear should be restored to the Grail because they belong eternally together. This union is a symbol of complete fulfilment—eternity before and after the creation of the world, a dormant condition. That is probably the thing which the desire of man is seeking. That is why he ventures into the cave of the dragon, to find that condition where consciousness and the unconscious are so completely united that he is neither conscious nor unconscious. Whenever the two are too much separated, consciousness seeks to unite them again by going down into the depths where they once were one. Thus you find in Tantric Yoga or Kundalini Yoga an attempt to reach the condition where Shiva is in eternal union with Shakti. Shiva is the eternally unextended point, and he is encircled by the female principle, Shakti, in the form of a serpent.

[264] I could give you many more instances of this idea. It played a great role in the secret tradition of the Middle Ages. In medieval alchemical texts there are pictures of the process of the union of Sol and Luna, the male and the female principle. We have traces of an analogous symbolism in Christian reports about the ancient mysteries. There is a report by a Bishop Asterios about Eleusis, and it says that every year the priest made the *katabasis* or descent into the cave. And the priest of Apollo and the priestess of Demeter, the earth mother, celebrated the *hierosgamos*, the sacred nuptials, for the fertilization of the earth. This is a Christian statement which is not substantiated. The initiates of the Eleusinian mysteries were sworn to the strictest secrecy; if they betrayed anything, they were punished with death. So we have practically no knowledge of their rites. We know, on the other hand, that during the mysteries of Demeter certain obscenities took place because they were thought good for the fertility of the earth. The distinguished ladies of Athens assembled, with the priestess of Demeter presiding. They had a good meal and plenty of wine and afterwards performed the rite of the *aischrologia*. That is, they had to tell indecent jokes. This was considered a religious duty because it was good for the fertility of the next season.¹⁰ A similar rite took place in Bubastis in Egypt at the time of the Isis mysteries. The inhabitants of the villages on the upper Nile came down in parties, and the women on the barges used to expose themselves to the women on the banks of the Nile. It was probably done for the same reason as the *aischrologia*, to ensure the fertility of the earth. You can read about it in Herodotus.¹¹ In southern Germany as late as the nineteenth century, in order to increase the fertility of the soil, the peasant used to take his wife to his fields and have intercourse with her in a furrow. This is called sympathetic magic.

[265] The bowl is a vessel that receives or contains, and is therefore female. It is a symbol of the body which contains the anima, the breath and liquid of life, while the dagger has piercing, penetrating qualities and is therefore male. It cuts, it discriminates and divides, and so is a symbol of the masculine Logos principle.

[266] In our dream the dagger is said to be the key to Toledo. The idea of the key is often associated with the mysteries in the cave. In the cult of Mithras there is a peculiar kind of god, the key god Aion, whose presence could not be explained; but I think it is quite understandable. He is represented with the winged body of a man and the head of a lion, and he is encoiled by a snake which rises up over his head.¹² You have a figure of him in the British Museum. He is Infinite Time and Long Duration; he is the supreme god of the Mithraic hierarchy and creates and destroys all things, the *durée créatrice* of Bergson. He is a sun-god. Leo is the zodiacal sign where the sun dwells in summer, while the snake symbolizes the winter or wet time. So Aion, the lion-headed god with the snake round his body, again represents the union of opposites, light and darkness, male and female, creation and destruction. The god is

represented as having his arms crossed and holding a key in each hand. He is the spiritual father of St. Peter, for he too holds the keys. The keys which Aion is holding are the keys to the past and future.

[267] The ancient mystery cults are always connected with psychopompic deities. Some of these deities are equipped with the keys to the underworld, because as the guardians of the door they watch over the descent of the initiates into the darkness and are the leaders into the mysteries. Hecate is one of them.

[268] In our dream the key is the key to the city of Toledo, so we have to consider the symbolic meaning of Toledo and of the city. As the old capital of Spain, Toledo was a very strong fortification and the very ideal of a feudal city, a refuge and stronghold which could not easily be touched from outside. The city represents a totality, closed in upon itself, a power which cannot be destroyed, which has existed for centuries and will exist for many centuries more. Therefore the city symbolizes the totality of man, an attitude of wholeness which cannot be dissolved.

[269] The city as a synonym for the self, for psychic totality, is an old and well-known image. We read for instance in the Oxyrhynchus sayings of Jesus:¹³ “A city built upon the top of a high hill and stablished, can neither fall nor be hid.” And: “Strive therefore to know yourselves, and ye shall be aware that ye are the sons of the almighty Father; and ye shall know that ye are in the city of God and ye are the city.” There is a Coptic treatise in the Codex Brucianus in which we find the idea of the Monogenes, or only son of God, who is also the Anthropos, Man.¹⁴ He is called the city with the four gates. The city with the four gates symbolizes the idea of totality; it is the individual who possesses the four gates to the world, the four psychological functions, and so is contained in the self. The city with the four gates is his indestructible wholeness—consciousness and the unconscious united.

[270] So these depths, that layer of utter unconsciousness in our dream, contain at the same time the key to individual completeness and wholeness, in other words to healing. The meaning of “whole” or “wholeness” is to make holy or to heal. The descent into the depths will bring healing. It is the way to the total being, to the treasure which suffering mankind is forever seeking, which is hidden in the place guarded by terrible danger. This is the place of primordial unconsciousness and at the same time the place of healing and redemption, because it contains the jewel of wholeness. It is the cave where the dragon of chaos lives and it is also the indestructible city, the magic circle or *temenos*, the sacred precinct where all the split-off parts of the personality are united.

[271] The use of a magic circle or mandala, as it is called in the East, for healing purposes is an archetypal idea. When a man is ill the Pueblo Indians of New Mexico make a sand-painting of a mandala with four gates. In the centre of it they build the so-called sweat-house or medicine-lodge, where the patient has to undergo the sweat-

cure. On the floor of the medicine-lodge is painted another magic circle—being thus placed in the centre of the big mandala—and in the midst of it is the bowl with the healing water. The water symbolizes the entrance to the underworld. The healing process in this ceremony is clearly analogous to the symbolism which we find in the collective unconscious. It is an individuation process, an identification with the totality of the personality, with the self. In Christian symbolism the totality is Christ, and the healing process consists of the *imitatio Christi*. The four gates are replaced by the four arms of the cross.

[272] The serpent in the cave in our dream is the friend of B— C—, the hero of the dreamer's early days, into whom he projected everything he wanted to become and all the virtues to which he was aspiring. That young friend is at peace with the serpent. He is a child without guile, he is innocent and knows as yet of no conflict. Therefore he has the key to Spain and the power over the four gates.¹⁵

Discussion

Dr. David Yellowlees:

[273] I need hardly mention that I shall not attempt to discuss anything that has been said tonight. We are all glad Professor Jung has given us such an extraordinarily fascinating account of his own views, rather than spend time on controversial matters. But I think some of us would be grateful if he would recognize that we approach psychology and psychotherapy along lines not exclusively Freudian perhaps, but in accordance with certain fundamental principles with which Freud's name is associated, though he may not have originated them. We are very grateful that Professor Jung has given us what we believe to be a wider view. Some of us prefer that view, and perhaps the Freudians would be able to tell us why. But the question was raised the other night as to the relationship between the concept of the unconscious which Professor Jung has been laying before us and Freud's concept of it, and I think if Professor Jung will be so good he could help us a little in that direction. I know quite well I may be misinterpreting him, but the impression I got on Tuesday night was almost as if he had said that he was dealing with facts and Freud with theories. He knows as well as I do that this bald statement really requires some amplification and I wish he could tell us, for example, what we ought to do from a therapeutic point of view when faced with a patient who produces spontaneously what I would call Freudian material, and how far we should regard Freudian theories simply as theories in view of the evidence which can be proved by such material as infantile fixation of the libido—oral, anal, phallic, and so on. If Professor Jung would say a little to give us some kind of correlation we would be very grateful.

Professor Jung:

[274] I told you at the beginning that I do not want to be critical. I just want to give you a point of view of my own, of how I envisage psychological material, and I suppose that when you have heard what I have to contribute you will be able to make up your minds about these questions, and how much of Freud, how much of Adler, or myself, or I do not know whom, you will want to follow. If you want me to elucidate the question of the connection with Freud, I am quite glad to do it. I started out entirely on Freud's lines. I was even considered to be his best disciple. I was on excellent terms with him until I had the idea that certain things are symbolical. Freud would not agree to this, and he identified his method with the theory and the theory with the method. That is impossible, you cannot identify a method with science. I said that in view of these things I could not keep on publishing the *Jahrbuch*¹⁵ and I withdrew.

[275] But I am perfectly well aware of the merits of Freud and I do not want to diminish them. I know that what Freud says agrees with many people, and I assume that these people have exactly the kind of psychology that he describes. Adler, who has entirely different views, also has a large following, and I am convinced that many people have an Adlerian psychology. I too have a following—not so large as Freud's—and it consists presumably of people who have my psychology. I consider my contribution to psychology to be my subjective confession. It is my personal psychology, my prejudice that I see psychological facts as I do. I admit that I see things in such and such a way. But I expect Freud and Adler to do the same and confess that their ideas are their subjective point of view. So far as we admit our personal prejudice, we are really contributing towards an objective psychology. We cannot help being prejudiced by our ancestors, who want to look at things in a certain way, and so we instinctively have certain points of view. It would be neurotic if I saw things in another way than my instinct tells me to do; my snake, as the primitives say, would be all against me. When Freud said certain things, my snake did not agree. And I take the route that my snake prescribes, because that is good for me. But I have patients with whom I have to make a Freudian analysis and go into all the details which Freud has correctly described. I have other cases that force me to an Adlerian point of view, because they have a power complex. People who have the capacity to adapt and are successful are more inclined to have a Freudian psychology, because a man in that position is looking for the gratification of his desires, while the man who has not been successful has no time to think about desires. He has only one desire—to succeed, and he will have an Adlerian psychology, because a man who always falls into the second place will develop a power complex.

[276] I have no power complex in that sense because I have been fairly successful and in nearly every respect I have been able to adapt. If the whole world disagrees with me it is perfectly indifferent to me. I have a perfectly good place in Switzerland, I enjoy myself, and if nobody enjoys my books I enjoy them. I know nothing better than being in my library, and if I make discoveries in my books, that is wonderful. I cannot say I have a Freudian psychology because I never had such difficulties in relation to desires. As a boy I lived in the country and took things very naturally, and the natural and unnatural things of which Freud speaks were not interesting to me. To talk of an incest complex just bores me to tears. But I know exactly how I could make myself neurotic: if I said or believed something that is not myself. I say what I see, and if somebody agrees with me it pleases me and if nobody agrees it is indifferent to me. I can join neither the Adlerian nor the Freudian confession. I can agree only with the Jungian confession because I see things that way even if there is not a single person on earth who shares my views. The only thing I hope for is to give you some interesting ideas and let you see how I tackle things.

[277] It is always interesting to me to see a craftsman at work. His skill makes the charm of a craft. Psychotherapy is a craft and I deal in my individual way—a very humble way with nothing particular to show—with the things I have to do. Not that I believe for a moment that I am absolutely right. Nobody is absolutely right in psychological matters. Never forget that in psychology the *means* by which you judge and observe the psyche is the *psyche* itself. Have you ever heard of a hammer beating itself? In psychology the observer is the observed. The psyche is not only the *object* but also the *subject* of our science. So you see, it is a vicious circle and we have to be very modest. The best we can expect in psychology is that everybody puts his cards on the table and admits: “I handle things in such and such a way, and this is how I see them.” Then we can compare notes.

[278] I have always compared notes with Freud and Adler. Three books have been written by pupils of mine who tried to give a synopsis of the three points of view.¹⁶ You have never heard this from the other side. That is our Swiss temperament. We are liberal and we try to see things side by side, together. From my point of view the best thing is to say that obviously there are thousands of people who have a Freudian psychology and thousands who have an Adlerian psychology. Some seek gratification of desire and some others fulfilment of power and yet others want to see the world as it is and leave things in peace. We do not want to change anything. The world is good as it is.

[279] There are many different psychologies in existence. A certain American university, year after year, issues a volume of the psychologies of 1934, 1935, and so on. There is a total chaos in psychology, so do not be so frightfully serious about psychological theories. Psychology is not a religious creed but a point of view, and when we are human about it we may be able to understand each other. I admit that some people have sexual trouble and others have other troubles. I have chiefly other troubles. You now have an idea of how I look at things. My problem is to wrestle with the big monster of the historical past, the great snake of the centuries, the burden of the human mind, the problem of Christianity. It would be so much simpler if I knew nothing; but I know too much, through my ancestors and my own education. Other people are not worried by such problems, they do not care about the historical burdens Christianity has heaped upon us. But there are people who are concerned with the great battle between the present and the past or the future. It is a tremendous human problem. Certain people make history and others build a little house in the suburbs. Mussolini’s case is not settled by saying he has a power complex. He is concerned with politics, and that is his life and death. The world is huge and there is not one theory only to explain everything.

[280] To Freud the unconscious is chiefly a receptacle for things repressed. He looks at it from the corner of the nursery. To me it is a vast historical storehouse. I

acknowledge I have a nursery too, but it is small in comparison with the vast spaces of history which were more interesting to me from childhood than the nursery. There are many people like myself, I am optimistic in that respect. Once I thought there were no people like myself; I was afraid it was megalomania to think as I did. Then I found many people who fitted in with my point of view, and I was satisfied that I represented perhaps a minority of people whose basic psychological facts are expressed more or less happily by my formulation, and when you get these people under analysis you will find they do not agree with Freud's or Adler's point of view, but with mine. I have been reproached for my naïveté. When I am not sure about a patient I give him books by Freud and Adler and say, "Make your choice," in the hope that we are going on the right track. Sometimes we are on the wrong track. As a rule, people who have reached a certain maturity and who are philosophically minded and fairly successful in the world and not too neurotic, agree with my point of view. But you must not conclude from what I present to you that I always lay my cards on the table and tell the patient all I mention here. Time would not allow me to go into all those details of interpretation. But a few cases need to acquire a great amount of knowledge and are grateful when they see a way to enlarge their point of view.

[281] I cannot say where I could find common ground with Freud when he calls a certain part of the unconscious the Id. Why give it such a funny name? It is the unconscious and that is something we do not know. Why call it the Id? Of course the difference of temperament produces a different outlook. I never could bring myself to be so frightfully interested in these sex cases. They do exist, there are people with a neurotic sex life and you have to talk sex stuff with them until they get sick of it and you get out of that boredom. Naturally, with my temperamental attitude, I hope to goodness we shall get through with the stuff as quickly as possible. It is neurotic stuff and no reasonable normal person talks of it for any length of time. It is not natural to dwell on such matters. Primitives are very reticent about them. They allude to sexual intercourse by a word that is equivalent to "hush." Sexual things are taboo to them, as they really are to us if we are natural. But taboo things and places are always apt to be the receptacle for all sorts of projections. And so very often the real problem is not to be found there at all. Many people make unnecessary difficulties about sex when their actual troubles are of quite a different nature.

[282] Once a young man came to me with a compulsion neurosis. He brought me a manuscript of his of a hundred and forty pages, giving a complete Freudian analysis of his case. It was quite perfect according to the rules, it could have been published in the *Jahrbuch*. He said: "Will you read this and tell me why I am not cured although I made a complete psychoanalysis?" I said: "So you have, and I do not understand it either. You ought to be cured according to all the rules of the art, but when you say you are not cured I have to believe you." He repeated: "Why am I not cured, having a

complete insight into the structure of my neurosis?" I said: "I cannot criticize your thesis. The whole thing is marvellously well demonstrated. There remains only one, perhaps quite foolish, question: you do not mention where you come from and who your parents are. You say you spent last winter on the Riviera and the summer in St. Moritz. Were you very careful in the choice of your parents?" "Not at all." "You have an excellent business and are making a good deal of money?" "No, I cannot make money." "Then you have a big fortune from an uncle?" "No." "Then where does the money come from?" He replied: "I have a certain arrangement. I have a friend who gives me the money." I said: "It must be a wonderful friend," and he replied, "It is a woman." She was much older than himself, aged thirty-six, a teacher in an elementary school with a small salary, who, as an elderly spinster, fell in love with the fellow who was twenty-eight. She lived on bread and milk so that he could spend his winter on the Riviera and his summer in St. Moritz. I said: "And you ask why you are ill!" He said: "Oh, you have a moralistic point of view; that is not scientific." I said: "The money in your pocket is the money of the woman you cheat." He said, "No, we agreed upon it. I had a serious talk with her and it is not a matter for discussion that I get the money from her." I said: "You are pretending to yourself that it is not her money, but you live by it, and that is immoral. That is the cause of your compulsion neurosis. It is a compensation and a punishment for an immoral attitude." An utterly unscientific point of view, of course, but it is my conviction that he deserves his compulsion neurosis and will have it to the last day of his life if he behaves like a pig.

Dr. T. A. Ross:

[283] Did not that come out in the analysis?

Professor Jung:

[284] He went right away like a god and thought: "Dr. Jung is only a moralist, not a scientist. Anybody else would have been impressed by the interesting case instead of looking for simple things." He commits a crime and steals the savings of a lifetime from an honest woman in order to be able to have a good time. That fellow belongs in gaol, and his compulsion neurosis provides it for him all right.

Dr. P. W. L. Camps:

[285] I am a humble general practitioner, not a psychologist, and may be labelled as a suburban villa. I am an outsider in this place. The first night I thought I had no right to be here; the second night I was here again; the third night I was glad to be here; and the fourth night I am in a maze of mythology.

[286] I would like to ask something about last night. We were sent away with the idea that perfection was most undesirable and completion the end and aim of existence. I slept soundly last night but I felt that I had had an ethical shock. Perhaps I am not gifted with much intellect and it was an intellectual shock too. Professor Jung declares himself a determinist or fatalist. After he had analysed a young man who went away disappointed and then went to bits, Professor Jung felt it was only right that he should go to bits. You as psychologists, I take it, are endeavouring to cure people, and you have a purpose in life, not merely to enjoy your interests, whether it be mythology or the study of human nature. You want to get at the bottom of human nature and try to build it up to something better.

[287] I listened with the greatest interest to Professor Jung's simple English terms and rejoiced in them. I have been confounded with all this new terminology. To hear of our sensation and thinking and feeling and intuition—to which possibly an X may be added for something else—was most illuminating to me as an ordinary individual.

[288] But I feel that we did not hear where the conscious or rather where the unconscious of the child develops. I fear that we did not hear enough about children. I should like to ask Professor Jung where the unconscious in the child does become the conscious.

[289] I should also like to know whether we are not misled some what by this multitude of diagrams, barriers, Egos, and Ids, and other things I have seen portrayed; whether we could not improve on these diagrams by having a gradation of stages.

[290] As Professor Jung has pointed out, we have inherited faces and eyes and ears and there are a multitude of faces and in psychology there are a multitude of types also. Is it not reasonable to suppose that there is an enormous possibility of varieties planted on that inheritance, that they are a sort of mesh, a sieve as it were, that will receive impressions and select them in the unconscious years of early life and reach through into consciousness later? I should like to ask Professor Jung whether these thoughts have crossed the mind of an eminent psychologist such as he is—the very greatest psychologist in my view—tonight?

Professor Jung:

[291] After that severe reproach for immorality I owe an explanation of my cynical remarks of yesterday. I am not as bad as all that. I naturally try to do my best for my patients, but in psychology it is very important that the doctor should not strive to heal at all costs. One has to be exceedingly careful not to impose one's own will and conviction on the patient. We have to give him a certain amount of freedom. You can't wrest people away from their fate, just as in medicine you cannot cure a patient if nature means him to die. Sometimes it is really a question whether you are allowed

to rescue a man from the fate he must undergo for the sake of his further development. You cannot save certain people from committing terrible nonsense because it is in their grain. If I take it away they have no merit. We only gain merit and psychological development by accepting ourselves as we are and by being serious enough to live the lives we are trusted with. Our sins and errors and mistakes are necessary to us, otherwise we are deprived of the most precious incentives to development. When a man goes away, having heard something which might have changed his mind, and does not pay attention, I do not call him back. You may accuse me of being unchristian, but I do not care. I am on the side of nature. The old Chinese Book of Wisdom says: "The Master says it once." He does not run after people, it is no good. Those who are meant to hear will understand, and those who are not meant to understand will not hear.

[292] I was under the impression that my audience consisted chiefly of psychotherapists. If I had known that medical men were present I would have expressed myself more civilly. But psychotherapists will understand. Freud—to quote the master's own words—says it is not good to try to cure at all costs. He often repeated that to me, and he is right.

[293] Psychological truths are two-edged, and whatever I say can be used in such a way that it can work the greatest evil, the greatest devastation and nonsense. There is not one statement I have made which has not been twisted into its opposite. So I do not insist on any statement. You can take it, but if you do not take it, all right. You may perhaps blame me for that, but I trust that there is a will to live in everybody which will help them to choose the thing that is right for them. When I am treating a man I must be exceedingly careful not to knock him down with my views or my personality, because he has to fight his lonely fight through life and he must be able to trust in his perhaps very incomplete armour and in his own perhaps very imperfect aim. When I say, "That is not good and should be better," I deprive him of courage. He must plough his field with a plough that is not good perhaps: mine may be better, but what good is it to him? He has not got my plough. I have it and he cannot borrow it; he must use his own perhaps very incomplete tools and has to work with his own inherited capacities, whatever they are. I help him of course, I may say for instance: "Your thinking is perfectly good, but perhaps in another respect you could improve." If he does not want to hear it, I shall not insist because I do not want to make him deviate.

Dr. Marion Mackenzie:

[294] In the same way that the rich young man was not called back but went away sorrowful?

Professor Jung:

[295] Yes, it is the same technique. If I were to say to a man, “You should not go away.” he would never come back. I have to say, “Have your own way.” Then he will trust me.

[296] As to the question about children, there has been in the last decades such a noise about children that I often scratch my head at a meeting and say: “Are they all midwives and nurses?” Does not the world consist chiefly of parents and grandparents? The adults have the problems. Leave the poor children alone. I get the mother by the ears and not the child. The parents make the neuroses of children.

[297] It is certainly interesting to make researches into the development of consciousness. The beginning of consciousness is a fluid condition, and you cannot say when the child has become really conscious and when it has not yet. But that belongs to an entirely different chapter: the psychology of the ages. There is a psychology of childhood, which apparently consists in the psychology of the respective parents; a psychology from infancy to puberty; a psychology of puberty, of the young man, of the adult man of thirty-five, of the man in the second half of life, of the man in old age. That is a science in itself, and I could not possibly bring in all that too. I have a most difficult time as it is to illustrate one single dream. Science is large. It is as if you expected a physicist, when he talks of the theory of light, to elucidate at the same time the whole of mechanical physics. It is simply not possible. Psychology is not an introductory course for nurses; it is a very serious science and consists of a heap of knowledge, so you should not expect too much from me. I am doing my level best to grapple with dreams and to tell you something about them, and I naturally cannot fulfil all expectations.

[298] As to the question about perfection: to strive for perfection is a high ideal. But I say: “Fulfil something you are able to fulfil rather than run after what you will never achieve.” Nobody is perfect. Remember the saying: “None is good but God alone,”¹⁷ and nobody can be. It is an illusion. We can modestly strive to fulfil ourselves and to be as complete human beings as possible, and that will give us trouble enough.

Dr. Eric B. Strauss:

[299] Does Professor Jung intend to publish the reasons which led him to identify certain archetypal symbols with physiological processes?

Professor Jung:

[300] The case you refer to was submitted to me by Dr. Davie, and afterwards he published it without my knowledge.¹⁸ I do not wish to say more about this correlation

because I do not yet feel on very safe ground. Questions of differential diagnosis between organic disease and psychological symbols are very difficult, and I prefer not to say anything about it for the time being.

Dr. Strauss:

[301] But your diagnosis was made from the facts of the dream?

Professor Jung:

[302] Yes, because the organic trouble disturbed the mental functioning. There was a serious depression and presumably a profound disturbance of the sympathetic system.

Dr. H. Crichton-Miller:

[303] Tomorrow is the last seminar, and there is a point that interests us that has not been referred to. That is the difficult problem of transference. I wonder if Professor Jung would think it proper to give us his view tomorrow—without dealing necessarily with other schools—as to transference and the proper handling of it?

LECTURE V

The Chairman (Dr. J. R. Rees):

[304] Ladies and Gentlemen: You will have noticed that the Chairman's remarks have been growing shorter each evening. Yesterday Professor Jung was in the middle of a continuous story, and I think we all want him to get on with it straight away.

Professor Jung:

[305] Ladies and Gentlemen: You remember that I began to give you the material belonging to this dream. I am now in the middle of it and there is a great more to come. But at the end of yesterday's lecture I was asked by Dr. Crichton-Miller to speak about the problem of transference. That showed me something which seems to be of practical interest. When I analyse such a dream carefully and put in a great deal of work, it often happens that my colleagues wonder why I am heaping up such a quantity of learned material. They think, "Well, yes, it shows his zeal and his goodwill to make something of a dream. But what is the practical use of all these parallels?"

[306] I do not mind these doubts in the least. But I was really just about to bring in something belonging to the problem, and Dr. Crichton-Miller has caught me in this attempt and asked just that question which any practical doctor would ask. Practical doctors are troubled by practical problems, and not by theoretical questions; therefore they always get a bit impatient when it comes to theoretical elucidations. They are particularly troubled by the half-amusing, half-painful, even tragic problems of transference. If you had been a little bit more patient, you would have seen that I was handling the very material by which transference can be analysed. But since the question has been raised I think I should rather give way to your wish and talk about the psychology and treatment of transference. But the choice is up to you. My feeling was that Dr. Crichton-Miller had spoken the mind of the majority of you. Am I right in this assumption?

Members:

[307] Yes.

Professor Jung:

[308] I think you are right in your decision, for if I am going to speak about transference I shall have the opportunity to lead back to what I had originally intended with the analysis of that dream. I am afraid we will not have time to finish it; but I think it is better if I start from your actual problems and your actual difficulties.

[309] I would never have been forced to work out that elaborate symbolism and this careful study of parallels if I had not been terribly worried by the problem of transference. So, in discussing the question of transference, an avenue will open to the kind of work I was trying to describe to you in my lecture last night. I told you in the beginning that my lectures will be a sorry torso. I am simply unable, in five evenings, even if I compress things together as I have done, to give you a complete summary of what I have to tell.

[310] Speaking about the transference makes it necessary first to define the concept so that we really understand what we are talking about. You know that the word transference, originally coined by Freud, has become a sort of colloquial term; it has even found its way into the larger public. One generally means by it an awkward hanging-on, an adhesive sort of relationship.

[311] The term “transference” is the translation of the German word *Übertragung*. Literally *Übertragung* means: to carry something over from one place to another. The word *Übertragung* is also used in a metaphorical sense to designate the carrying over from one form into another. Therefore in German it is synonymous with *Übersetzung*—that is, translation.

[312] The psychological process of transference is a specific form of the more general process of projection. It is important to bring these two concepts together and to realize that transference is a special case of projection—at least that is how I understand it. Of course, everybody is free to use the term in his own way.

[313] Projection is a general psychological mechanism that carries over subjective contents of any kind into the object. For instance, when I say, “The colour of this room is yellow,” that is a projection, because in the object itself there is no yellow; yellow is only in us. Colour is our subjective experience as you know. The same when I hear a sound, that is a projection, because sound does not exist in itself; it is a sound in my head, it is a psychic phenomenon which I project.

[314] Transference is usually a process that happens between two people and not between a human subject and a physical object, though there are exceptions; whereas the more general mechanism of projection, as we have seen, can just as well extend to physical objects. The mechanism of projection, whereby subjective contents are carried over into the object and appear as if belonging to it, is never a voluntary act, and transference, as a specific form of projection, is no exception to this rule. You cannot consciously and intentionally project, because then you know all the time that

you are projecting your subjective contents; therefore you cannot locate them in the object, for you know that they really belong to you. In projection the apparent fact you are confronted with in the object is in reality an illusion; but you assume what you observe in the object not to be subjective, but objectively existing. Therefore, a projection is abolished when you find out that the apparently objective facts are really subjective contents. Then these contents become associated with your own psychology, and you cannot attribute them to the object any more.

[315] Sometimes one is apparently quite aware of one's projections though one does not know their full extent. And that portion of which one is not aware remains unconscious and still appears as if belonging to the object. This often happens in practical analysis. You say, for instance: "Now, look here, you simply project the image of your father into that man, or into myself," and you assume that this is a perfectly satisfactory explanation and quite sufficient to dissolve the projection. It is satisfactory to the doctor, perhaps, but not to the patient. Because, if there is still something more in that projection, the patient will keep on projecting. It does not depend upon his will; it is simply a phenomenon that produces itself. Projection is an automatic, spontaneous fact. It is simply there; you do not know how it happens. You just find it there. And this rule, which holds good for projection in general, is also true of transference. Transference is something which is just there. If it exists at all, it is there *a priori*. Projection is always an *unconscious* mechanism, therefore consciousness, or conscious realization, destroys it.

[316] Transference, strictly, as I have already said, is a projection which happens between two individuals and which, as a rule, is of an emotional and compulsory nature. Emotions in themselves are always in some degree overwhelming for the subject, because they are involuntary conditions which override the intentions of the ego. Moreover, they cling to the subject, and he cannot detach them from himself. Yet this involuntary condition of the subject is at the same time projected into the object, and through that a bond is established which cannot be broken, and exercises a compulsory influence upon the subject.

[317] Emotions are not detachable like ideas or thoughts, because they are identical with certain physical conditions and are thus deeply rooted in the heavy matter of the body. Therefore the emotion of the projected contents always forms a link, a sort of dynamic relationship, between the subject and the object—and that is the transference. Naturally, this emotional link or bridge or elastic string can be positive or negative, as you know.

[318] The projection of emotional contents always has a peculiar influence. Emotions are contagious, because they are deeply rooted in the sympathetic system; hence the word "sympathicus." Any process of an emotional kind immediately arouses similar processes in others. When you are in a crowd which is moved by an emotion, you

cannot fail to be roused by that same emotion. Suppose you are in a country where a language is spoken which you don't understand, and somebody makes a joke and people laugh, then you laugh too in an idiotic way, simply because you can't refrain from laughing. Also when you are in a crowd which is politically excited you can't help being excited too, even when you do not share their opinion at all, because emotion has this suggestive effect. The French psychologists have dealt with this "contagion mentale"; there are some very good books on the subject, especially *The Crowd: A Study of the Popular Mind*, by Le Bon.

[319] In psychotherapy, even if the doctor is entirely detached from the emotional contents of the patient, the very fact that the patient has emotions has an effect upon him. And it is a great mistake if the doctor thinks he can lift himself out of it. He cannot do more than become conscious of the fact that he is affected. If he does not see that, he is too aloof and then he talks beside the point. It is even his duty to accept the emotions of the patient and to mirror them. That is the reason why I reject the idea of putting the patient upon a sofa and sitting behind him. I put my patients in front of me and I talk to them as one natural human being to another, and I expose myself completely and react with no restriction.

[320] I remember very well a case of an elderly woman of about fifty-eight—a doctor too—from the United States. She arrived in Zurich in a state of utter bewilderment. She was so confused at first I thought her half crazy, until I discovered that she had been in an analysis. She told me certain things she had done in her bewilderment, and it was quite obvious that she would never have done these things if her analyst had been a human being and not a mystical cipher who was sitting behind her, occasionally saying a wise word out of the clouds and never showing an emotion. So she got quite lost in her own mists and did some foolish things which he could easily have prevented her from doing if he had behaved like a human being. When she told me all that, I naturally had an emotional reaction and swore, or something like that. Upon which she shot out of her chair and said reproachfully, "But you have an emotion!" I answered, "Why, of course I have an emotion." She said, "But you should not have an emotion." I replied, "Why not? I have a good right to an emotion." She objected, "But you are an analyst!" I said, "Yes, I am an analyst, and I have emotions. Do you think that I am an idiot or a catatonic?" "But analysts have no emotions." I remarked, "Well, your analyst apparently had no emotions, and, if I may say so, he was a fool!" That one moment cleared her up completely; she was absolutely different from then on. She said, "Thank heaven! Now I know where I am. I know there is a human being opposite me who has human emotions!" My emotional reaction had given her orientation. She wasn't a thinking type, she was a feeling type and therefore needed that kind of orientation. But her analyst was a man who simply thought and existed in his intellect, and had no connection with her feeling-life. She

was a highly emotional sanguine sort of person who needed the emotionality and the feeling gesture of another human being in order not to feel alone. When you have to treat a feeling type and you talk intellectual stuff exclusively it is the same as if you, as the only intellectual, were talking to a company of feeling types. You would be utterly lost; you would feel as if you were at the North Pole, because you wouldn't be understood; nobody would react to your ideas. People would all be frightfully nice—and you would feel utterly foolish because they would not respond to your way of thinking.

[321] One always has to answer people in their main function, otherwise no contact is established. So, in order to be able to show my patients that their reactions have arrived in my system, I have to sit opposite them so that they can read the reactions in my face and can see that I am listening. If I sit behind them, then I can yawn, I can sleep, I can go off on my own thoughts, and I can do what I please. They never know what is happening to me, and then they remain in an auto-erotic and isolated condition which is not good for ordinary people. Of course, if they were going to prepare for an existence as hermits on the Himalayas, it would be a different matter.

[322] The emotions of patients are always slightly contagious, and they are very contagious when the contents which the patient projects into the analyst are identical with the analyst's own unconscious contents. Then they both fall into the same dark hole of unconsciousness, and get into the condition of participation. This is the phenomenon which Freud has described as countertransference. It consists of mutual projecting into each other and being fastened together by mutual unconsciousness. Participation, as I have told you, is a characteristic of primitive psychology, that is, of a psychological level where there is no conscious discrimination between subject and object. Mutual unconsciousness is of course most confusing both to the analyst and to the patient; all orientation is lost, and the end of such an analysis is disaster.

[323] Even analysts are not absolutely perfect, and it can happen that they are occasionally unconscious in certain respects. Therefore long ago I stipulated that analysts ought to be analysed themselves: they should have a father confessor or a mother confessor. Even the Pope, for all his infallibility, has to confess regularly, and not to a monsignor or a cardinal but to an ordinary priest. If the analyst does not keep in touch with his unconscious objectively, there is no guarantee whatever that the patient will not fall into the unconscious of the analyst. You probably all know certain patients who possess a diabolical cunning in finding out the weak spot, the vulnerable place in the analyst's psyche. To that spot they seek to attach the projections of their own unconscious. One usually says that it is a characteristic of women, but that is not true, men do just the same. They always find out this vulnerable spot in the analyst, and he can be sure that, whenever something gets into him, it will be exactly in that place where he is without defence. That is the place

where he is unconscious himself and where he is apt to make exactly the same projections as the patient. Then the condition of participation happens, or, more strictly speaking, a condition of personal contamination through mutual unconsciousness.

[324] One has, of course, all sorts of ideas about transference, and we are all somewhat prejudiced by the definition which Freud has given; one is inclined to think that it is always a matter of erotic transference. But my experience has not confirmed the theory that it is erotic contents or infantile things exclusively that are projected. According to my experience, anything can be a matter for projection, and the erotic transference is just one of the many possible forms of transference. There are many other contents in the human unconscious which are also of a highly emotional nature, and they can project themselves just as well as sexuality. All activated contents of the unconscious have the tendency to appear in projection. It is even the rule that an unconscious content which is constellated shows itself first as a projection. Any activated archetype can appear in projection, either into an external situation, or into people, or into circumstances—in short, into all sorts of objects. There are even transferences to animals and to things.

[325] Not very long ago I had an interesting case of an unusually intelligent man. I explained to him a projection he had “made”: he had projected his unconscious image of woman into a real woman, and the dreams showed very clearly just where the real person was utterly different from what he expected her to be. The fact went home. Then he said, “If I had known that two years ago it would have saved me 40,000 francs!” I asked, “How is that?” “Well, somebody showed me an old Egyptian sculpture, and I instantly fell in love with it. It was an Egyptian cat, a very beautiful thing.” He instantly bought it for 40,000 francs and put it on the mantelpiece in his drawing-room. But then he found that he had lost his peace of mind. His office was on the floor below, and nearly every hour he had to jump up from his work to look at the cat, and when he had satisfied his desire he went back to work only to go upstairs again after some time. This restlessness became so disagreeable that he put the cat on his desk right opposite him—to find that he couldn’t work any more! Then he had to lock it away in the attic in order to be liberated from its influence, and he had to fight down a continuous temptation to open the box and look at the cat again. When he understood his general projection of the feminine image—for, of course, the cat symbolized the woman—then the whole charm and fascination of the sculpture was gone.

[326] That was a projection into a physical object, and it made the cat into a living being to whom he always had to return as some people return to the analyst. As you know, the analyst is often accused of having snake’s eyes, of magnetizing or hypnotizing people, of forcing them to come back to him, of not letting them go.

There *are* certain exceptionally bad cases of countertransference when the analyst really cannot let go of the patient; but usually such accusations are the expression of a very disagreeable kind of projection which may even amount to ideas of persecution.

[327] The intensity of the transference relationship is always equivalent to the importance of its contents to the subject. If it is a particularly intense transference, we can be sure that the contents of the projection, once they are extracted and made conscious, will prove to be just as important to the patient as the transference was. When a transference collapses it does not vanish into the air; its intensity, or a corresponding amount of energy, will appear in another place, for instance in another relationship, or in some other important psychological form. For the intensity of the transference is an intense emotion which is really the property of the patient. If the transference is dissolved, all that projected energy falls back into the subject, and he is then in possession of the treasure which formerly, in the transference, had simply been wasted.

[328] Now we have to say a few words about the *aetiology* of the transference. Transference can be an entirely spontaneous and unprovoked reaction, a sort of “love at first sight.” Of course transference should never be misunderstood as love; it has nothing to do with love whatever. Transference only misuses love. It may appear as if transference were love, and inexperienced analysts make the mistake of taking it for love, and the patient makes the same mistake and says that he is in love with the analyst. But he is not in love at all.

[329] Occasionally a transference can even spring up before the first sight, that is before or outside the treatment. And if it happens to a person who does not come for analysis afterwards, we cannot find out the reasons. But this shows all the more that it has nothing whatever to do with the real personality of the analyst.

[330] Once a lady came to me whom I had seen about three weeks before at a social reception. I had not even spoken to her then, I had only talked to her husband, and I knew him only rather superficially. The lady then wrote for a consultation, and I gave her an appointment. She came, and when she was at the door of my consulting room she said, “I don’t want to enter.” I replied, “You don’t have to enter; you can go away, of course! I have absolutely no interest in having you here if you don’t want to come.” Then she said, “But I must!” I answered, “I’m not forcing you.” “But you forced me to come.” “How did I do that?” I thought she was crazy, but she was not crazy at all, she merely had a transference which pulled her to me. She had made some kind of projection in the meantime, and that projection had such a high emotional value for her that she could not resist it; she was magically drawn to come to me because that elastic string was too strong for her. In the course of her analysis we naturally found out what the contents of that non-provoked transference were.

[331] Usually a transference establishes itself only during the analysis. Very often it is caused by a difficulty in making contact, in establishing emotional harmony between the doctor and the patient—what the French psychologists at the time of hypnotic and suggestion therapy used to call “le rapport.” A good rapport means that the doctor and patient are getting on well together, that they can really talk to each other and that there is a certain amount of mutual confidence. Of course, at the time of the hypnotic therapists, the whole hypnotic and suggestive effect depended on the existence or non-existence of the rapport. In analytical treatment, if the rapport between analyst and patient is difficult on account of differences of personality, or if there are other psychological distances between them that hinder the therapeutic effect, that lack of contact causes the unconscious of the patient to try to cover the distance by building a compensatory bridge. Since there is no common ground, no possibility of forming any kind of relationship, a passionate feeling or an erotic fantasy attempts to fill the gap.

[332] This often happens to people who habitually resist other human beings—either because of an inferiority complex or because of megalomania, or for other reasons—and who are psychologically very isolated. Then, out of fear of getting lost, their nature causes a violent effort of the emotions to attach themselves to the analyst. They are in despair that perhaps he too will not understand them: so they try to propitiate either the circumstances, or the analyst, or their own unwillingness by a sort of sexual attraction.

[333] All these compensatory phenomena can be turned round and be applied to the analyst as well. Suppose, for instance, that an analyst has to treat a woman who does not particularly interest him, but suddenly he discovers that he has a sexual fantasy about her. Now I don't wish it on analysts that they should have such fantasies, but if they do they had better realize it, because it is important information from their unconscious that their human contact with the patient is not good, that there is a disturbance of rapport. Therefore the analyst's unconscious makes up for the lack of a decent human rapport by forcing a fantasy upon him in order to cover the distance and to build a bridge. These fantasies can be visual, they can be a certain feeling or a sensation—a sexual sensation, for instance. They are invariably a sign that the analyst's attitude to the patient is wrong, that he overvalues him or undervalues him or that he does not pay the right attention. That correction of his attitude can also be expressed by dreams. So if you dream of a patient, always pay attention and try to see whether the dream is showing you where you may be wrong. Patients are tremendously grateful when you are honest in that respect, and they feel it very much when you are dishonest or neglectful.

[334] I once had a most instructive case of that sort. I was treating a young girl of about twenty or twenty-four. She had had a very peculiar childhood; she was born in Java

of a very good European family, and had a native nurse.¹ As happens with children born in the colonies, the exotic environment and that strange and, in this case, even barbarous civilization got under her skin, and the whole emotional and instinctual life of the child became tainted with that peculiar atmosphere. That atmosphere is something the white man in the East hardly ever realizes; it is the psychic atmosphere of the native in regard to the white man, an atmosphere of intense fear—fear of the cruelty, the recklessness, and the tremendous and unaccountable power of the white man. That atmosphere infects children born in the East; the fear creeps into them and fills them with unconscious fantasies about the cruelty of the white man, and their psychology gets a peculiar twist and their sex life often goes completely wrong. They suffer from unaccountable nightmares and panics and cannot adapt themselves to normal circumstances when it comes to the problem of love and marriage and so on.

[335] That was the case with this girl. She went hopelessly astray and got into the most risky erotic situations, and she acquired a very bad reputation. She adopted inferior ways; she began to paint and powder herself in a rather conspicuous fashion, also to wear big ornaments in order to satisfy the primitive woman in her blood, or rather in her skin, so that *she* could join in and help her to live. Because she could not and naturally would not live without her instincts, she had to do all sorts of things which went too low. For instance, she easily succumbed to bad taste; she wore terrible colours to please the primitive unconscious in her so that it would join in when she wanted to interest a man. But naturally her choice of men was also below the mark, and so she got into a frightful tangle. Her nickname was “the great whore of Babylon.” All this was, of course, most unfortunate for an otherwise decent girl. When she came to me she really looked absolutely forbidding, so that I felt pretty awkward on account of my own maids when she was in my office for an hour. I said, “Now, you simply can’t look like that, you look like—” and I said something exceedingly drastic. She was very sad over it but she couldn’t help it.

[336] At this point I dreamed of her in the following way: *I was on a highway at the foot of a high hill, and upon the hill was a castle, and on that castle was a high tower, the donjon. On top of that high tower was a loggia, a beautiful open contrivance with pillars and a beautiful marble balustrade, and upon that balustrade sat an elegant figure of a woman. I looked up—and I had to look up so that I felt the pain in my neck even afterwards—and the figure was my patient!* Then I woke up and instantly I thought, “Heavens! Why does my unconscious put that girl so high up?” And immediately the thought struck me, “I have looked down on her.” For I really thought that she was bad. My dream showed me that this was a mistake, and I knew that I had been a bad doctor. So I told her the next day: “I have had a dream about you where I had to look up to you so that my neck hurt me, and the reason for this compensation is that I have looked down on you.” That worked miracles, I can tell you! No trouble

with the transference any more, because I simply got right with her and met her on the right level.

[337] I could tell you quite a number of informative dreams like that about the doctor's own attitude. And when you really try to be on a level with the patient, not too high nor too low, when you have the right attitude, the right appreciation, then you have much less trouble with the transference. It won't save you from it entirely, but sure enough you won't have those bad forms of transference which are mere over-compensations for a lack of rapport.

[338] There is another reason for over-compensation by transference in the case of patients with an utterly auto-erotic attitude; patients who are shut away in auto-erotic insulation and have a thick coat of armour, or a thick wall and moat around them. Yet they have a desperate need for human contact, and they naturally begin to crave for a human being outside the walls. But they don't do anything about it. They won't lift a finger, and neither will they allow anybody to approach them, and from this attitude they get a terrible transference. Such transferences cannot be touched, because the patients are too well defended on all sides. On the contrary, if you try to do something about the transference, they feel it as a sort of aggression, and they defend themselves still more. So you must leave these people to roast in their own fat until they are satisfied and come voluntarily out of their fortress. Of course they will complain like anything about your lack of understanding and so on, but the only thing you can do is to be patient and say, "Well, you are inside, you show nothing, and as long as you don't show anything I can do nothing either."

[339] In such a case the transference can come almost to the boiling point, because only a strong flame will cause the person to leave his castle. Of course that means a great outburst; but the outburst must be borne quietly by the doctor, and the patient will later on be very thankful that he has not been taken literally. I remember the case of a colleague of mine—and I can safely tell you of this case because she is dead—an American woman who came to me under very complicated circumstances. In the beginning she was on her high horse. You know there are peculiar institutions in America called universities and colleges for women; in our technical language we call them animus incubators, and they turn out annually a large number of fearful persons. Now she was such a bird. She was "very competent," she had got into a disagreeable transference situation. She was an analyst and had a case of a married man who fell wildly in love with her, apparently. It was not, of course, love, it was transference. He projected into her that she wanted to marry him but would not admit that she was in love with him and so wasted no end of flowers and chocolates and finery over her, and finally he even threatened her with a revolver. So she had to leave at once and come to me.

[340] It soon turned out that she had no idea of a woman's feeling-life. She was O.K. as a doctor, but whatever touched the sphere of a man was absolutely and utterly strange to her. She was even blissfully ignorant of a man's anatomy, because at the university, where she had studied one only dissected female bodies. So you can imagine the situation with which I was confronted.

[341] Naturally I saw it coming, and I saw right away why the man had fallen into the trap. She was totally unconscious of herself as a woman; she was just a man's mind with wings underneath, and the whole woman's body was non-existent, and her patient was forced by nature to fill the gap. He had to prove to her that a man does exist and that a man has a claim, that she was a woman and that she should respond to him. It was her female non-existence that baited the trap. He was, of course, equally unconscious, because he did not see at all that she did not exist as a woman. You see, he also was such a bird, consisting of only a head with wings underneath. He also was not a man. We often discover with Americans that they are tremendously unconscious of themselves. Sometimes they suddenly grow aware of themselves, and then you get these interesting stories of decent young girls eloping with Chinamen or with Negroes, because in the American that primitive layer, which with us is a bit difficult, with them is decidedly disagreeable, as it is much lower down. It is the same phenomenon as "going black" or "going native" in Africa.

[342] Now these two people both came into this awful transference situation, and one could say they were both entirely crazy, and therefore the woman had to run away. The treatment was, of course, perfectly clear. One had to make her conscious of herself as a woman, and a woman never becomes conscious of herself as long as she cannot accept the fact of her feelings. Therefore her unconscious arranged a marvellous transference to me, which naturally she would not accept, and I did not force it upon her. She was just such a case of complete insulation, and facing her with her transference would merely have forced her into a position of defence which of course would have defeated the whole purpose of the treatment. So I never spoke of it and just let things go, and quietly worked along with the dreams. The dreams, as they always do, were steadily informing us of the progress of her transference. I saw the climax coming and knew that one day a sudden explosion would take place. Of course, it would be a bit disagreeable and of a very emotional nature, as you have perhaps noticed in your own experience, and I foresaw a highly sentimental situation. Well, you just have to put up with it; you cannot help it. After six months of very quiet and painstaking systematic work she couldn't hold herself in any longer, and suddenly she almost shouted: "But I love you!" and then she broke down and fell upon her knees and made an awful mess of herself.

[343] You just have to stand such a moment. It is really awful to be thirty-four years old and to discover suddenly that you are human. Then it comes, of course, as a big lump

to you and that lump is often indigestible. If I had told her six months before that the moment would come when she would make declarations of love, she would have jumped off to the moon. Hers was a condition of auto-erotic insulation, and the rising flame, the increasing fire of her emotions finally burned through the walls, and naturally it all came out as a sort of organic eruption. She was the better for its happening, and in that moment even the transference situation in America was settled.

[344] You probably think that all this sounds pretty cold-blooded. As a matter of fact, you can only cope decently with such a situation when you do not behave as if you were superior. You have to accompany the process and lower your consciousness and feel along the situation, in order not to differ too much from your patient; otherwise he feels too awkward and will have the most terrible resentment afterwards. So it is quite good to have a reserve of sentiments which you can allow to play on such an occasion. Of course it requires some experience and routine to strike the right note. It is not always quite easy, but one has to bridge over these painful moments so that the reactions of the patient will not be too bad.

[345] I have already mentioned a further reason for the transference, and that is mutual unconsciousness and contamination.² The case which I just told you about provides an example of this. Contamination through mutual unconsciousness happens as a rule when the analyst has a similar lack of adaptation to that of the patient; in other words, when he is neurotic. In so far as the analyst is neurotic, whether his neurosis be good or bad, he has an open wound, somewhere there is an open door which he does not control, and there a patient will get in, and then the analyst will be contaminated. Therefore it is an important postulate that the analyst should know as much as possible about himself.

[346] I remember the case of a young girl who had been with two analysts before she came to me, and when she came to me she had the identical dream she had had when she was with those analysts.³ Each time at the very beginning of her analysis she had a particular dream: *She came to the frontier and she wanted to cross it, but she could not find the custom-house where she should have gone to declare whatever she carried with her.* In the first dream she was seeking the frontier, but she did not even come to it. That dream gave her the feeling that she would never be able to find the proper relation to her analyst; but because she had feelings of inferiority and did not trust her judgment, she remained with him, and nothing came of it at all. She worked with him for two months and then she left.

[347] She then went to another analyst. Again she dreamed that *she came to the frontier; it was a black night, and the only thing she could see was a faint little light. Somebody said that that was the light in the custom-house, and she tried to get to it. On the way she went down a hill and crossed a valley. In the depths of the valley was*

a dark wood and she was afraid to go on, but nevertheless she went through it, and suddenly she felt that somebody was clinging to her in the darkness. She tried to shake herself free, but that somebody clung to her still more, and she suddenly discovered that it was her analyst. Now what happened was that after about three months of work this analyst developed a violent counter-transference to her, which the initial dream had foreseen.

[348] When she came to me—she had seen me before at a lecture and had made up her mind to work with me—she dreamed that *she was coming to the Swiss frontier. It was day and she saw the custom-house. She crossed the frontier and she went into the custom-house, and there stood a Swiss customs official. A woman went in front of her and he let that woman pass, and then her turn came. She had only a small bag with her, and she thought she would pass unnoticed. But the official looked at her and said: “What have you got in your bag?” She said: “Oh, nothing at all,” and opened it. He put his hand in and pulled out something that grew bigger and bigger, until it was two complete beds.* Her problem was that she had a resistance against marriage; she was engaged and would not marry for certain reasons, and those beds were the marriage-beds. I pulled that complex out of her and made her realize the problem, and soon after she married.

[349] These initial dreams are often most instructive. Therefore I always ask a new patient when he first comes to me: “Did you know some time ago that you were coming? Have you met me before? Have you had a dream lately, perhaps last night?”—because if he did, it gives me most valuable information about his attitude. And when you keep in close touch with the unconscious you can turn many a difficult corner. A transference is always a hindrance; it is never an advantage. You cure in spite of the transference, not because of it.

[350] Another reason for the transference, particularly for bad forms of it, is provocation on the part of the analyst. There are certain analysts, I am sorry to say, who work for a transference because they believe, I don’t know why, that transference is a useful and even necessary part of the treatment; therefore patients *ought* to have a transference. Of course this is an entirely mistaken idea. I have often had cases who came to me after a previous analysis and who after a fortnight or so became almost desperate. So far things had gone on very nicely and I was fully confident that the case would work out beautifully—and suddenly the patients informed me that they could not go on, and then the tears came. I asked, “Why can’t you go on? Have you got no money, or what is the matter?” They said, “Oh, no, that is not the reason. I have no transference.” I said, “Thank heaven you have no transference! A transference is an illness. It is abnormal to have a transference. Normal people never have transferences.” Then the analysis goes on again quietly and nicely.

[351] We do not need transference just as we do not need projection. Of course, people will have it nevertheless. They always have projections but not the kind they expect. They have read Freud on transference, or they have been with another analyst, and it has been pumped into them that they ought to have a transference or they will never be cured. This is perfect nonsense. Transference or no transference, that has nothing to do with the cure. It is simply due to a peculiar psychological condition that there are these projections, and, just as one dissolves other projections by making them conscious, one has to dissolve the transference by making it conscious too. If there is no transference, so much the better. You get the material just the same. It is not transference that enables the patient to bring out his material; you get all the material you could wish for from dreams. The dreams bring out everything that is necessary. If you work for a transference, most likely you will provoke one, and the result of the analysis will be bad; for you can only provoke a transference by insinuating the wrong things, by arousing expectations, by making promises in a veiled way, which you do not mean to keep because you could not. You cannot possibly have affairs with eleven thousand virgins, and so you cheat people. An analyst is not allowed to be too friendly, otherwise he will be caught by it: he will produce an effect which goes beyond him. He cannot pay the bill when it is presented, and he should not provoke something for which he is not willing to pay. Even if the analyst means to do it for the good of the patient, it is a very misguided way, and it is always a great mistake. Leave people where they are. It does not matter whether they love the analyst or not. We are not all Germans who want to be loved when they sell you a pair of sock-suspenders. It is too sentimental. The patient's main problem is precisely to learn how to live his own life, and you don't help him when you meddle with it.

[352] Those are some of the reasons for a transference. The general psychological reason for projection is always an activated unconscious that seeks expression. The intensity of the transference is equivalent to the importance of the projected content. A strong transference of a violent nature corresponds to a fiery content; it contains something important, something of great value to the patient. But as long as it is projected, the analyst seems to embody this most precious and important thing. He can't help being in this unfortunate position, but he has to give that value back to the patient, and the analysis is not finished until the patient has integrated the treasure. So, if a patient projects the saviour complex into you, for instance, you have to give back to him nothing less than a saviour—whatever that means. But *you* are not the saviour—most certainly not.

[353] Projections of an archetypal nature involve a particular difficulty for the analyst. Each profession carries its respective difficulties, and the danger of analysis is that of becoming infected by transference projections, in particular by archetypal contents. When the patient assumes that his analyst is the fulfilment of his dreams, that he is

not an ordinary doctor but a spiritual hero and a sort of saviour, of course the analyst will say, "What nonsense! This is just morbid. It is a hysterical exaggeration." Yet—it tickles him; it is just too nice. And, moreover, he has the same archetypes in himself. So he begins to feel, "If there are saviours, well, perhaps it is just possible that I am one," and he will fall for it, at first hesitantly, and then it will become more and more plain to him that he really is a sort of extraordinary individual. Slowly he becomes fascinated and exclusive. He is terribly touchy, susceptible, and perhaps makes himself a nuisance in medical societies. He cannot talk with his colleagues any more because he is—I don't know what. He becomes very disagreeable or withdraws from human contacts, isolates himself, and then it becomes more and more clear to him that he is a very important chap really and of great spiritual significance, probably an equal of the Mahatmas on the Himalayas, and it is quite likely that he also belongs to the great brotherhood. And then he is lost to the profession.

[354] We have very unfortunate examples of this kind. I know quite a number of colleagues who have gone that way. They could not resist the continuous onslaught of the patients' collective unconscious—case after case projecting the saviour complex and religious expectations and the hope that perhaps this analyst with his "secret knowledge" might own the key that has been lost by the Church, and thus could reveal the redeeming truth. All this is a subtle and very alluring temptation and they have given way to it. They identify with the archetype, they discover a creed of their own, and as they need disciples who believe in them they will found a sect.

[355] The same problem also accounts for the peculiar difficulty psychologists of different schools have in discussing their divergent ideas in a reasonably amicable way, and for a tendency, peculiar to our branch of science, to lock themselves into little groups and scientific sects with a faith of their own. All these groups really doubt their exclusive truth, and therefore they all sit together and say the same thing continually until they finally believe it. Fanaticism is always a sign of repressed doubt. You can study that in the history of the Church. Always in those times when the Church begins to waver the style becomes fanatical, or fanatical sects spring up, because the secret doubt has to be quenched. When one is really convinced, one is perfectly calm and can discuss one's belief as a personal point of view without any particular resentment.

[356] It is a typical occupational hazard of the psychotherapist to become psychically infected and poisoned by the projections to which he is exposed. He has to be continually on his guard against inflation. But the poison does not only affect him psychologically; it may even disturb his sympathetic system. I have observed quite a number of the most extraordinary cases of physical illness among psychotherapists, illness which does not fit in with the known medical symptomatology, and which I ascribe to the effect of this continuous onslaught of projections from which the

analyst does not discriminate his own psychology. The peculiar emotional condition of the patient does have a contagious effect. One could almost say it arouses similar vibrations in the nervous system of the analyst, and therefore, like alienists, psychotherapists are apt to become a little queer. One should bear that problem in mind. It very definitely belongs to the problem of transference.

[357] We now have to speak of the *therapy* of the transference.⁴ This is an enormously difficult and complicated subject, and I am afraid I shall tell you certain things which you know just as well as I do, but in order to be systematic I cannot omit them.

[358] It is obvious that the transference has to be dissolved and dealt with in the same way as the analyst would deal with any other projection. That means in practical terms: you have to make the patient realize the *subjective value* of the personal and impersonal contents of his transference. For it is not only personal material which he projects. As you have just heard, the contents can just as well be of an impersonal, that is archetypal, nature. The saviour complex is certainly not a personal motif; it is a world-wide expectation, an idea which you find all over the world and in every epoch of history. It is the archetypal ideas of the magic personality.⁵

[359] In the beginning of an analysis, transference projections are inevitable repetitions of former personal experiences of the patient's. At this stage you have to treat all the relationships which the patient has had before. For instance, if you have a case who has been in many health-resorts with the typical doctors you find in such places, the patient will project these experiences into the analyst; so you have first to work through the figures of all those colleagues in seaside places and sanatoria, with enormous fees and the necessary theatrical display, and the patient quite naturally assumes that you too are such a bird. You have to work through the whole series of people that the patient has experienced—the doctors, the lawyers, the teachers in schools, the uncles, the cousins, the brothers, and the father. And when you have gone through the whole procession and come right down to the nursery you think that now you are through with it, but you are not. It is just as if behind the father there was still more, and you even begin to suspect that the grandfather is being projected. That is possible; I never knew of a great-grandfather that was projected into me, but I know of a grandfather that was. When you have got down to the nursery, so that you almost peep out of the other side of existence, then you have exhausted the possibilities of *consciousness*; and if the transference does not come to an end there, despite all your efforts, it is on account of the projection of *impersonal* contents. You recognize the existence of impersonal projections by the peculiar impersonal nature of their contents; as for instance the saviour complex or an archaic God-image. The archetypal character of these images produces a "magic," that is, an overpowering effect. With our rational consciousness we can't see why this should happen. God, for instance, is spirit, and spirit to us is nothing substantial or dynamic. But if you study

the original meaning of these terms, you get at the real nature of the underlying experience, and you understand how they affect the primitive mind, and, in a similar way, the primitive psyche in ourselves. Spirit, *spiritus*, or *pneuma* really means air, wind, breath; *spiritus* and *pneuma* in their archetypal character are dynamic and half-substantial agencies: you are moved by them as by a wind, they are breathed into you, and then you are inflated.

[360] The projected archetypal figures can just as well be of negative character, like images of the sorcerer, the devil, of demons and so on. Even analysts are not at all quite fireproof in that respect. I know colleagues who produce the most marvellous fantasies about myself and believe that I am in league with the devil and work black magic. And with people who never before thought that there was such a thing as the devil, the most incredible figures appear in the transference of impersonal contents. The projection of images of parental influence can be dissolved with the ordinary means of normal reasoning and common sense; but you cannot destroy the hold of impersonal images by mere reason. It would not even be right to destroy them, because they are tremendously important. In order to explain this, I am afraid I shall have to refer again to the history of the human mind.

[361] It is no new discovery that archetypal images are projected. They actually have to be projected, otherwise they inundate consciousness. The problem is merely to have a form which is an adequate container. There is, as a matter of fact, an age-old institution which helps people to project impersonal images. You know it very well: you all probably have gone through the procedure, but unfortunately you were too young to recognize its importance. This institution is religious initiation, and with us it is baptism. When the fascinating and unique influence of the parental images has to be loosened, so that the child is liberated from his original biological participation with the parents, then Nature, that is the unconscious nature in man, in her infinite wisdom produces a certain kind of initiation. You find it with very primitive tribes—it is the initiation into manhood, into participation in the spiritual and social life of the tribe. In the course of the differentiation of consciousness, initiation has undergone many changes of form, until with us it was elaborated into the Christian institution of baptism. In baptism, there are two necessary functionaries, godfather and godmother. In our Swiss dialect we call them by the names of God, “Götti” and “Gotte.” “Götti” is the masculine form, it means the begetter; “Gotte” is the feminine form. The word “God” has nothing to do with “good”; it really means the Begetter. Baptism and the spiritual parents in the form of godfather and godmother express the mysterium of being twice-born. You know that all the higher castes in India have the honorific title of “Twice-born.” It was also the prerogative of the Pharaoh to be twice-born. Therefore very often you find in Egyptian temples beside the main room the so-called birth-chamber where one or two rooms were reserved for the rite. In

them the Pharaoh's twofold birth is described, how he is born in the flesh as a human being from ordinary parents, but is also generated by the god and carried and given birth to by the goddess. He is born the son of man and of God.

[362] Our baptism means the detaching of the child from the merely natural parents and from the overpowering influence of the parental images. For this purpose, the biological parents are replaced by spiritual parents; godfather and godmother represent the *intercessio divina* through the medium of the Church, which is the visible form of the spiritual kingdom. In the Catholic rite even marriage—where we would suppose it to be all-important that this particular man and this particular woman become united and are confronted with each other—is interfered with by the Church; the *intercessio sacerdotis* prevents the immediate contact of the couple. The priest represents the Church, and the Church is always in between in the form of confession, which is obligatory. This intervention is not due to the particular cunning of the Church; it is rather her great wisdom, and it is an idea going back to the very origins of Christianity that we are not married merely as man and woman; we are married *in Christo*. I own an antique vase upon which an early Christian marriage is represented. The man and the woman hold each other's hand in the Fish; the Fish is between them, and the Fish is Christ. In this way the couple is united in the Fish. They are separated and united by Christ; Christ is in between, he is the representative of the power which is meant to separate man from merely natural forces.

[363] This process of separation from nature is undergone in the well-known initiation rites or puberty rites of primitive tribes. When they approach puberty, the boys are called away suddenly. In the night they hear the voice of the spirits, the bull-roarers, and no woman is allowed to appear out of the house, or she is killed instantly. Then the boys are brought out to the bush-house, where they are put through all sorts of gruesome performances. They are not allowed to speak; they are told that they are dead, and then they are told that they are now reborn. They are given new names in order to prove that they are no more the same personalities as before, and so they are no longer the children of their parents. The initiation can even go so far that, after they return, the mothers are not allowed to talk to their sons any more, because the young men are no longer their children. Formerly, with the Hottentots, the boy had occasionally even to perform incest once with his mother in order to prove that she was not his mother any more, but just a woman like the rest.

[364] Our corresponding Christian rite has lost much of its importance, but if you study the symbolism of baptism you still see traces of the original meaning. Our birth-chamber is the baptismal font; this is really the piscina, the fish-pond in which one is like a little fish; one is symbolically drowned and then revived. You know that the early Christians were actually plunged into the baptismal font, and this used to be much larger than it is now; in many old churches the baptistry was a building on its

own, and it was always built on the ground-plan of a circle. On the day before Easter, the Catholic Church has a special ceremony for the consecration of the baptismal font, the *Benedictio Fontis*. The merely natural water is exorcised from the admixture of all malign powers and transformed into the regenerating and purifying fountain of life, the immaculate womb of the divine source. Then the priest divides the water in the fourfold form of the cross, breathes upon it three times, plunges the consecrated Easter candle three times into it, as a symbol of the eternal light, and at the same time his incantation brings the virtue, the power of the *Spiritus Sanctus* to descend into the font. From this *hierosgamos*, from the holy marriage between the *Spiritus Sanctus* and the baptismal water as the womb of the Church, man is reborn in the true innocence of new childhood. The maculation of sin is taken from him and his nature is joined with the image of God. He is no longer contaminated by merely natural forces, he is regenerated as a spiritual being.

[365] We know of other institutions for detaching man from natural conditions. I can't go into much detail, but if you study the psychology of primitives, you find that all important events of life are connected with elaborate ceremonies whose purpose is to detach man from the preceding stage of existence and to help him to transfer his psychic energy into the next phase. When a girl marries, she ought to be detached from the parental images and should not become attached to a projection of the father-image into the husband. Therefore in Babylon a peculiar ritual was observed whose purpose was to detach the young girl from the father-image. This is the rite of temple prostitution, in which girls of good families had to hand themselves over to a stranger visiting the temple, who presumably would never return, and had to spend a night with him. We know of a similar institution in the Middle Ages, the *jus primae noctis*, the right of the first night which the feudal lord had in regard to his serfs. The bride had to spend her wedding-night with her feudal lord. By the rite of temple prostitution, a most impressive image was created which collided with the image of the man the young woman was going to marry, and so when there was trouble in marriage—for even in those days trouble occasionally arose—the regression which is the natural result would not go back to the father-image but to the stranger she had once met, the lover who came from unknown lands. Then she did not fall back into childhood but upon a human being suited to her age, and so was sufficiently protected against infantile regression.

[366] This ritual shows a very beautiful observation of the human psyche. For there is an archetypal image in women of a lover in a remote, unknown land, a man coming over the seas who meets her once and then goes away again. You know this motif from Wagner's *Flying Dutchman* and from Ibsen's *Lady from the Sea*. In both dramas the heroine is waiting for the stranger who will come from far over the seas to have the great love experience with her. In Wagner's opera she has fallen in love with the

actual image of him and knows him even before he arrives. The Lady from the Sea has met him once before and is under the compulsion of always going to the sea to await his return. In that Babylonian rite this archetypal image is lived concretely in order to detach the woman from the parental images which are real archetypal images and therefore exceedingly powerful. I have written a little book about the relations between the ego and the unconscious,⁶ where I have described a case of projection of the father-image by a woman who was under my treatment, and how the problem then developed through the analysis of the archetypal image which was at the basis of this father transference.

[367] The first stage of the treatment of the transference does not involve only the realization by the patient that he is still looking at the world from the angle of the nursery, school-room, and so on, by projecting and expecting all the positive and negative authoritative figures of his personal experience; this realization merely deals with the objective side. To establish a really mature attitude, he has to see the *subjective value* of all these images which seem to create trouble for him. He has to assimilate them into his own psychology; he has to find out in what way they are part of himself; how he attributes for instance a positive value to an *object*, when as a matter of fact it is he who could and should develop this value. And in the same way, when he projects negative qualities and therefore hates and loathes the object, he has to discover that he is projecting his own inferior side, his shadow, as it were, because he prefers to have an optimistic and one-sided image of himself. Freud, as you know, deals only with the objective side. But you cannot really help a patient to assimilate the contents of his neurosis by indulgence in a childish lack of responsibility, or by resignation to a blind fate of which he is the victim. His neurosis means him to become a total personality, and that includes recognition of and responsibility for his whole being, his good and his bad sides, his superior as well as his inferior functions.

[368] Let us now assume that the projection of personal images has been worked through and is sufficiently dealt with, but there is still a transference which you simply cannot dissolve. Then we come to the *second stage* in the therapy of transference. That is the *discrimination between personal and impersonal contents*. The personal projections, as we have seen, must be dissolved; and they can be dissolved through conscious realization. But the impersonal projections cannot be destroyed because they belong to the structural elements of the psyche. They are not relics of a past which has to be outgrown; they are, on the contrary, purposive and compensatory functions of the utmost importance. They are an important protection against situations in which a man might lose his head. In any situation of panic, whether external or internal, the archetypes intervene and allow a man to react in an instinctively adapted way, just as if he had always known the situation: he reacts in

the way mankind has always reacted. Therefore the mechanism is of vital importance.

[369] It goes without saying that the projection of these impersonal images upon the analyst has to be withdrawn. But you merely dissolve the *act* of projection; you should not, and really cannot, dissolve its *contents*. Neither, of course, can the patient assimilate the impersonal contents into his personal psychology. The fact that they are *impersonal* contents is just the reason for projecting them; one feels that they do not belong to one's subjective mind, they must be located somewhere outside one's ego, and, for lack of a suitable form, a human object is made their receptacle. So you have to be exceedingly careful in handling impersonal projections. It would, for instance, be a great mistake to say to a patient: "You see, you simply project the saviour-image into me. What nonsense to expect a saviour and to make me responsible." If you meet such an expectation, take it seriously; it is by no means nonsense. The whole world has a saviour expectation; you find it everywhere. Look at Italy, for instance, or look at Germany. At present you have no saviour in England, and in Switzerland we have none; but I don't believe that we are so very different from the rest of Europe. The situation with us is slightly different from that of the Italians and Germans; they are perhaps a little bit less balanced; but even with us it would need precious little. In those countries you have the saviour complex as mass psychology. The saviour complex is an archetypal image of the collective unconscious, and it quite naturally becomes activated in an epoch so full of trouble and disorientation as ours. In these collective events, we merely see, as through a magnifying glass, what can also happen within the individual. It is in just such a moment of panic that the compensatory psychic elements come into action. It is not at all an abnormal phenomenon. It is perhaps strange to us that it should be expressed in political form. But the collective unconscious is a very irrational factor, and our rational consciousness cannot dictate to it how it should make its appearance. Of course, if left entirely to itself, its activation can be very destructive; it can, for instance, be a psychosis. Therefore, man's relation to the collective unconscious has always been regulated; there is a characteristic form by which the archetypal images are expressed. For the collective unconscious is a function that always operates, and man has to keep in touch with it. His psychic and spiritual health is dependent on the co-operation of the impersonal images. Therefore man has always had his religions.

[370] What are religions? Religions are psychotherapeutic systems. What are we doing, we psychotherapists? We are trying to heal the suffering of the human mind, of the human psyche or the human soul, and religions deal with the same problem. Therefore our Lord himself is a healer; he is a doctor; he heals the sick and he deals with the troubles of the soul; and that is exactly what we call psychotherapy. It is not a play on words when I call religion a psychotherapeutic system. It is the most

elaborate system, and there is a great practical truth behind it. I have a clientele which is pretty large and extends over a number of continents, and where I live we are practically surrounded by Catholics; but during the last thirty years I have not had more than about six practising Catholics among my patients. The vast majority were Protestants and Jews. I once sent round a questionnaire to people whom I did not know, asking: "If you were in psychological trouble what would you do? Would you go to the doctor or would you go to the priest or parson?" I cannot remember the actual figures; but I remember that about twenty per cent of the Protestants said they would go to the parson. All the rest were most emphatically against the parson and for the doctor, and the most emphatic were the relatives and children of parsons. There was one Chinese who replied, and he put it very nicely. He remarked: "When I am young I go to the doctor, and when I am old I go to the philosopher." But about fifty-eight or sixty per cent of the Catholics answered that they would certainly go to the priest. That proves that the Catholic Church in particular, with its rigorous system of confession and its director of conscience, is a therapeutic institution. I have had some patients who, after having had analysis with me, even joined the Catholic Church, just as I have had some patients who now go to the so-called Oxford Group Movement—with my blessing! I think it is perfectly correct to make use of these psychotherapeutic institutions which history has given to us, and I wish I were still a medieval man who could join such a creed. Unfortunately it needs a somewhat medieval psychology to do it, and I am not sufficiently medieval. But you see from this that I take the archetypal images and a suitable form for their projection seriously, because the collective unconscious is really a serious factor in the human psyche.

[371] All those personal things like incestuous tendencies and other childish tunes are mere surface; what the unconscious really contains are the great collective events of the time. In the collective unconscious of the individual, history prepares itself; and when the archetypes are activated in a number of individuals and come to the surface, we are in the midst of history, as we are at present. The archetypal image which the moment requires gets into life, and everybody is seized by it. That is what we see today. I saw it coming, I said in 1918 that the "blond beast" is stirring in its sleep and that something will happen in Germany.⁷ No psychologist then understood at all what I meant, because people had simply no idea that our personal psychology is just a thin skin, a ripple upon the ocean of collective psychology. The powerful factor, the factor which changes our whole life, which changes the surface of our known world, which makes history, is collective psychology, and collective psychology moves according to laws entirely different from those of our consciousness. The archetypes are the great decisive forces, they bring about the real events, and not our personal reasoning and practical intellect. Before the Great War all intelligent people said:

“We shall not have any more war, we are far too reasonable to let it happen, and our commerce and finance are so interlaced internationally that war is absolutely out of the question.” And then we produced the most gorgeous war ever seen. And now they begin to talk that foolish kind of talk about reason and peace plans and such things; they blindfold themselves by clinging to a childish optimism—and now look at reality! Sure enough, the archetypal images decide the fate of man. Man’s unconscious psychology decides, and not what we think and talk in the brain-chamber up in the attic.

[372] Who would have thought in 1900 that it would be possible thirty years later for such things to happen in Germany as are happening today? Would you have believed that a whole nation of highly intelligent and cultivated people could be seized by the fascinating power of an archetype? I saw it coming, and I can understand it because I know the power of the collective unconscious. But on the surface it looks simply incredible. Even my personal friends are under that fascination, and when I am in Germany, I believe it myself, I understand it all, I know it has to be as it is. One cannot resist it. It gets you below the belt and not in your mind, your brain just counts for nothing, your sympathetic system is gripped. It is a power that fascinates people from within, it is the collective unconscious which is activated, it is an archetype which is common to them all that has come to life. And because it is an archetype, it has historical aspects and we cannot understand the events without knowing history.⁸ It is German history that is being lived today, just as Fascism is living Italian history. We cannot be children about it, having intellectual and reasonable ideas and saying: this should not be. That is just childish. This is real history, this is what really happens to man and has always happened, and it is far more important than our personal little woes and our personal convictions. I know highly educated Germans who were just as reasonable as I think I am or as you think you are. But a wave went over them and just washed their reason away, and when you talk to them you have to admit that they could not do anything about it. An incomprehensible fate has seized them, and you cannot say it is right, or it is wrong. It has nothing to do with rational judgment, it is just history. And when your patient’s transference touches upon the archetypes, you touch upon a mine that may explode, just as we see it explode collectively. These impersonal images contain enormous dynamic power. Bernard Shaw says in *Man and Superman*: “This creature Man, who in his own selfish affairs is a coward to the backbone, will fight for an idea like a hero.”⁹ Of course, we would not call Fascism or Hitlerism ideas. They are archetypes, and so we would say: Give an archetype to the people and the whole crowd moves like one man, there is no resisting it.

[373] On account of this tremendous dynamic power of archetypal images you cannot reason them away. Therefore the only thing to do at the *third stage* of the therapy of

the transference is *to differentiate the personal relationship to the analyst from impersonal factors*. It is perfectly understandable that when you have carefully and honestly worked for a patient, he likes you, and because you have done a decent bit of work on a patient, you like him, whether it is a man or a woman. That is quite self-evident. It would be most unnatural and neurotic if there were not some personal recognition on the patient's part for what you have done for him. A personal human reaction to you is normal and reasonable, therefore let it be, it deserves to live; it is not transference any more. But such an attitude to the analyst is possible in a human and decent form only when it is not vitiated by unrecognized impersonal values. This means that there has to be, on the other side, a full recognition of the importance of the archetypal images, many of which have a religious character. Whether you assume that the Nazi storm in Germany has a religious value or not does not matter. It has. Whether you think that the Duce is a religious figure or not does not matter, because he is a religious figure. You could even read the affirmation of it in a newspaper these days, when they quoted that verse about a Roman Caesar: "Ecce deus, deus ille, Menalca."¹⁰ Fascism is the Latin form of religion, and its religious character explains why the whole thing has such a tremendous fascination.

[374] The consequence of this recognition of the importance of impersonal values may be that your patient joins a Church or a religious creed or whatever it may be. If he cannot bring together his experience of the collective unconscious within a given religious form, then the difficulty begins. Then the impersonal factors have no receptacle, and so the patient falls back into the transference, and the archetypal images spoil the human relation to the analyst. Then the analyst *is* the saviour, or curse him, he is not when he ought to be! For he is only a human being; he cannot be the saviour nor any other archetypal image which is activated in the patient's unconscious.

[375] On account of that enormously difficult and important problem I have worked out a particular technique for restoring these projected impersonal values to the individual himself. It is a rather complicated technique, and last night I was just about to show you something of it in relation to that dream. For when the unconscious says that below the Christian Church is the secret chamber with the golden bowl and the golden dagger, it does not lie. The unconscious is nature, and nature never lies. There *is* gold, there *is* the treasure and the great value.

[376] If I had had the opportunity I would have gone on and told you something about that treasure and the means to secure it. And then you would have seen the justification for the method which enables the individual to keep in touch with his impersonal images. As it is. I can only allude to it and must refer you to my books for further material.¹¹

[377] I call this *fourth stage* of the therapy of transference the *objectivation of impersonal images*. It is an essential part of the process of individuation.¹² Its goal is to detach consciousness from the object so that the individual no longer places the guarantee of his happiness, or of his life even, in factors outside himself, whether they be persons, ideas, or circumstances, but comes to realize that everything depends on whether he holds the treasure or not. If the possession of that gold is realized, then the centre of gravity is in the individual and no longer in an object on which he depends. To reach such a condition of detachment is the aim of Eastern practices, and it is also the aim of all the teachings of the Church. In the various religions the treasure is projected into the sacred figures, but this hypostasis is no longer possible for the modern enlightened mind. A great number of individuals cannot express their impersonal values in historical symbols any more.

[378] They are therefore faced with the necessity of finding an individual method by which the impersonal images are given shape. For they have to take on form, they have to live their characteristic life, otherwise the individual is severed from the basic function of the psyche, and then he is neurotic, he is disorientated and in conflict with himself. But if he is able to objectify the impersonal images and relate to them, he is in touch with that vital psychological function which from the dawn of consciousness has been taken care of by religion.

[379] It is impossible for me to go into details of the problem, not only because the time for my lecture is over, but because it is beyond scientific conceptions to give adequate expression to a living psychic experience. All we can say rationally about this condition of detachment is to define it as a sort of centre within the psyche of the individual, but not within the ego. It is a non-ego centre. I am afraid I should have to give you a long dissertation on comparative religion in order to convey to you fully what I mean by a non-ego centre.¹³ So I can only mention the existence of this problem. It is really the essential problem of a great number of individuals who come to analysis, and therefore the psychotherapist has to try to find a method by which he can help them to solve it.

[380] If we adopt such a method, we take up the torch that was abandoned by our old colleagues of the seventeenth century when they put it down in order to become chemists. In so far as we psychologists are emerging from chemical and material conceptions of the psyche, we are taking up that torch again, century—for alchemy was the work of the doctors who were busy with the mind.

Discussion

Question:

[381] May I ask Professor Jung a very elementary question: Would he give us a definition of neurosis?

Professor Jung:

[382] A neurosis is a dissociation of personality due to the existence of complexes. To have complexes is in itself normal; but if the complexes are incompatible, that part of the personality which is too contrary to the conscious part becomes split off. If the split reaches the organic structure, the dissociation is a psychosis, a schizophrenic condition, as the term denotes. Each complex then lives an existence of its own, with no personality left to tie them together.

[383] As the split-off complexes are unconscious, they find only an indirect means of expression, that is, through neurotic symptoms. Instead of suffering from a psychological conflict, one suffers from a neurosis. Any incompatibility of character can cause dissociation, and too great a split between the thinking and the feeling function, for instance, is already a slight neurosis. When you are not quite at one with yourself in a given matter, you are approaching a neurotic condition. The idea of psychic dissociation is the most general and cautious way I can define a neurosis. Of course it does not cover the symptomatology and phenomenology of neurosis; it is only the most general psychological formulation I am able to give.

Dr. H. G. Baynes:

[384] You said that transference is of no practical value in analysis. Is it not possible to give it a teleological value?

Professor Jung:

[385] I have not said it in so many words, but the teleological value of transference becomes apparent from an analysis of its archetypal contents. Its purposive value is also shown in what I said about transference as a function of compensation for a lack of rapport between the analyst and the patient—at least if one assumes that it is normal for human beings to be *en rapport* with each other. Of course I could imagine that an introverted philosopher is rather inclined to think that people have no contacts. For instance, Schopenhauer says that human egotism is so great that a man can kill his brother in order to smear his boots with his brother's fat.

Dr. Henry V. Dicks:

[386] I think we can assume then, Professor Jung, that you regard the outbreak of a neurosis as an attempt at self-cure, as an attempt at compensation by bringing out the inferior function?

Professor Jung:

[387] Absolutely.

Dr. Dicks:

[388] I understand, then, that the outbreak of a neurotic illness, from the point of view of man's development, is something favourable?

Professor Jung:

[389] That is so, and I am glad you bring up that idea. That is really my point of view. I am not altogether pessimistic about neurosis. In many cases we have to say: "Thank heaven he could make up his mind to be neurotic." Neurosis is really an attempt at self-cure, just as any physical disease is part an attempt at selfcure. We cannot understand a disease as an *ens per se* any more, as something detached which not so long ago it was believed to be. Modern medicine—internal medicine, for instance—conceives of disease as a system composed of a harmful factor and a healing factor. It is exactly the same with neurosis. It is an attempt of the self-regulating psychic system to restore the balance, in no way different from the function of dreams—only rather more forceful and drastic.

Dr. J. A. Hadfield:

[390] Would Professor Jung give us a short account of the technique of active imagination?

Professor Jung:

[391] That was the subject I really wanted to tell you about today in consequence of the analysis of the Toledo dream, so I am very glad to take it up. You will realize that I shall not be able to present any empirical material, but I may succeed in giving you an idea of the method. I believe that the best way is to tell you of a case where it was very difficult to teach the patient the method.

[392] I was treating a young artist, and he had the greatest trouble in understanding what I meant by active imagination. He tried all sorts of things but he could not get at

it. The difficulty with him was that he could not think. Musicians, painters, artists of all kinds, often can't think at all, because they never intentionally use their brain. This man's brain too was always working for itself; it had its artistic imaginations and he couldn't use it psychologically, so he couldn't understand. I gave him every chance to try, and he tried all sorts of stunts. I cannot tell you all the things he did, but I will tell you how he finally succeeded in using his imagination psychologically.

[393] I live outside the town, and he had to take the train to get to my place. It starts from a small station, and on the wall of that station was a poster. Each time he waited for his train he looked at that poster. The poster was an advertisement for Mürren in the Bernese Alps, a colourful picture of the waterfalls, of a green meadow and a hill in the centre, and on that hill were several cows. So he sat there staring at that poster and thinking that he could not find out what I meant by active imagination. And then one day he thought: "Perhaps I could start by having a fantasy about that poster. I might for instance imagine that I am myself in the poster, that the scenery is real and that I could walk up the hill among the cows and then look down on the other side, and then I might see what there is behind that hill."

[394] So he went to the station for that purpose and imagined that he was in the poster. He saw the meadow and the road and walked up the hill among the cows, and then he came up to the top and looked down, and there was the meadow again, sloping down, and below was a hedge with a stile. So he walked down and over the stile, and there was a little footpath that ran round a ravine, and a rock, and when he came round that rock, there was a small chapel, with its door standing a little ajar. He thought he would like to enter, and so he pushed the door open and went in, and there upon an altar decorated with pretty flowers stood a wooden figure of the Mother of God. He looked up at her face, and in that exact moment something with pointed ears disappeared behind the altar. He thought, "Well, that's all nonsense," and instantly the whole fantasy was gone.

[395] He went away and said, "Now again I haven't understood what active imagination is." And then, suddenly, the thought struck him: "Well, perhaps that really *was* there: perhaps that thing behind the Mother of God, with the pointed ears, that disappeared like a flash, really happened." Therefore he said to himself: "I will just try it all over as a test." So he imagined that he was back in the station looking at the poster, and again he fantasied that he was walking up the hill. And when he came to the top of the hill, he wondered what he would see on the other side. And there was the hedge and the stile and the hill sloping down. He said. "Well, so far so good. Things haven't moved since, apparently." And he went round the rock, and there was the chapel. He said: "There is the chapel, that at least is no illusion. It is all quite in order." The door stood ajar and he was quite pleased. He hesitated a moment and said: "Now, when I push that door open and I see the Madonna on the altar, then that

thing with the pointed ears should jump down behind the Madonna, and if it doesn't, then the whole thing is bunk!" And so he pushed the door open and looked—and there it all was and the thing jumped down, as before, and then he was convinced. From then on he had the key and knew he could rely on his imagination, and so he learned to use it.

[396] There is no time to tell you about the development of his images, nor how other patients arrive at the method. For of course everybody gets at it in his own way. I can only mention that it might also be a dream or an impression of a hypnagogic nature from which active imagination can start. I really prefer the term "imagination" to "fantasy," because there is a difference between the two which the old doctors had in mind when they said that "opus nostrum," our work, ought to be done "per veram imaginationem et non phantastica"—by true imagination and not by a fantastical one.¹³ In other words, if you take the correct meaning of this definition, fantasy is mere nonsense, a phantasm, a fleeting impression; but imagination is active, purposeful creation. And this is exactly the distinction I make too.

[397] A fantasy is more or less your own invention, and remains on the surface of personal things and conscious expectations. But active imagination, as the term denotes, means that the images have a life of their own and that the symbolic events develop according to their own logic—that is, of course, if your conscious reason does not interfere. You begin by concentrating upon a starting point. I will give you an example from my own experience. When I was a little boy, I had a spinster aunt who lived in a nice old-fashioned house. It was full of beautiful old coloured engravings. Among them was a picture of my grandfather on my mother's side. He was a sort of bishop, and he was represented as coming out of his house and standing on a little terrace. There were handrails and stairs coming down from the terrace, and a footpath leading to the cathedral. He was in full regalia, standing there at the top of the terrace. Every Sunday morning I was allowed to pay a call on my aunt, and then I knelt on a chair and looked at that picture until grandfather came down the steps. And each time my aunt would say, "But, my dear, he doesn't walk, he is still standing there." But I knew I had seen him walking down.

[398] You see how it happened that the picture began to move. And in the same way, when you concentrate on a mental picture, it begins to stir, the image becomes enriched by details, it moves and develops. Each time, naturally, you mistrust it and have the idea that you have just made it up, that it is merely your own invention. But you have to overcome that doubt, because it is not true. We can really produce precious little by our conscious mind. All the time we are dependent upon the things that literally fall into our consciousness; therefore in German we call them *Einfälle*. For instance, if my unconscious should prefer not to give me ideas, I could not proceed with my lecture, because I could not invent the next step. You all know the

experience when you want to mention a name or a word which you know quite well, and it simply does not present itself; but some time later it drops into your memory. We depend entirely upon the benevolent co-operation of our unconscious. If it does not co-operate, we are completely lost. Therefore I am convinced that we cannot do much in the way of conscious invention; we over-estimate the power of intention and the will. And so when we concentrate on an inner picture and when we are careful not to interrupt the natural flow of events, our unconscious will produce a series of images which make a complete story.

[399] I have tried that method with many patients and for many years, and I possess a large collection of such "opera." It is most interesting to watch the process. Of course I don't use active imagination as a panacea; there have to be definite indications that the method is suitable for the individual, and there are a number of patients with whom it would be wrong to force it upon them. But often in the later stage of analysis, the objectivation of images replaces the dreams. The images anticipate the dreams, and so the dream-material begins to peter out. The unconscious becomes deflated in so far as the conscious mind relates to it. Then you get all the material in a creative form and this has great advantages over dream-material. It quickens the process of maturation, for analysis is a process of quickened maturation. This definition is not my own invention; the old professor Stanley Hall invented the term.

[400] Since by active imagination all the material is produced in a conscious state of mind, the material is far more rounded out than the dreams with their precarious language. And it contains much more than dreams do; for instance, the feeling-values are in it, and one can judge it by feeling. Quite often, the patients themselves feel that certain material contains a tendency to visibility. They say, for instance: "That dream was so impressive, if I only could paint I would try to express its atmosphere." Or they feel that a certain idea should be expressed not rationally but in symbols. Or they are gripped by an emotion which, if given form, would be explainable, and so on. And so they begin to draw, to paint, or to shape their images plastically, and women sometimes do weaving. I have even had one or two women who danced their unconscious figures. Of course, they can also be expressed in writing.

[401] I have many complete series of such pictures. They yield an enormous amount of archetypal material. Just now I am about to work out the historical parallels of some of them. I compare them with the pictorial material produced in similar attempts in past centuries, particularly in the early Middle Ages. Certain elements of the symbolism go back to Egypt. In the East we find many interesting parallels to our unconscious material, even down to the last details. This comparative work gives us a most valuable insight into the structure of the unconscious. You have to hand the necessary parallels to the patients too, not of course in such an elaborate way as you would present it in a scientific study, but as much as each individual needs in order to

understand his archetypal images. For he can see their real meaning only when they are not just a queer subjective experience with no external connections, but a typical, ever-recurring expression of the objective facts and processes of the human psyche. By objectifying his impersonal images, and understanding their inherent ideas, the patient is able to work out all the values of his archetypal material. Then he can really see it, and the unconscious becomes understandable to him. Moreover, this work has a definite effect upon him. Whatever he has put into it works back on him and produces a change of attitude which I tried to define by mentioning the non-ego centre.

[402] I will give you an interesting example. I had a case, a university man, a very one-sided intellectual. His unconscious had become troubled and activated; so it projected itself into other men who appeared to be his enemies, and he felt terribly lonely, because everybody seemed to be against him. Then he began to drink in order to forget his troubles, but he got exceedingly irritable and in these moods he began to quarrel with other men, and several times he had very disagreeable encounters, and once he was thrown out of a restaurant and got beaten up. And there were more incidents of that sort. Then things became really too thick for his endurance, and he came to me to ask my advice about what he should do. In that interview, I got a very definite impression of him: I saw that he was chock-full of archaic material, and I said to myself: "Now I am going to make an interesting experiment to get that material absolutely pure, without any influence from myself, and therefore I won't touch it." So I sent him to a woman doctor who was then just a beginner and who did not know much about archetypal material. Thus I was absolutely sure that she would not tamper with it. The patient was in such low spirits that he did not object to my proposition. So he worked with her and did everything she said.¹⁴

[403] She told him to watch his dreams, and he wrote them all down carefully, from the first to the last. I now have a series of about thirteen hundred dreams of his. They contain the most marvellous series of archetypal images. And quite naturally, without being told to do so, he began to draw a number of pictures which he saw in his dreams, because he felt them to be very important. And in this work on his dreams and on these pictures he did exactly the kind of work which other patients do by active imagination. He even invented active imagination for himself in order to work out certain most intricate problems which his dreams presented him with, as for instance how to balance the contents of a circle, and more things like this. He worked out the problem of the *perpetuum mobile*, not in a crazy way but in a symbolic way. He worked on all the problems which medieval philosophy was so keen on and of which our rational mind says. "That is all nonsense." Such a statement only shows that we do not understand. They did understand: we are the fools, not they.

[404] In the course of this analysis, which took him through about the first four hundred dreams, he was not under my surveillance. After the first interview I did not see him at all for eight months. He was five months with that doctor, and then for three months he was doing the work all by himself, continuing the observation of his unconscious with minute accuracy. He was very gifted in this respect. In the end, for about two months, he had a number of interviews with me. But I did not have to explain much of the symbolism to him.

[405] The effect of this work with his unconscious was that he became a perfectly normal and reasonable person. He did not drink any more, he became completely adapted and in every respect completely normal. The reason for this is quite obvious: that man—he was not married—had lived in a very one-sided intellectual way, and naturally had certain desires and needs also. But he had no chance with women at all, because he had no differentiation of feeling whatsoever. So he made a fool of himself with women at once, and of course they had no patience with him. And he made himself very disagreeable to men, so he was frightfully lonely. But now he had found something that fascinated him; he had a new centre of interest. He soon discovered that his dreams pointed to something very meaningful, and so his whole intuitive and scientific interest was aroused. Instead of feeling like a lost sheep, he thought: “Ah, when I am through with my work in the evening, I go to my study, and then I shall see what happens. I will work over my dreams, and then I shall discover extraordinary things.” And so it was. Of course rational judgment would say that he just fell violently into his fantasies. But that was not the case at all. He did a real bit of hard work on his unconscious, and he worked out his images scientifically. When he came to me after his three months alone, he was already almost normal. Only he still felt uncertain; he was troubled because he could not understand some of the material he had dug up from the unconscious. He asked my advice about it, and I most carefully gave him certain hints as to its meaning, but only so far as this could help him to keep on with the work and carry it through.

[406] At the end of the year I am going to publish a selection from his first four hundred dreams, where I show the development of one motif only, the central motif of these archetypal images.¹⁵ There will be an English translation later, and then you will have the opportunity to see how the method works in a case absolutely untouched by myself, or by any other outside suggestion. It is a most amazing series of images and really shows what active imagination can do. You understand, in this case it was only partially a method for objectifying the images in plastic form, because many of the symbols appeared directly in the dreams; but all the same it shows the kind of atmosphere which active imagination can produce. I have patients who, evening after evening, work at these images, painting and shaping their observations and experiences. The work has a fascination for them; it is the

fascination which the archetypes always exert upon consciousness. But by objectifying them, the danger of their inundating consciousness is averted and their positive effect is made accessible. It is almost impossible to define this effect in rational terms; it is a sort of “magical” effect, that is, a suggestive influence which goes out from the images to the individual, and in this way his unconscious is extended and is changed.

[407] I am told that Dr. Bennet has brought some pictures by a patient. Will he be so kind as to show them?

This picture (Figure 14) is meant to represent a bowl or vase. Of course it is very clumsily expressed and is a mere attempt, a suggestion of a vase or bowl. The motif of the vessel is itself an archetypal image which has a certain purpose, and I can prove from this picture what the purpose is. A vessel is an instrument for containing things. It contains for instance liquids, and prevents them from getting dispersed. Our German word for vessel is *Gefäss*, which is the noun of *fassen*, that is, to set, to contain, to take hold of. The word *Fassung* means the setting, and also, metaphorically, composure, to remain collected. So the vessel in this picture indicates the movement of containing in order to gather in and to hold together. You have to hold something together which otherwise would fall asunder. From the way this picture is composed, and from certain features in it, it is obvious that the psychology of this man contains a number of disparate elements. It is a picture characteristic of a schizophrenic condition. I do not know the case at all, but Dr. Bennet confirms that my conclusion is correct. You see the disparate elements all over the picture; there are a number of things which are not motivated and which don't belong together. Moreover, you see peculiar lines dividing the field. These lines are characteristic of a schizophrenic mentality; I call them the breaking lines. When a schizophrenic paints a picture of himself, he naturally expresses the schizophrenic split in his own mental structure, and so you find these breaking lines which often go right through a particular figure, like the breaking lines in a mirror. In this picture, the figures themselves show no breaking lines; they only go all over the field.

FIG.14. Painting by a patient

[408] This man, then, tries to gather in all the disparate elements into the vessel. The vessel is meant to be the receptacle for his whole being, for all the incompatible units. If he tried to gather them into his ego, it would be an impossible task, because the ego can be identical only with one part at a time. So he indicates by the symbol of the vessel that he is trying to find a container for everything, and therefore he gives a hint at a non-ego centre by that sort of ball or globe in the middle.

[409] The picture is an attempt at self-cure. It brings all the disparate elements into the light, and it also tries to put them together into that vessel. This idea of a receptacle is an archetypal idea. You find it everywhere, and it is one of the central motifs of unconscious pictures. It is the idea of the magic circle which is drawn round something that has to be prevented from escaping or protected against hostile influences. The magic circle as an apotropaic charm is an archaic idea which you still find in folklore. For instance, if a man digs for a treasure, he draws the magic circle round the field in order to keep the devil out. When the ground-plan of a city was set out, there used to be a ritual walk or ride round the circumference in order to protect the place within. In some Swiss villages, it is still the custom for the priest and the

town council to ride round the fields when the blessing is administered for the protection of the harvest. In the centre of the magic circle or sacred precinct is the temple. One of the most wonderful examples of this idea is the temple of Borobudur in Java. The walk round, the *circumambulatio*, is done in a spiral: the pilgrims pass the figures of all the different lives of the Buddha, until on the top there is the invisible Buddha, the Buddha yet to come. The ground-plan of Borobudur is a circle within a square. This structure is called in Sanskrit a mandala. The word means a circle, particularly a magic circle. In the East, you find the mandala not only as the ground-plan of temples, but as pictures in the temples, or drawn for the day of certain religious festivals. In the very centre of the mandala there is the god or the symbol of divine energy, the diamond thunderbolt. Round this innermost circle is a cloister with four gates. Then comes a garden, and round this there is another circle which is the outer circumference.

[410] The symbol of the mandala has exactly this meaning of a holy place, a *temenos*, to protect the centre. And it is a symbol which is one of the most important motifs in the objectivation of unconscious images.¹⁶ It is a means of protecting the centre of the personality from being drawn out and from being influenced from outside.

[411] This picture by Dr. Bennet's patient is an attempt to draw such a mandala. It has a centre, and it contains all his psychic elements, and the vase would be the magic circle, the *temenos*, round which he has to do the *circumambulatio*. Attention is thus directed towards the centre, and at the same time all the disparate elements come under observation and an attempt is made to unify them. The *circumambulatio* had always to be done clockwise. If one turned round in the other direction it was very unfavourable. The idea of the *circumambulatio* in this picture is the patient's first attempt to find a centre and a container for his whole psyche. But he does not succeed. The design shows no balance, and the vase is toppling over. It even topples over towards the left, towards the side of the unconscious. So the unconscious is still too powerful. If he wants his apotropaic magic to work, he must do it in a different way. We shall see what he does in the next picture.

[412] In this picture (Figure 15) he makes an attempt at symmetry. Now these disparate, monstrous things which he could not grasp before are collected and assimilated into more favourable, less pathological forms. He can now gather the living units of his unconscious, in the form of snakes, into the sacred vase. And the vase stands firm, it does not topple over any more, and its shape has improved. He does not succeed yet with his intention; but at least he can give his animals some form. They are all animals of the underworld, fishes that live in the deep sea, and snakes of the darkness. They symbolize the lower centres of his psychology, the sympathetic system. A most remarkable thing is that he also gathers in the stars. That means that the cosmos, his world, is collected into the picture. It is an allusion to the

unconscious astrology which is in our bones, though we are unaware of it. At the top of the whole picture is the personification of the unconscious, a naked anima-figure who turns her back. That is a typical position; in the beginning of the objectivation of these images the anima-figure often turns her back. At the foot of the vase are eight figures of the crescent moon; the moon is also a symbol of the unconscious. A man's unconscious is the lunar world, for it is the night world, and this is characterized by the moon, and Luna is a feminine designation, because the unconscious is feminine. There are still various breaking lines which disturb the harmony. But I should assume that if no particular trouble interferes, the patient will most likely continue along this constructive line. I should say that there is hope that he might come round altogether, because the appearance of the anima is rather a positive sign. She also is a sort of vase, for in the beginning she incorporates the whole of the unconscious, instead of its being scattered in all the various units. Also, the patient tries to separate the motifs to the right and to the left, and this indicates an attempt at conscious orientation. The ball or globe in the first picture has disappeared, but this is not a negative sign. The whole vessel is the centre, and he has corrected the toppling over of the vase, it stands quite firmly on its base. All this shows that he is really making an attempt to put himself right.

[413] The pictures should be given back to the patient because they are very important. You can get copies; patients like to do copies for the doctor. But he should leave the originals with the patients, because they want to look at them; and when they look at them they feel that their unconscious is expressed. The objective form works back on them and they become enchanted. The suggestive influence of the picture reacts on the psychological system of the patient and induces the same effect which he put into the picture. That is the reason for idols, for the magic use of sacred images, of icons. They cast their magic into our system and put us right, provided we put ourselves into them. If you put yourself into the icon, the icon will speak to you. Take a Lamaic mandala which has a Buddha in the centre, or a Shiva, and, to the extent that you can put yourself into it, it answers and comes into you. It has a magic effect.

[414] Because these pictures of the unconscious express the actual psychological condition of the individual, you can use them for the purpose of diagnosis. You can tell right away from such a picture where the patient stands, whether he has a schizophrenic disposition or is merely neurotic. You can even tell what his prognosis is. It only needs some experience to make these paintings exceedingly helpful. Of course, one should be careful. One should not be dogmatic and say to every patient, "Now you paint." There are people who think: "Dr. Jung's treatment consists in telling his patients to paint," just as formerly they thought: "He divides them into introverts and extraverts and says 'you should live in such and such a way, because you belong to this type or that.'" That is certainly not treatment. Each patient is a new problem for the doctor, and he will only be cured of his neurosis if you help him to find his individual way to the solution of his conflicts.

The Chairman:

[415] Ladies and Gentlemen, you have been expressing by your applause something of what you feel about Professor Jung. This is the last time in this group of talks that we will have the honour and pleasure and privilege of hearing Professor Jung. We have only inadequate ways of expressing our thanks to him for these lectures which have been so stimulating, so challenging, which have left us with so many things to think about in the future, things which to all of us, especially those who are practising psychotherapy, are enormously suggestive. I think that is what you meant to do for us, Sir, and that is what you have done. We in this Institute are extremely proud to have had you here talking to us, and all of us, I think, are harbouring the idea that before long you will be back in England to talk to us again and make us think more about these great problems.

II

SYMBOLS AND THE INTERPRETATION OF DREAMS

[This essay was composed in English and completed shortly before Jung's death in June 1961. Without title, it was written to introduce a symposium, *Man and His Symbols* (© 1964 Aldus Books, London), consisting of essays by Jung and four colleagues, edited by Jung and after his death by Dr. Marie-Louise von Franz, with John Freeman as coordinating editor. The symposium was conceived as a popular presentation of Jung's ideas, and accordingly its contents were, with the authors' agreement, extensively reworked under the supervision of John Freeman in collaboration with Dr. von Franz. Jung's essay was largely rewritten and, particularly in the opening sections, rearranged; a number of deletions were made, some explanatory passages were added, and it was given the title "Approaching the Unconscious." The present version is Jung's original text, revised by R. F. C. Hull; except for some minor transpositions the original arrangement has been preserved. The illustrations (122 in the original edn.) have been omitted. Chapter divisions and titles have been introduced in consultation with Dr. von Franz. Acknowledgment is made to Aldus Books and Doubleday and Co. for permission to incorporate some stylistic improvements from the 1964 version.—EDITORS.]

1. THE SIGNIFICANCE OF DREAMS

[416] Through his language, man tries to designate things in such a way that his words will convey the meaning of what he intends to communicate. But sometimes he uses terms or images that are not strictly descriptive and can be understood only under certain conditions. Take, for instance, the many abbreviations like UN, UNESCO, NATO, etc., which infest our newspapers, or trademarks or the names of patent medicines. Although one cannot see what they mean, they yet have a definite meaning if you know it. Such designations are not *symbols*, they are *signs*. What we call a symbol is a term, a name, or an image which in itself may be familiar to us, but its connotations, use, and application are specific or peculiar and hint at a hidden, vague, or unknown meaning. Take as an example the image of the double adze that occurs frequently on Cretan monuments. We know the object, but we do not know its specific meaning. Again, a Hindu who had been on a visit to England told his friends at home that the English worshipped animals, because he had found eagles, lions, and oxen in their old churches and cathedrals, and he was not aware that these animals were the symbols of the evangelists. There are even many Christians who do not know that they are derived from the vision of Ezekiel, which in turn offers a parallel to the Egyptian Horus and his four sons. Other examples are the wheel and the cross, which are universally known objects, yet under certain conditions they are symbolic and mean something that is still a matter for controversial speculation.

[417] A term or image is symbolic when it means more than it denotes or expresses. It has a wider “unconscious” aspect—an aspect that can never be precisely defined or fully explained. This peculiarity is due to the fact that, in exploring the symbol, the mind is finally led towards ideas of a transcendent nature, where our reason must capitulate. The wheel, for instance, may lead our thoughts to the idea of a “divine” sun, but at this point reason has to admit its inadequacy, for we are unable to define or to establish the existence of a “divine” being. We are merely human, and our intellectual resources are correspondingly limited. We may call something “divine,” but this is simply a name, a *façon de parler*. based perhaps on a creed, yet never amounting to a proof.

[418] Because there are innumerable things beyond the range of human understanding, we constantly use symbolic expressions and images when referring to them (ecclesiastical language in particular is full of symbols). But this conscious use of symbolism is only one aspect of a psychological fact of great importance: we also produce symbols unconsciously and spontaneously in our dreams.

[419] Each act of apperception, or cognition, accomplishes its task only partially: it is never complete. First of all, sense-perception, fundamental to all experience, is restricted by the limited number and quality of our senses, which can however be compensated to a certain extent by the use of instruments, but not sufficiently to eliminate entirely a fringe of uncertainty. Moreover apperception translates the observed fact into a seemingly incommensurable medium—into a psychic event, the nature of which is unknowable. Unknowable, because cognition cannot cognize itself—the psyche cannot know its own psychic substance. There is thus an indefinite number of unknown factors in every experience, in addition to which the object of cognition is always unknown in certain respects since we cannot know the ultimate nature of matter itself.

[420] Every conscious act or event thus has an unconscious aspect, just as every sense-perception has a subliminal aspect: for instance, sound below or above audibility, or light below or above visibility. The unconscious part of a psychic event reaches consciousness only indirectly, if at all. The event reveals the existence of its unconscious aspect inasmuch as it is characterized either by emotionality or by a vital importance that has not been realized consciously. The unconscious part is a sort of afterthought, which may become conscious in the course of time by means of intuition or by deeper reflection. But the event can also manifest its unconscious aspect—and this is usually the case—in a dream. The dream shows this aspect in the form of a symbolic image and not as a rational thought. It was the understanding of dreams that first enabled us to investigate the unconscious aspect of conscious psychic events and to discover its nature.

[421] It has taken the human mind a long time to arrive at a more or less rational and scientific understanding of the functional meaning of dreams. Freud was the first who tried to elucidate the unconscious background of consciousness in an empirical way. He worked on the general assumption that dream-contents are related to conscious representations through the law of association, i.e., by causal dependence, and are not merely chance occurrences. This assumption is by no means arbitrary but is based on the empirical fact, observed long ago by neurologists and especially by Pierre Janet, that neurotic symptoms are connected with some conscious experience. They even appear to be split-off areas of the conscious mind which, at another time and under different conditions, can be conscious, just as an hysterical anaesthesia can be there one moment and gone the next, only to reappear again after a while. Breuer and Freud recognized more than half a century ago that neurotic symptoms are meaningful and make sense inasmuch as they express a certain thought. In other words, they function in the same manner as dreams: they *symbolize*. A patient, for instance, confronted with an intolerable situation, develops a spasm whenever he tries to swallow: “He can’t swallow it.” Under similar conditions another patient

develops asthma: “He can’t breathe the atmosphere at home.” A third suffers from a peculiar paralysis of the legs: “He can’t go on any more.” A fourth vomits everything he eats: “He can’t stomach it.” And so on. They could all just as well have had dreams of a similar kind.

[422] Dreams, of course, display a greater variety and are often full of picturesque and luxuriant fantasy, but they boil down eventually to the same basic thought if one follows Freud’s original method of “free association.” This method consists in letting the patient go on talking about his dream-images. That is precisely what the non-psychological doctor omits to do. Being always pressed for time, he loathes letting his patient babble on about his fantasies seemingly without end. Yet, if he only knew, his patient is just about to give himself away and to reveal the unconscious background of his ailment. Anyone who talks long enough will inevitably betray himself by what he says and what he purposely refrains from saying. He may try very hard to lead the doctor and himself away from the real facts, but after a while it is quite easy to see which point he is trying to steer away from. Through apparently rambling and irrational talk, he unconsciously circumscribes a certain area to which he continually returns in ever-renewed attempts to hide it. In his circumlocutions he even makes use of a good deal of symbolism, apparently serving his purpose of hiding and avoiding yet pointing all the time to the core of his predicament.

[423] Thus, if the doctor is patient enough, he will hear a wealth of symbolic talk, seemingly calculated to hide something, a secret, from conscious realization. A doctor sees so many things from the seamy side of life that he is seldom far from the truth when he interprets the hints which his patient is emitting as signs of an uneasy conscience. What he eventually discovers, unfortunately, confirms his expectations. Thus far nobody can say anything against Freud’s theory of repression and wish-fulfilment as apparent causes dream symbolism.

[424] If one considers the following experience, however, one becomes sceptical. A friend and colleague of mine, travelling for long hours on a train journey through Russia, passed the time by trying to decipher the Cyrillic script of the railway notices in his compartment. He fell into a sort of reverie about what the letters might mean and—following the principle of “free association”—what they reminded him of, and soon he found himself in the midst of all sorts of reminiscences. Among them, to his great displeasure, he did not fail to discover those old and disagreeable companions of sleepless nights, his “complexes”—repressed and carefully avoided topics which the doctor would joyously point to as the most likely causes of a neurosis or the most convincing meaning of a dream.

[425] There was no dream, however, merely “free associations” to incomprehensible letters, which means that from any point of the compass you can reach the centre directly. Through free association you arrive at the critical secret thoughts, no matter

where you start from, be it symptoms, dreams, fantasies, Cyrillic letters or examples of modern art. At all events, this fact proves nothing with regard to dreams and their real meaning. It only shows the existence of associable material floating about. Very often dreams have a very definite, as if purposeful, structure, indicating the underlying thought or intention though, as a rule, the latter is not immediately comprehensible.

[426] This experience was an eye-opener to me, and, without dismissing the idea of “association” altogether, I thought one should pay more attention to the dream itself, i.e., to its actual form and statement. For instance, a patient of mine dreamed of a drunken, dishevelled, vulgar woman called his “wife” (though in reality his wife was totally different). The dream statement, therefore, is shocking and utterly unlike reality, yet that is what the dream says. Naturally such a statement is not acceptable and is immediately dismissed as dream nonsense. If you let the patient associate freely to the dream, he will most likely try to get away as far as possible from such a shocking thought in order to end up with one of his staple complexes, but you will have learnt nothing about the meaning of this particular dream. What is the unconscious trying to convey by such an obviously untrue statement?

[427] If somebody with little experience and knowledge of dreams should think that dreams are just chaotic occurrences without meaning, he is at liberty to do so. But if one assumes that they are normal events, which as a matter of fact they are, one is bound to consider that they are either causal—i.e., that there is a rational cause for their existence—or in some way purposive, or both; in other words, that they make sense.

[428] Clearly, the dream is seeking to express the idea of a degenerate female who is closely connected with the dreamer. This idea is projected upon his wife, where the statement becomes untrue. What does it refer to, then?

[429] Subtler minds in the Middle Ages already knew that every man “carries Eve, his wife, hidden in his body.”¹ It is this feminine element in every man (based on the minority of female genes in his biological make-up) which I have called the *anima*. “She” consists essentially in a certain inferior kind of relatedness to the surroundings and particularly to women, which is kept carefully concealed from others as well as from oneself. A man’s visible personality may seem quite normal, while his anima side is sometimes in a deplorable state. This was the case with our dreamer: his female side was not nice. Applied to his anima, the dream-statement hits the nail on the head when it says: you are behaving like a degenerate female. It hits him hard as indeed it should. One should not, however, understand such a dream as evidence for the *moral nature* of the unconscious. It is merely an attempt to balance the lopsidedness of the conscious mind, which had believed the fiction that one was a perfect gentleman throughout.

[430] Such experiences taught me to mistrust free association. I no longer followed associations that led far afield and away from the manifest dream-statement. I concentrated rather on the actual dream-text as the thing which was intended by the unconscious, and I began to circumambulate the dream itself, never letting it out of my sight, or as one turns an unknown object round and round in one's hands to absorb every detail of it.

[431] But why should one consider dreams, those flimsy, elusive, unreliable, vague, and uncertain phantasms, at all? Are they worthy of our attention? Our rationalism would certainly not recommend them, and the history of dream interpretation before Freud was a sore point anyway; most discouraging in fact, most "unscientific" to say the least of it. *Yet dreams are the commonest and universally accessible source for the investigation of man's symbolizing faculty*, apart from the contents of psychoses, neuroses, myths, and the products of the various arts. All these, however, are more complicated and more difficult to understand, because, when it comes to the question of their individual nature, one cannot venture to interpret such unconscious products without the aid of the originator. Dreams are indeed the chief source of all our knowledge about symbolism.

[432] One cannot *invent* symbols; wherever they occur, they have not been devised by conscious intention and wilful selection, because, if such a procedure had been used, they would have been nothing but signs and abbreviations of conscious thoughts. Symbols occur to us spontaneously, as one can see in our dreams, which are not invented but which happen to us. They are not immediately understandable, they need careful analysis by means of association, but, as I have said, not of "free association," which we know always leads back eventually to the emotional thoughts or complexes that are unconsciously captivating our mind. To get there, we have no need of dreams. But in the early days of medical psychology the general assumption was that dreams were analysed for the purpose of discovering complexes. For this purpose, however, it is sufficient to conduct an association test, which supplies all the necessary hints as I have shown long ago. And not even this test is necessary, because one can obtain the same result by letting people talk long enough.

[433] There can be no doubt that dreams often arise from an emotional disturbance in which the habitual complexes are involved. The habitual complexes are the tender spots of the psyche, which react most quickly to a problematical external situation. But I began to suspect that dreams might have another, more interesting function. The fact that they eventually lead back to the complexes is not the specific merit of dreams. If we want to learn what a dream means and what specific function it fulfils, we must disregard its inevitable outcome, the complex. We must put a check on limitless "free" association, a restriction provided by the dream itself. By free association, we move away from the individual dream-image and lose sight of it. We

must, on the contrary, keep close to the dream and its individual form. The dream is its own limitation. It is itself the criterion of what belongs to it and of what leads away from it. All material that does not lie within the scope of the dream, or that oversteps the boundaries set by its individual form, leads astray and produces nothing but the complexes, and we do not know whether they belong to the dream or not since they can be produced in so many other ways. There is, for instance, an almost infinite variety of images by which the sexual act can be “symbolized,” or rather allegorized. But the dream obviously intends its own specific expression in spite of the fact that the resultant associations will lead to the idea of sexual intercourse. This is no news and is easy to see, but the real task is to understand why the dream has chosen its own individual expression.

[434] Only the material that is clearly and visibly indicated as belonging to the dream by the dream-images themselves should be used for interpretation. While free association moves away from the theme of the dream in something like a zigzag line, the new method, as I have always said, is more like a circumambulation, the centre of which is the dream-image. One concentrates on the specific topics, on the dream itself, and disregards the frequent attempts of the dreamer to break away from it. This ever-present “neurotic” dissociative tendency has many aspects, but at bottom it seems to consist in a basic resistance of the conscious mind to anything unconscious and unknown. As we know, this often fierce resistance is typical of the psychology of primitive societies, which are as a rule conservative and show pronounced misoneistic tendencies. Anything new and unknown causes distinct and even superstitious fear. The primitive manifests all the reactions of a wild animal to untoward events. Our highly differentiated civilization is not at all free from such primitive behaviour. A new idea that is not exactly in line with general expectations meets with the severest obstacles of a psychological kind. It is given no credit, but is feared, combatted, and abhorred in every way. Many pioneers can tell a story of misery, all due to the primitive misoneism of their contemporaries. When it comes to psychology, one of the youngest of the sciences, you can see misoneism at work, and in dealing with your own dreams you can easily observe your reactions when you have to admit a disagreeable thought. It is chiefly and above all fear of the unexpected and unknown that makes people eager to use free association as a means of escape. I do not know how many times in my professional work I have had to repeat the words: “Now let’s get back to your dream. What does the *dream* say?”

[435] If one wants to understand a dream it must be taken seriously, and one must also assume that it means what it manifestly says, since there is no valid reason to suppose that it is anything other than it is. Yet the apparent futility of dreams is so overwhelming that not only the dreamer but the interpreter as well may easily

succumb to the prejudice of the “nothing but” explanation. Whenever a dream gets difficult and obstinate, the temptation to dismiss it altogether is not far away.

[436] When I was doing fieldwork with a primitive tribe in East Africa, I discovered to my amazement that they denied having dreams at all. But by patient indirect talk I soon found that they had dreams all right, like everybody else, but were convinced that their dreams meant nothing. “Dreams of ordinary men mean nothing,” they said. The only dreams that mattered were those of the chief and the medicine-man, which concerned the welfare of the tribe. Such dreams were highly appreciated. The only drawback was that the chief as well as the medicine-man denied having any more dreams “since the British were in the country.” The District Commissioner had taken over the function of the “big dream.”

[437] This incident shows that even in a primitive society opinions about dreams are ambivalent, just as in our society, where most people see nothing in dreams while a minority thinks very highly of them. The Church, for instance, has long known of *somnia a Deo missa* (dreams sent by God), and in our own time we have watched the growth of a scientific discipline which aims at exploring the vast field of unconscious processes. Yet the average man thinks little or nothing about dreams, and even a thoroughly educated person shares the common ignorance and underrates everything remotely connected with the “unconscious.”

[438] The very existence of an unconscious psyche is denied by a great number of scientists and philosophers, who often use the naïve argument that if there were an unconscious psyche there would be two subjects in the individual instead of one. But that is precisely the case, in spite of the supposed unity of the personality. It is, indeed, the great trouble of our time that so many people exist whose right hand does not know what their left is doing. It is by no means the neurotic alone who finds himself in this predicament. It is not a recent development, nor can it be blamed on Christian morality; it is, on the contrary, the symptom of a general unconsciousness that is the heritage of all mankind.

[439] The development of consciousness is a slow and laborious process that took untold ages to reach the civilized state (which we date somewhat arbitrarily from the invention of writing, about 4000 B.C.). Although the development since that date seems to be considerable, it is still far from complete. Indefinitely large areas of the mind still remain in darkness. What we call “psyche” is by no means identical with consciousness and its contents. Those who deny the existence of the unconscious do not realize that they are actually assuming our knowledge of the psyche to be complete, with nothing left for further discoveries. It is exactly as if they declared our present knowledge of nature to be the summit of all possible knowledge. Our psyche is part of nature, and its enigma is just as limitless. We cannot define “nature” or “psyche,” but can only state what, at present, we understand them to be. No man in

his senses, therefore, could make such a statement as “there is no unconscious,” i.e., no psychic contents of which he and others are unconscious—not to mention the mountain of convincing evidence that medical science has accumulated. It is not, of course, scientific responsibility or honesty that causes such resistance, but age-old misoneism, fear of the new and unknown.

[440] This peculiar resistance to the unknown part of the psyche has its historical reasons. Consciousness is a very recent acquisition and as such is still in an “experimental state”—frail, menaced by specific dangers, and easily injured. As a matter of fact one of the most common mental derangements among primitives consists in the “loss of a soul,” which, as the term indicates, means a noticeable dissociation of consciousness. On the primitive level the psyche or soul is by no means a unit, as is widely supposed. Many primitives assume that, as well as his own, a man has a “bush-soul,” incarnate in a wild animal or a tree, with which he is connected by a kind of psychic identity. This is what Lévy-Bruhl called *participation mystique*.² In the case of an animal it is a sort of brother, so much so that a man whose brother is a crocodile is supposed to be safe while swimming across a crocodile-infested river. In the case of a tree, the tree is supposed to have authority over the individual like a parent. Injury to the bush-soul means an equal injury to the man. Others assume that a man has a number of souls, which shows clearly that the primitive often feels that he consists of several units. This indicates that his psyche is far from being safely synthesized; on the contrary, it threatens to fall asunder only too easily under the onslaught of unchecked emotions.

[441] What we observe in the seemingly remote sphere of the primitive mind has by no means vanished in our advanced civilization. Only too often, as I have said, the right hand does not know what the left is doing, and in a state of violent affect one frequently forgets who one is, so that people can ask: “What the devil has got into you?” We are possessed and altered by our moods, we can suddenly be unreasonable, or important facts unaccountably vanish from our memory. We talk about being able to “control ourselves,” but self-control is a rare and remarkable virtue. If you ask your friends or relatives they may be able to tell you things about yourself of which you have no knowledge. One almost always forgets or omits to apply to oneself the criticism that one hands out so freely to others, fascinated by the mote in one’s brother’s eye.

[442] All these well-known facts show beyond a doubt that, on the heights of our civilization, human consciousness has not yet attained a reasonable degree of continuity. It is still dissociable and vulnerable, in a way fortunately so, since the dissociability of the psyche is also an advantage in that it enables us to concentrate on one point by dismissing everything else that might claim attention. It makes a great difference, however, whether your consciousness purposely splits off and suppresses

a part of the psyche temporarily, or whether the same thing *happens* to you, so that the psyche splits spontaneously without your consent and knowledge, or perhaps even against your will. The first is a civilized achievement, the second a primitive and archaic condition or a pathological event and the cause of a neurosis. It is the “loss of a soul,” the symptom of a still existing mental primitivity.

[443] It is a long way indeed from primitivity to a reliable cohesion of consciousness. Even in our days the unity of consciousness is a doubtful affair, since only a little affect is needed to disrupt its continuity. On the other hand the perfect control of emotion, however desirable from one point of view, would be a questionable accomplishment, for it would deprive social intercourse of all variety, colour, warmth, and charm.

2. THE FUNCTIONS OF THE UNCONSCIOUS

[444] Our *new* method treats the dream as a spontaneous product of the psyche about which there is no previous assumption except that it somehow makes sense. This is no more than every science assumes, namely that its object is worthy of investigation. No matter how low one's opinion of the unconscious may be, the unconscious is at least on a level with the louse, which, after all, enjoys the honest interest of the entomologist. As to the alleged boldness of the hypothesis that an unconscious psyche exists, I must emphasize that a more modest formulation could hardly be imagined. It is so simple that it amounts to a tautology: a content of consciousness disappears and cannot be reproduced. The best we can say of it is: the thought (or whatever it was) has become unconscious, or is cut off from consciousness, so that it cannot even be remembered. Or else it may happen that we have an inkling or hunch of something which is about to break into consciousness: "something is in the air," "we smell a rat," and so on. To speak under these conditions of latent or unconscious contents is hardly a daring hypothesis.

[445] When something vanishes from consciousness it does not dissolve into thin air or cease to exist, any more than a car disappearing round a corner becomes non-existent. It is simply out of sight, and, as we may meet the car again, so we may come across a thought again which was previously lost. We find the same thing with sensation, as the following experiment proves. If you produce a continuous note on the edge of audibility, you will observe in listening to it that at regular intervals it is audible and inaudible. These oscillations are due to a periodic increase and decrease of attention. The note never ceases to exist with static intensity. It is merely the decrease of attention that causes its apparent disappearance.

[446] The unconscious, therefore, consists in the first place of a multitude of temporarily eclipsed contents which, as experience shows, continue to influence the conscious processes. A man in a distracted state of mind goes to a certain place in his room, obviously to fetch something. Then he suddenly stops perplexed: he has forgotten why he got up and what he was after. He gropes absent-mindedly among a whole collection of objects, completely at sea as to what he wants to find. Suddenly he wakes up, having discovered the thing he wants. He behaves like a man walking in his sleep oblivious of his original purpose, yet unconsciously guided by it. If you observe the behaviour of a neurotic, you can see him performing apparently conscious and purposeful acts yet, when you ask him about them, you discover to your surprise that he is either unconscious of them or has something quite different in

mind. He hears and does not hear, he sees yet is blind, he knows and does not know at the same time. Thousands of such observations have convinced the specialist that unconscious contents behave as if they were conscious, and that you can never be sure whether thought, speech, or action is conscious or not. Something so obvious to yourself that you cannot imagine it to be invisible to anybody can be as good as nonexistent to your fellows, and yet they behave as if they were just as conscious of it as you are yourself.

[447] This kind of behaviour has given rise to the medical prejudice that hysterical patients are confirmed liars. Yet the surplus of lies they seem to produce is due to the uncertainty of their mental state, to the dissociability of their consciousness, which is liable to unpredictable eclipses, just as their skin shows unexpected and changing areas of anaesthesia. There is no certainty whether a needle-prick will be registered or not. If their attention can be focused on a certain point, the whole surface of their body may be completely anaesthetized, and, when attention relaxes, sense-perception is instantly restored. Moreover when one hypnotizes such cases one can easily demonstrate that they are aware of everything that has been done in an anaesthetized area or during an eclipse of consciousness. They can remember every detail just as if they had been fully conscious during the experiment. I recall a similar case of a woman who was admitted to the clinic in a state of complete stupor. Next day when she came to, she knew who she was, but did not know where she was nor how or why she had come there, nor did she know the date. I hypnotized her, and she could tell me a verifiable story of why she fell ill, how she had got to the clinic, and who had received her, with all the details. As there was a clock in the entrance hall, though not in a very conspicuous place, she could also remember the time of her admission to the minute. Everything happened as if she had been in a completely normal condition and not deeply unconscious.

[448] It is true that the bulk of our evidential material comes from clinical observation. That is the reason why many critics assume that the unconscious and its manifestations belong to the sphere of psychopathology as neurotic or psychotic symptoms and that they do not occur in a normal mental state. But, as has been pointed out long ago, neurotic phenomena are not by any means the exclusive products of disease. They are as a matter of fact *normal occurrences pathologically exaggerated, and therefore* just more obvious than their normal parallels. One can indeed observe all hysterical symptoms in a diminutive form in normal individuals, but they are so slight that they usually pass unnoticed. In this respect, everyday life is a mine of evidential material.

[449] Just as conscious contents can vanish into the unconscious, other contents can also arise from it. Besides a majority of mere recollections, really new thoughts and creative ideas can appear which have never been conscious before. They grow up

from the dark depths like a lotus, and they form an important part of the subliminal psyche. This aspect of the unconscious is of particular relevance in dealing with dreams. One must always bear in mind that dream material does not necessarily consist of memories; it may just as well contain new thoughts that are not yet conscious.

[450] Forgetting is a normal process, in which certain conscious contents lose their specific energy through a deflection of attention. When interest turns elsewhere, it leaves former contents in the shadow, just as a searchlight illuminates a new area by leaving another to disappear in the darkness. This is unavoidable, for consciousness can keep only a few images in full clarity at one time, and even this clarity fluctuates, as I have mentioned. "Forgetting" may be defined as temporarily subliminal contents remaining outside the range of vision against one's will. But the forgotten contents have not ceased to exist. Although they cannot be reproduced they are present in a subliminal state, from which they can rise up spontaneously at any time, often after many years of apparently total oblivion, or they can be fetched back by hypnosis.

[451] Besides normal forgetting, there are the cases described by Freud of disagreeable memories which one is only too ready to lose. As Nietzsche has remarked, when pride is insistent enough, memory prefers to give way. Thus among the lost memories we encounter not a few that owe their subliminal state (and their incapacity to be reproduced at will) to their disagreeable and incompatible nature. These are the *repressed* contents.

[452] As a parallel to normal forgetting, *subliminal sense-perceptions* should be mentioned, because they play a not unimportant role in our daily life. We see, hear, smell and taste many things without noticing them at the time, either because our attention is deflected or because the stimulus is too slight to produce a conscious impression. But in spite of their apparent non-existence they can influence consciousness. A well-known example is the case of the professor walking in the country with a pupil, deep in serious conversation. Suddenly he notices that his thoughts are interrupted by an unexpected flow of memories from his early childhood. He cannot account for it, as he is unable to discover any associative connection with the subject of his conversation. He stops and looks back: there at a little distance is a farm, through which they had passed a short while ago, and he remembers that soon afterwards images of his childhood began to surge up. "Let us go back to the farm," he says to his pupil; "it must be about there that my fantasies started." Back at the farm, the professor notices the smell of geese. Instantly he recognizes it as the cause of the interruption: in his early youth he had lived on a farm where there were geese, whose characteristic smell had formed a lasting impression and caused the reproduction of the memory-images. He had noticed the

smell while passing the farmyard, subliminally, and the unconscious perception had called back long-forgotten memories.

[453] This example illustrates how the subliminal perception released early childhood memories, the energetic tension of which proved to be strong enough to interrupt the conversation. The perception was subliminal because the attention was engaged elsewhere, and the stimulus was not strong enough to deflect it and to reach consciousness directly. Such phenomena are frequent in everyday life, but mostly they pass unnoticed.

[454] A relatively rare but all the more astonishing phenomenon that falls into the same category is *cryptomnesia*, or the “concealed recollection.” It consists in the fact that suddenly, mostly in the flow of creative writing, a word, a sentence, an image, a metaphor, or even a whole story appears which may exhibit a strange or otherwise remarkable character. If you ask the author where this fragment comes from, he does not know, and it becomes obvious that he has not even noticed it as anything peculiar. I will quote one such example from Nietzsche’s *Thus Spake Zarathustra*. The author describes Zarathustra’s “descent to hell” with certain characteristic details which coincide almost word for word with the narration in a ship’s log from the year 1686.

[455] Nietzsche, *Thus Spake Zarathustra* (1883)¹

Now about the time that Zarathustra sojourned on the Happy Isles, it happened that a ship anchored at the isle on which the smoking mountain stands, and the crew went ashore to shoot rabbits. About the noontide hour, however, when the captain and his men were together again, they suddenly saw a man coming towards them through the air, and a voice said distinctly: “It is time! It is highest time!” But when the figure drew close to them, flying past quickly like a shadow in the direction of the volcano, they recognized with the greatest dismay that it was Zarathustra.... “Behold,” said the old helmsman, “Zarathustra goes down to hell!”

Justinus Kerner, *Blätter aus Prevorst* (1831–39)²

The four captains and a merchant, Mr. Bell, went ashore on the island of Mount Stromboli to shoot rabbits. At three o’clock they mustered the crew to go aboard, when, to their inexpressible astonishment, they saw two men flying rapidly towards them through the air. One was dressed in black, the other in grey. They came past them very closely, in the greatest haste, and to their utmost dismay descended into the crater of the terrible volcano, Mount Stromboli. They recognized the pair as acquaintances from London.

[456] When I read Nietzsche’s story I was struck by its peculiar style, which is different from Nietzsche’s usual language, and by the strange images of a ship anchored off a mythological island, of a captain and his crew shooting rabbits, and of the descent to

hell of a man who was recognized as an old acquaintance. The parallels with Kerner could not be a mere coincidence. Kerner's collection dates from about 1835 and is probably the only extant source of the seaman's yarn. At least I was certain that Nietzsche must have gleaned it from there. He retells the story with a few significant variations and as if it were his own invention. As it was in the year 1902 that I came across this case, I still had the opportunity to write to Elizabeth Förster-Nietzsche, the author's sister, and she remembered that she and her brother had read the *Blätter aus Prevorst* when Nietzsche was eleven years old, though she did not remember this particular story. The reason why I remembered it was that I had come across Kerner's collection four years before, in a private library; and, as I was interested in the writings of the physicians of that time as the forerunners of medical psychology, I had read through all the volumes of the *Blätter*. Naturally I should have forgotten the yarn in the course of time, because it did not interest me in any way. But in reading Nietzsche I suddenly had a *sentiment du déjà vu*, followed by a dim recollection of old-fashioned cut, and gradually the picture of Kerner's book filtered into my consciousness.

[457] Benoît, who produced a surprising parallel to Rider Haggard's *She* in his novel *L'Atlantide*, when accused of plagiarism had to answer that he had never come across Rider Haggard's book and was entirely unaware of its existence. This case could also have been one of cryptomnesia, if it had not been an elaboration of a sort of *representation collective*, as Lévy-Bruhl has named certain general ideas characteristic of primitive societies. I shall be dealing with these later on.

[458] What I have said about the unconscious will give the reader a fair idea of the subliminal material on which the spontaneous production of dream-symbols is based. It is evidently material that owes its unconsciousness chiefly to the fact that certain conscious contents must necessarily lose their energy, i.e., the attention bestowed on them, or their specific emotional tone, in order to make room for new contents. If they were to retain their energy, they would remain above the threshold and one could not get rid of them. It is as if consciousness were a sort of projector that casts its light (of attention or interest) on new perceptions—due to arrive presently—as well as on the traces of former ones in a dormant state. As a conscious act, this process can be understood as an intentional and voluntary event. Yet just as often consciousness is forced to turn on its light by the intensity of an external or internal stimulus.

[459] This observation is not superfluous, for there are many people who overestimate the role of will-power and think nothing can happen in their minds that they do not intend. But, for the sake of psychological understanding, one should learn to discriminate carefully between *intentional and unintentional contents*. The former are derived from the ego-personality, while the latter arise from a source which is not

identical with the ego, that is, from a subliminal part of the ego, from its “other side,” which is in a way another subject. The existence of this other subject is by no means a pathological symptom, but a normal fact that can be observed at any time anywhere.

[460] I once had a discussion with one of my colleagues about another doctor who had done something I had qualified as “utterly idiotic.” This doctor was my colleague’s personal friend, and moreover a believer in the somewhat fanatical creed to which my colleague subscribed. Both were teetotalers. He impulsively replied to my criticism: “Of course he is an ass”—pulling himself up short—“a highly intelligent man, I meant to say.” I mildly remarked that the ass came first, whereupon he angrily denied ever having said such a thing about his friend, and to an unbeliever at that. This man was highly regarded as a scientist, but his right hand did not know what his left was doing. Such people are not fit for psychology and, as a matter of fact, do not like it. But that is the way the voice from the other side is usually treated: “I didn’t mean it, I never said so.” And in the end, as Nietzsche says, memory prefers to give way.

3. THE LANGUAGE OF DREAMS

[461] All contents of consciousness have been or can become subliminal, thus forming part of the psychic sphere which we call the unconscious. All urges, impulses, intentions, affects, all perceptions and intuitions, all rational and irrational thoughts, conclusions, inductions, deductions, premises, etc., as well as all categories of feeling, have their subliminal equivalents, which may be subject to partial, temporary, or chronic unconsciousness. One uses a word or a concept, for instance, that in another connection has an entirely different meaning of which one is momentarily unconscious, and this can lead to a ridiculous or even disastrous misunderstanding. Even a most carefully defined philosophical or mathematical concept, which we are sure does not contain more than we have put into it, is nevertheless more than we assume. It is at the least a psychic event, the nature of which is actually unknowable. The very numbers you use in counting are more than you take them for. They are at the same time mythological entities (for the Pythagoreans they were even divine), but you are certainly unaware of this when you use numbers for a practical purpose.

[462] We are also unconscious of the fact that general terms like “state,” “money,” “health,” “society” etc. usually mean more than they are supposed to signify. They are general only because we assume them to be so, but in practical reality they have all sorts of nuances of meaning. I am not thinking of the deliberate twisting of such concepts in their Communist usage, but of the fact that even when they are understood in their proper sense they nevertheless vary slightly from person to person. The reason for this variation is that a general notion is received into an individual context and is therefore understood and used in an individual way. As long as concepts are identical with mere words, the variation is almost imperceptible and of no practical importance. But when an exact definition or a careful explanation is needed, one can occasionally discover the most amazing variations, not only in the purely intellectual understanding of the term, but particularly in its emotional tone and its application. As a rule these variations are subliminal and therefore never realized.

[463] One may dismiss such differences as redundant or over-nice distinctions, but the fact that they exist shows that even the most banal contents of consciousness have a penumbra of uncertainty around them, which justifies us in thinking that each of them carries a definite subliminal charge. Although this aspect plays little role in everyday life, one must bear it in mind when analysing dreams. I recall a dream of

my own that baffled me for a while. In this dream, a certain Mr. X was desperately trying to get behind me and jump on my back. I knew nothing of this gentleman except that he had succeeded in twisting something I had said into a rather grotesque travesty of my meaning. This kind of thing had frequently happened to me in my professional life, and I had never bothered to realize whether it made me angry or not. But as it is of practical importance to maintain conscious control of one's emotions, the dream pointedly brought up the incident again in the apparent "disguise" of a colloquialism. This saying, common enough in ordinary speech, is "Du kannst mir auf den Buckel steigen" (you can climb on my back), which means "I don't give a damn what you say."

[464] One could say that this dream-image was symbolic, for it did not state the situation directly but in a roundabout way, through a concretized colloquial metaphor which I did not understand at first sight. Since I have no reason to believe that the unconscious has any intention of concealing things, I must be careful not to project such a device on its activity. It is characteristic of dreams to prefer pictorial and picturesque language to colourless and merely rational statements. This is certainly not an intentional concealment; it simply emphasizes our inability to understand the emotionally charged picture-language of dreams.

[465] As daily adaptation to the reality of things demands accurate statements, we have learnt to discard the trimming of fantasy, and have thus lost a quality that is still characteristic of the primitive mind. Primitive thinking sees its object surrounded by a fringe of associations which have become more or less unconscious in civilized man. Thus animals, plants, and inanimate objects can acquire properties that are most unexpected to the white man. A nocturnal animal seen by day is, for the primitive, quite obviously a medicine-man who has temporarily changed his shape; or else it is a doctor-animal or an animal-ancestor, or somebody's bush-soul. A tree can be part of a man's life, it has a soul and a voice, and the man shares its fate, and so on. Certain South American Indians assure you that they are red *araras* (parrots), although they are quite aware that they have no feathers and don't look like birds. In the primitive's world, things do not have the same sharp boundaries they do in ours. What we call psychic identity or *participation mystique* has been stripped off our world of things. It is exactly this halo, or "fringe of consciousness," as William James calls it, which gives a colourful and fantastic aspect to the primitive's world. We have lost it to such a degree that we do not recognize it when we meet it again, and are baffled by its incomprehensibility. With us such things are kept below the threshold; and when they occasionally reappear, we are convinced that something is wrong.

[466] I have more than once been consulted by highly educated and otherwise intelligent people because they had peculiar dreams, involuntary fantasies, or even visions, which shocked or frightened them. They assumed that nobody in a sound

mental condition could suffer from such phenomena, and that a person who had a vision was certainly pathological. A theologian I knew once avowed his belief that Ezekiel's visions were morbid symptoms, and that when Moses and other prophets heard "voices" they were suffering from hallucinations. Naturally he got into a panic when some spontaneous events of this kind happened to him. We are so used to the rational surface of our world that we cannot imagine anything untoward happening within the confines of common sense. If our mind once in a while does something thoroughly unexpected, we are terrified and immediately think of a pathological disturbance, whereas primitive man would think of fetishes, spirits, or gods but would never doubt his sanity. Modern man is very much in the situation of the old doctor who was himself a psychotic patient. When I asked him how he was, he replied that he had had a wonderful night disinfecting the whole heaven with chloride of mercury but had found no trace of God. What we find instead of God is a neurosis or something worse, and the fear of God has changed into a phobia or anxiety neurosis. The emotion remains the same, only its object has changed its name and nature for the worse.

[467] I remember a professor of philosophy and psychology who consulted me about his cancer phobia. He suffered from a compulsive conviction that he had a malignant tumour, although nothing of the sort was ever found in dozens of X-ray pictures. "Oh, I know there is nothing," he would say, "but there still *might* be something." Such a confession is certainly far more humiliating to a strong intellect than the belief of a primitive that he is plagued by a ghost. Malevolent spirits are at least a perfectly admissible hypothesis in a primitive society, but it is a shattering experience for a civilized person to have to admit that he is the victim of nothing more than a foolish prank of the imagination. The primitive phenomenon of obsession has not vanished, it is the same as ever. It is only interpreted in a different and more obnoxious way.

[468] Many dreams present images and associations that are analogous to primitive ideas, myths, and rites. These dream-images were called "archaic remnants" by Freud. The term suggests that they are psychic elements left over from times long ago and still adhering to our modern mind. This point of view forms part of the prevailing depreciation of the unconscious as a mere appendix of consciousness or, to put it more drastically, a dustbin which collects all the refuse of the conscious mind—all things discarded, disused, worthless, forgotten, and repressed.

[469] This opinion had to be abandoned in more recent times, since further investigation has shown that such images and associations belong to the regular structure of the unconscious and can be observed more or less everywhere, in the dreams of highly educated as well as illiterate people, of the intelligent as well as the stupid. They are in no sense dead or meaningless "remnants"; on the contrary, they still continue to function and are therefore of vital value just because of their

“historical” nature. They are a sort of language that acts as a bridge between the way in which we consciously express our thoughts and a more primitive, more colourful and pictorial form of expression—a language that appeals directly to feeling and emotion. Such a language is needed to translate certain truths from their “cultural” form (where they are utterly ineffectual) into a form that hits the nail on the head. For instance, there is a lady well known for her stupid prejudices and stubborn arguments. The doctor tries in vain to instil some insight. He says: “My dear lady, your views are indeed very interesting and original. But you see, there are many people who unfortunately lack your assumptions and have need of your forbearance. Couldn’t you ...” etc. He could just as well talk to a stone. But the dream follows a different method. She dreams: there is a great social affair to which she is invited. She is received by her hostess (a very bright woman) at the door with the words: “Oh, how nice that you have come, all your friends are already here and are expecting you.” She leads her to a door, opens it, and the lady steps into—a cowshed.

[470] This is a more concrete and drastic language, simple enough to be understood even by a blockhead. Although the lady would not admit the point of the dream, it nevertheless went home, and after a time she was forced to accept it because she could not help seeing the self-inflicted joke.

[471] The message of the unconscious is of greater importance than most people realize. As consciousness is exposed to all sorts of external attractions and distractions, it is easily led astray and seduced into following ways that are unsuited to its individuality. The general function of dreams is to balance such disturbances in the mental equilibrium by producing contents of a complementary or compensatory kind. Dreams of high vertiginous places, balloons, aeroplanes, flying and falling, often accompany states of consciousness characterized by fictitious assumptions, overestimation of oneself, unrealistic opinions, and grandiose plans. If the warning of the dream is not heeded, real accidents take its place. One stumbles, falls downstairs, runs into a car, etc. I remember the case of a man who was inextricably involved in a number of shady affairs. He developed an almost morbid passion for dangerous mountain-climbing as a sort of compensation: he was trying to “get above himself.” In one dream he saw himself stepping off the summit of a high mountain into the air. When he told me his dream, I instantly saw the risk he was running, and I tried my best to emphasize the warning and convince him of the need to restrain himself. I even told him that the dream meant his death in a mountain accident. It was in vain. Six months later he “stepped off into the air.” A mountain guide watched him and a young friend letting themselves down on a rope in a difficult place. The friend had found a temporary foothold on a ledge, and the dreamer was following him down. Suddenly he let go of the rope “as if he were jumping into the air,” as the guide reported afterwards. He fell on his friend, and both went down and were killed.

[472] Another typical case was that of a lady who was living above herself in a fantasy of distinction and austerity. But she had shocking dreams, reminding her of all sorts of unsavoury things. When I put my finger on them, she indignantly refused to acknowledge them. The dreams then became menacing, full of references to the long lonely walks she took in the woods near the town, where she indulged in soulful musings. I saw the danger and warned her insistently, but she would not listen. A week later a sexual pervert attacked her murderously, and only in the nick of time was she rescued by some people who had heard her screams. Obviously she had a secret longing for some such adventure and preferred to pay the price of two broken ribs and the fracture of a laryngeal cartilage, just as the mountain climber at least had the satisfaction of finding a definite way out of his predicament.

[473] Dreams prepare, announce, or warn about certain situations, often long before they actually happen. This is not necessarily a miracle or a precognition. Most crises or dangerous situations have a long incubation, only the conscious mind is not aware of it. Dreams can betray the secret. They often do, but just as often, it seems, they do not. Therefore our assumption of a benevolent hand restraining us in time is doubtful. Or, to put it more positively, it seems that a benevolent agency is at work sometimes but at other times not. The mysterious finger may even point the way to perdition. One cannot afford to be naïve in dealing with dreams. They originate in a spirit that is not quite human, but is rather the breath of nature—of the beautiful and generous as well as the cruel goddess. If we want to characterize this spirit, we would do better to turn to the ancient mythologies and the fables of the primeval forest. Civilization is a most expensive process and its acquisitions have been paid for by enormous losses, the extent of which we have largely forgotten or have never appreciated.

[474] Through our efforts to understand dreams we become acquainted with what William James has aptly called the “fringe of consciousness.” What appear to be redundant and unwelcome accessories are, if studied more closely, the almost invisible roots of conscious contents, i.e., their subliminal aspects. They form the psychic material that must be considered as the intermediary between unconscious and conscious contents, or the bridge that spans the gap between consciousness and the ultimately physiological foundations of the psyche. The practical importance of such a bridge can hardly be overrated. It is the indispensable link between the rational world of consciousness and the world of instinct. The more our consciousness is influenced by prejudices, fantasies, infantile wishes, and the lure of external objects, the more the already existing gap will widen out into a neurotic dissociation and lead to an artificial life far removed from healthy instincts, nature, and truth. Dreams try to re-establish the equilibrium by restoring the images and emotions that express the state of the unconscious. One can hardly ever restore the original condition by rational talk, which is far too flat and colourless. But, as my

examples have shown, the language of dreams provides just those images which appeal to the deeper strata of the psyche. One could even say that the interpretation of dreams enriches consciousness to such an extent that it re-learns the forgotten language of the instincts.

[475] In so far as instincts are physiological urges, they are perceived by the senses and at the same time manifest themselves as fantasies. But in so far as they are not perceived sensually, they reveal their presence only in images. The vast majority of instinctive phenomena consists, however, of images, many of which are of a symbolic nature whose meaning is not immediately recognizable. One finds them chiefly in that twilight realm between dim consciousness and the unconscious background of the dream. Sometimes a dream is of such vital importance that its message reaches consciousness no matter how uncomfortable or shocking it may be. From the standpoint of mental equilibrium and physiological health in general, it is much better for the conscious and the unconscious to be connected and to move on parallel lines than for them to be dissociated. In this respect the production of symbols can be considered a most valuable function.

[476] One will naturally ask what is the point of this function if its symbols should pass unnoticed or prove to be incomprehensible? But lack of conscious understanding does not mean that the dream has no effect at all. Even civilized man can occasionally observe that a dream which he cannot remember can slightly alter his mood for better or worse. Dreams can be “understood” to a certain extent in a subliminal way, and that is mostly how they work. Only when a dream is very impressive, or repeats itself often, do interpretation and conscious understanding become desirable. But in pathological cases an interpretation is imperative and should be undertaken if there are no counter-indications, such as the existence of a latent psychosis, which is, as it were, only waiting for a suitable releasing agent to burst forth in full force. Unintelligent and incompetent application of dream analysis and interpretation is indeed not advisable, and particularly not when there is a dissociation between a very onesided consciousness and a correspondingly irrational or “crazy” unconscious.

[477] Owing to the infinite variety of conscious contents and their deviation from the ideal middle line, the unconscious compensation is equally varied, so that one would be hard put to it to say whether dreams and their symbols are classifiable or not. Though there are dreams and occasional symbols—better called motifs in this case—which are typical and occur often, most dreams are individual and atypical. Typical motifs are falling, flying, being chased by dangerous animals or men being insufficiently or absurdly clothed in public places, being in a hurry or lost in a milling crowd, fighting with useless weapons or being utterly defenceless, running and

getting nowhere, and so on. A typical infantile motif is the dream of growing infinitely small or infinitely big, or of being transformed from the one into the other.

[478] A noteworthy phenomenon is the recurrent dream. There are cases of dreams repeating themselves from the days of childhood to the advanced years of adult life. Such dreams usually compensate a defect in one's conscious attitude, or they date from a traumatic moment that has left behind some specific prejudice, or they anticipate a future event of some importance. I myself dreamt of a motif that was repeated many times over a period of years. It was that I discovered a part of a wing of my house which I did not know existed. Sometimes it was the place where my parents lived—who had died long ago—where my father, to my great surprise, had a laboratory in which he studied the comparative anatomy of fishes, and where my mother ran a hostelry for ghostly visitors. Usually the wing or independent guest-house was an historical building several hundred years old, long forgotten, yet my ancestral property. It contained interesting old furniture, and towards the end of this series of recurrent dreams I discovered an old library whose books were unknown to me. Finally, in the last dream, I opened one of the old volumes and found in it a profusion of the most marvellous symbolic pictures. When I awoke, my heart was pounding with excitement.

[479] Some time before this dream I had placed an order with an antiquarian bookseller abroad for one of the Latin alchemical classics, because I had come across a quotation that I thought might be connected with early Byzantine alchemy, and I wished to verify it. Several weeks after my dream a parcel arrived containing a parchment volume of the sixteenth century with many most fascinating symbolic pictures. They instantly reminded me of my dream library. As the rediscovery of alchemy forms an important part of my life as a pioneer of psychology, the motif of the unknown annex of my house can easily be understood as an anticipation of a new field of interest and research. At all events, from that moment thirty years ago the recurrent dream came to an end.

[480] Symbols, like dreams, are natural products, but they do not occur only in dreams. They can appear in any number of psychic manifestations: there are symbolic thoughts and feelings, symbolic acts and situations, and it often looks as if not only the unconscious but even inanimate objects were concurring in the arrangement of symbolic patterns. There are numerous well-authenticated stories of a clock that stopped at the moment of its owner's death, like Frederick the Great's pendulum clock at Sans Souci; of a mirror that broke, or a boiling coffee-pot that exploded, just before or during a crisis; and so on. Even if the sceptic refuses to credit such reports, stories of this kind are ever renewed and are told again and again, which is ample proof of their psychological importance, even though ignorant people deny their factual existence.

[481] The most important symbols, however, are not individual but collective in their nature and origin. They are found principally in the religions. The believer assumes that they are of divine origin—that they are revealed. The sceptic thinks they are invented. Both are wrong. It is true that, on the one hand, such symbols have for centuries been the objects of careful and quite conscious elaboration and differentiation, as in the case of dogmas. But, on the other hand, they are *représentations collectives* dating from dim and remote ages, and these are “revelations” only in the sense that they are images originating in dreams and creative fantasies. The latter are involuntary, spontaneous manifestations and by no means arbitrary and intentional inventions.

[482] There was never a genius who sat down with his pen or brush and said: “Now I am going to invent a symbol.” No one can take a more or less rational thought, reached as a logical conclusion or deliberately chosen, and then disguise it as a “symbolic” phantasmagoria. No matter how fantastic the trappings may look, it would still be a *sign* hinting at a conscious thought, and not a symbol. A sign is always less than the thing it points to, and a symbol is always more than we can understand at first sight. Therefore we never stop at the sign but go on to the goal it indicates; but we remain with the symbol because it promises more than it reveals.

[483] If the contents of dreams agree with a sex theory, then we know their essence already, but if they are symbolic we at least know that we do not understand them yet. *A symbol does not disguise, it reveals in time.* It is obvious that dream interpretation will yield one result when you consider the dream to be symbolic, and an entirely different one when you assume that the essential thought is merely disguised but already known in principle. In the latter case, dream interpretation makes no sense whatever, for you find only what you know already. Therefore I always advise my pupils: “Learn as much as you can about symbolism and forget it all when you are analysing a dream.” This advice is so important in practice that I myself have made it a rule to admit that I never understand a dream well enough to interpret it correctly. I do this in order to check the flow of my own associations and reactions, which might otherwise prevail over my patient’s uncertainties and hesitations. As it is of the highest therapeutic importance for the analyst to get the message of the dream as accurately as possible, it is essential for him to explore the context of the dream-images with the utmost thoroughness. I had a dream while I was working with Freud that illustrates this very clearly.

[484] I dreamt that I was in “my house,” apparently on the first floor, in a cosy, pleasant drawing-room furnished in the style of the eighteenth century. I was rather astonished because I realized I had never seen this room before, and began to wonder what the ground floor was like. I went downstairs and found it rather dark, with panelled walls and heavy furniture dating from the sixteenth century or even earlier. I was greatly

surprised and my curiosity increased, because it was all a very unexpected discovery. In order to become better acquainted with the whole structure of the house, I thought I would go down to the cellar. I found a door, with a flight of stone steps that led down to a large vaulted room. The floor consisted of large slabs of stone, and the walls struck me as very ancient. I examined the mortar and found it was mixed with splinters of brick. Obviously it was an old Roman wall. I began to grow excited. In a corner, I saw an iron ring in one of the stone slabs. I lifted it up and saw yet another narrow flight of steps leading down to a sort of cave which was obviously a prehistoric tomb. It contained two skulls, some bones, and broken shards of pottery. Then I woke up.

[485] If Freud, when analysing this dream, had followed my method of exploring the context, he would have heard a far-reaching story. But I am afraid he would have dismissed it as a mere attempt to escape from a problem that was really his own. The dream is in fact a short summary of my life—the life of my mind. I grew up in a house two hundred years old, our furniture consisted mostly of pieces about a hundred years old, and mentally my greatest adventure had been the study of Kant and Schopenhauer. The great news of the day was the work of Charles Darwin. Shortly before this I had been living in a still medieval world with my parents, where the world and man were still presided over by divine omnipotence and providence. This world had become antiquated and obsolete. My Christian faith had been relativized by my encounter with Eastern religions and Greek philosophy. It is for this reason that the ground floor was so still, dark, and obviously uninhabited.

[486] My then historical interests had developed from my original preoccupation with comparative anatomy and paleontology when I worked as an assistant at the Anatomical Institute. I was fascinated by the bones of fossil man, particularly by the much-discussed *Neanderthalensis* and the still more controversial skull of Dubois' *Pithecanthropus*. As a matter of fact, these were my real associations to the dream. But I did not dare mention the subject of skulls, skeletons, or corpses to Freud, because I had learned that this theme was not popular with him. He cherished the peculiar idea that I anticipated his early death. He drew this conclusion from the fact that I was interested in the mummified corpses in the so-called Bleikeller in Bremen, which we had visited together in 1909 on our trip to America.¹

[487] Thus I was reluctant to come out with my thoughts, since through recent experience I was deeply impressed by the almost unbridgeable gap between Freud's mental outlook and background and my own. I was afraid of losing his friendship if I should open up to him about my inner world, which, I surmised, would look very queer to him. Feeling quite uncertain about my own psychology, I almost automatically told him a lie about my "free associations" in order to escape the

impossible task of enlightening him about my very personal and utterly different mental constitution.

[488] I soon realized that Freud was seeking for some incompatible wish of mine. And so I suggested tentatively that the skulls might refer to certain members of my family whose death, for some reason, I might desire. This proposal met with his approval, but I was not satisfied with such a “phoney” solution.

[489] While I was trying to find a suitable answer to Freud’s questions, I was suddenly confounded by an intuition about the role which the subjective factor plays in psychological understanding. My intuition was so overwhelming that my only thought was how to get out of this impossible snarl, and I took the easy way out by a lie. This was neither elegant nor morally defensible, but otherwise I should have risked a fatal row with Freud—and I did not feel up to that for many reasons.

[490] My intuition consisted in a sudden and most unexpected insight into the fact that my dream meant myself, *my* life and *my* world, my whole reality as against a theoretical structure erected by another, alien mind for reasons and purposes of its own. It was not Freud’s dream, it was mine; and suddenly I understood in a flash what my dream meant.

[491] I must apologize for this rather lengthy narration of the jam I got into through telling Freud my dream. But it is a good example of the difficulties in which one gets involved in the course of a real dream analysis. So much depends on the personal differences between the analyst and the analysand.

[492] Dream analysis on this level is less a technique than a dialectical process between two personalities. If it is handled as a technique, the peculiarity of the subject as an individual is excluded and the therapeutic problem is reduced to the simple question: who will dominate whom? I had given up hypnotic treatment for this very reason, because I did not want to impose my will on others. I wanted the healing processes to grow out of the patient’s own personality, and not out of suggestions of mine that would have only a passing effect. I wanted to protect and preserve my patient’s dignity and freedom so that he could live his life by his own volition.

[493] I could not share Freud’s almost exclusive interest in sex. Assuredly sex plays no small role among human motives, but in many cases it is secondary to hunger, the power drive, ambition, fanaticism, envy, revenge, or the devouring passion of the creative impulse and the religious spirit.

[494] For the first time it dawned on me that before we construct general theories about man and his psyche we should learn a great deal more about the real human being, rather than an abstract idea of *Homo sapiens*.

4. THE PROBLEM OF TYPES IN DREAM INTERPRETATION

[495] In all other branches of science, it is a legitimate procedure to apply an hypothesis to an impersonal object. Psychology, however, inescapably confronts us with the living relationship between two individuals, neither of whom can be divested of his subjectivity or depersonalized in any way. They can mutually agree to deal with a chosen theme in an impersonal, objective manner, but when the whole of the personality becomes the object of their discussion, two individual subjects confront one another and the application of a one-way rule is excluded. Progress is possible only if mutual agreement can be reached. The objectivity of the final result can be established only by comparison with the standards that are generally valid in the social milieu to which the individuals belong, and we must also take their own mental equilibrium, or "sanity," into account. This does not mean that the final result must be the complete collectivization of the individual, for this would be a most unnatural condition. On the contrary, a sane and normal society is one in which people habitually disagree. General agreement is relatively rare outside the sphere of the instinctive qualities. Disagreement functions as a vehicle of mental life in a society, but it is not a goal; agreement is equally important. Because psychology basically depends upon balanced opposites, no judgment can be considered final unless allowance is made for its reversibility. The reason for this peculiarity lies in the fact that there is no standpoint above or outside psychology that would enable us to form a final judgment as to what the psyche is. Everything we can imagine is in a psychic state, i.e., in the state of a conscious representation. To get outside this is the whole difficulty of the physical sciences.

[496] In spite of the fact that the only reality is the individual, some generalities are necessary in order to clarify and classify the empirical material, for it would obviously be impossible to formulate any psychological theory, or to teach it, by describing individuals. As a principle of classification, one can choose any likeness or unlikeness if only it is general enough, be it anatomical, physiological, or psychological. For our purpose, which is mainly concerned with psychology, it will be a psychological one, namely the widespread and easily observable fact that a great number of people are *extraverted* and others *introverted*. There is no need for a special explanation of these terms as they have passed into common speech.

[497] This is one of the many generalities from which one can choose, and it is fairly suitable for our purpose in so far as we are seeking to describe the method of, and approach to, an understanding of dreams as the main source of natural symbols. As I

have said, the process of interpretation consists in the confrontation of two minds, the analyst's and the analysand's, and not in the application of a preconceived theory. The analyst's mind is characterized by a number of individual peculiarities, perhaps just as many as the analysand's. They have the effect of prejudices. It cannot be assumed that the analyst is a superman just because he is a doctor and possesses a theory and a corresponding technique. He can only imagine himself to be superior if he assumes that his theory and technique are absolute truths, capable of embracing the whole of the psyche. Since such an assumption is more than doubtful, he cannot really be sure of it. Consequently he will be assailed by secret doubts in adopting such an attitude, i.e., in confronting the human wholeness of the analysand with a theory and a technique (which are mere hypotheses) instead of with his own living wholeness. This alone is the equivalent of his analysand's personality. Psychological experience and knowledge are nothing more than professional advantages on the part of the analyst that do not keep him safely outside the fray. He will be tested just as much as the analysand.

[498] Since the systematic analysis of dreams demands the confrontation of two individuals, it will make a great difference whether their type of attitude is the same or not. If both belong to the same type, they may sail along happily for a long time. But if one is an extravert and the other an introvert, their different and contradictory standpoints may clash right away, particularly when they are unconscious of their own type or are convinced that it is the only right one. Such a mistake is easily made, because the value of the one is the non-value of the other. The one will choose the majority view, the other will reject it just because it is everybody's taste. Freud himself interpreted the introverted type as an individual morbidly engrossed in himself. But introspection and self-knowledge can just as well be of the greatest value.

[499] The apparently trifling difference between the extravert, with his emphasis on externals, and the introvert, who puts the emphasis on the way he takes a situation, plays a very great role in the analysis of dreams. From the start you must bear in mind that what the one appreciates may be very negative to the other, and the high ideal of the one can be an object of repulsion to the other. This becomes more and more obvious the further you go into the details of type differences. Extraversion and introversion are just two among many peculiarities of human behaviour, but they are often rather obvious and easily recognizable. If one studies extraverted individuals, for instance, one soon discovers that they differ from one another in many ways, and that being extraverted is a superficial and too general criterion to be really characteristic. That is why, long ago, I tried to find some further basic peculiarities that might serve the purpose of getting some order into the apparently limitless variations of human personality.

[500] I had always been impressed by the fact that there are surprisingly many individuals who never use their minds if they can avoid it, and yet are not stupid, and an equal number who obviously do use their minds but in an amazingly stupid way. I was also surprised to find many intelligent and wide-awake people who lived (as far as one could make out) as if they had never learned to use their sense organs. They did not see the things before their eyes, hear the words sounding in their ears, notice the things they touched or tasted, and lived without being aware of their own bodies. There were others who seemed to live in a most curious condition of consciousness, as if the state they had arrived at today were final, with no change in sight, or as if the world and the psyche were static and would remain so for ever. They seemed devoid of all imagination, and entirely and exclusively dependent on sense perception. Chances and possibilities did not exist in their world, and in their “today” there was no real “tomorrow.” The future was just the repetition of the past.

[501] What I am trying to convey to the reader is the first glimpse of the impressions I received when I began to observe the many people I met. It soon became clear to me that the people who used their minds were those who *thought*, who employed their intellectual faculty in trying to adapt to people and circumstances; and that the equally intelligent people, who yet did not think, were those who sought and found their way by *feeling*. Now “feeling” is a word that needs some explanation. For instance, one speaks of “feeling” when it is a matter of “sentiment” (corresponding to the French *sentiment*). But one also applies the same word to an opinion; a communication from the White House may begin: “The President feels ...” Or one uses it to express an intuition: “I had a feeling ...” Finally, feeling is often confused with sensation.

[502] What I mean by feeling in contrast to thinking is a *judgment of value*: agreeable or disagreeable, good or bad, and so on. Feeling so defined is not an emotion or affect, which is, as the words convey, an involuntary manifestation. Feeling as I mean it is a judgment without any of the obvious bodily reactions that characterize an emotion. Like thinking, it is a *rational* function; whereas intuition, like sensation, is *irrational*. In so far as intuition is a “hunch” it is not a product of a voluntary act; it is rather an involuntary event, which depends on different external or internal circumstances instead of an act of judgment. Intuition is more like sense perception, which is also an irrational event in so far as it depends essentially on external or internal stimuli deriving from physical and not mental causes.

[503] These four functional types correspond to the obvious means by which consciousness obtains its orientation. *Sensation* (or sense perception) tells you that something exists; *thinking* tells you what it is; *feeling* tells you whether it is agreeable or not; and *intuition* tells you where it comes from and where it is going.

[504] The reader should understand that these four criteria are just so many viewpoints among others, such as will-power, temperament, imagination, memory, morality, religiousness, etc. There is nothing dogmatic about them, nor do they claim to be the ultimate truth about psychology; but their basic nature recommends them as suitable principles of classification. Classification has little value if it does not provide a means of orientation and a practical terminology. I find classification into types particularly helpful when I am called upon to explain parents to children or husbands to wives, and vice versa. It is also useful in understanding one's own prejudices.

[505] Thus, if you want to understand another person's dream, you have to sacrifice your own predilections and suppress your prejudices, at least for the time being. This is neither easy nor comfortable, because it means a moral effort that is not everyone's cup of tea. But, if you do not make the effort to criticize your own standpoint and to admit its relativity, you will get neither the right information about, nor sufficient insight into, your analysand's mind. As you expect at least some willingness on his part to listen to your opinion and to take it seriously, the patient must be granted the same right too. Although such a relationship is indispensable for any understanding and is therefore a self-evident necessity, one has to remind oneself again and again that in therapy it is more important for the patient to understand than for the analyst's theoretical expectations to be satisfied. The patient's resistance to the analyst is not necessarily wrong; it is rather a sign that something does not "click." Either the patient is not yet at a point where he would be able to understand, or the interpretation does not fit.

[506] In our efforts to interpret the dream symbols of another person, we are particularly hampered by an almost invincible tendency to fill the gaps in our understanding by *projection*—that is, by the assumption that what I think is also my partner's thought. This source of error can be avoided by establishing the context of the dream-images and excluding all theoretical assumptions—except for the heuristic hypothesis that dreams somehow make sense.

[507] There is no rule, let alone a law, of dream interpretation, although it does look as if the general purpose of dreams is *compensation*. At least, compensation can be said to be the most promising and most fertile hypothesis. Sometimes the manifest dream demonstrates its compensatory character from the start. For instance, a patient with no small idea of himself and his moral superiority dreamt of a drunken tramp wallowing in a ditch beside the road. The dreamer says (in the dream): "It's awful to see how low a man can fall!" It is evident that the dream was attempting to deflate his exalted opinion of himself. But there was more to it than that. It turned out that he had a black sheep in the family, a younger brother who was a degenerate alcoholic. What the dream also revealed was that his superior attitude compensated the inferiority of his brother—and of the brother who was also himself.

[508] In another case, a lady who was proud of her intelligent understanding of psychology kept on dreaming about a certain woman whom she occasionally met in society. In real life she did not like her, thinking her vain, dishonest, and an intriguer. She wondered why she should dream of a person so unlike herself and yet, in the dream, so friendly and intimate, like a sister. The dream obviously wanted to convey the idea that she was “shadowed” by an unconscious character resembling that woman. As she had a very definite idea of herself, she was unaware of her own power-complex and her own shady motives, which had more than once led to disagreeable scenes that were always attributed to others but never to her own machinations.

[509] It is not only the shadow-side that is overlooked, disregarded and repressed; positive qualities can also be subjected to the same treatment. An instance of this would be an apparently modest, self-effacing man with winning, apologetic or deprecatory manners, who always takes a back seat though with seeming politeness he never misses an opportunity to be present. His judgment is well-informed, even competent and apparently appreciative, yet it hints at a certain higher level from which the matter in question could be dealt with in a far superior way. In his dreams he constantly meets great men such as Napoleon and Alexander the Great. His obvious inferiority complex is clearly compensated by such momentous visitors, but at the same time the dreams raise the critical question: what sort of man must I be to have such illustrious callers? In this respect, they show that the dreamer nurses a secret megalomania as an antidote to his inferiority complex. Without his knowing it, the idea of grandeur enables him to immunize himself against all influences from his surroundings; nothing penetrates his skin, and he can thus keep aloof from obligations that would be binding to other people. He does not feel in any way called upon to prove to himself or his fellows that his superior judgment is based on corresponding merits. He is not only a bachelor, but mentally sterile as well. He only understands the art of spreading hints and whisperings about his importance, but no monument witnesses to his deeds. He plays this inane game all unconsciously, and the dreams try to bring it home to him in a curiously ambiguous way, as the old saying goes: *Ducunt volentem fata, nolentem trahunt* (the fates lead the willing, but drag the unwilling). Hobnobbing with Napoleon or being on speaking terms with Alexander the Great is just the thing a man with an inferiority complex could wish for—a wholesale confirmation of the greatness behind the scenes. It is true wish-fulfilment, which anticipates an achievement without the merits that should lead to it. But why, one will ask, can't dreams be open and direct about it, and say it clearly without subterfuges that seem to mislead in an almost cunning way?

[510] I have frequently been asked this question and I have asked it myself. I am often surprised at the tantalizing way dreams seem to evade definite information or omit

the decisive point. Freud assumed the existence of a special factor, called the “censor,” which was supposed to twist the dream-images and make them unrecognizable or misleading in order to deceive the dreaming consciousness about the real subject of the dream: the incompatible wish. Through the concealment of the critical point, it was supposed that the dreamer’s sleep would be protected against the shock of a disagreeable reminiscence. But the dream as a guardian of sleep is an unlikely hypothesis, since dreams just as often disturb sleep.

[511] It looks rather as if, instead of an unconscious censor, consciousness, or the dreamer’s approach to consciousness, had itself a blotting-out effect on the subliminal contents. Subliminality corresponds to what Janet calls *abaissement du niveau mental*. It is a lowering of the energetic tension, in which psychic contents sink below the threshold and lose the qualities they possess in their conscious state. They lose their definiteness and clearness, and their relations become vaguely analogous instead of rational and comprehensible. This is a phenomenon that can be observed in all dreamlike conditions, whether due to fatigue, fever, or toxins. But as soon as their tension increases, they become less subliminal, more definite, and thus more conscious. There is no reason to believe that the *abaissement* shields incompatible wishes from discovery, although it may incidentally happen that an incompatible wish disappears along with the vanishing consciousness. The dream, being essentially a subliminal process, cannot produce a definite thought, unless it should cease to be a dream by instantly becoming a conscious content. The dream cannot but skip all those points that are particularly important to the conscious mind. It manifests the “fringe of consciousness,” like the faint glimmer of the stars during a total eclipse of the sun.

[512] Dream symbols are for the most part manifestations of a psyche that is beyond the control of consciousness. Meaning and purposefulness are not prerogatives of the conscious mind; they operate through the whole of living nature. There is no difference in principle between organic and psychic formations. As a plant produces its flower, so the psyche creates its symbols. Every dream is evidence of this process. Thus, through dreams, intuitions, impulses, and other spontaneous happenings, instinctive forces influence the activity of consciousness. Whether that influence is for better or worse depends on the actual contents of the unconscious. If it contains too many things that normally ought to be conscious, then its function becomes twisted and prejudiced; motives appear that are not based on true instincts, but owe their activity to the fact that they have been consigned to the unconscious by repression or neglect. They overlay, as it were, the normal unconscious psyche and distort its natural symbol-producing function.

[513] Therefore it is usual for psychotherapy, concerned as it is with the causes of a disturbance, to begin by eliciting from the patient a more or less voluntary confession

of all the things he dislikes, is ashamed of, or fears. This is like the much older confession in the Church, which in many ways anticipated modern psychological techniques. In practice, however, the procedure is often reversed, since overpowering feelings of inferiority or a serious weakness may make it very difficult, if not impossible, for the patient to face a still deeper darkness and worthlessness. I have often found it more profitable first to give a positive outlook to the patient, a foundation on which he could stand, before we approached more painful and debilitating insights.

[514] Take as a simple example the dream of “personal exaltation,” in which one has tea with the Queen of England, or is on intimate terms with the Pope. If the dreamer is not a schizophrenic, the practical interpretation of the symbol depends very much on the state of his consciousness. If he is obviously convinced of his greatness a damper will be indicated, but if it is a matter of a worm already crushed by the weight of his inferiority, a further lowering of his values would amount to cruelty. In the former case a reductive treatment will recommend itself, and it will be easy to show from the associative material how inappropriate and childish the dreamer’s intentions are, and how much they emanate from infantile wishes to be equal or superior to his parents. But in the latter case, where an all-pervading feeling of worthlessness has already devalued every positive aspect, to show the dreamer, on top of it all, how infantile, ridiculous, or even perverse he is would be quite unfitting. Such a procedure would only increase his inferiority, as well as cause an unwelcome and quite unnecessary resistance to the treatment.

[515] There is no therapeutic technique or doctrine that is generally applicable, since every case that comes for treatment is an individual in a specific condition. I remember a patient I had to treat over a period of nine years. I saw him only for a few weeks each year, as he lived abroad. From the start I knew what his real trouble was, but I also saw how the least attempt to get closer to the truth was met by a violent reaction and a self-defence that threatened complete rupture between us. Whether I liked it or not, I had to do my best to maintain the rapport and to follow his inclination, supported by his dreams, though this led the discussion away from the central problem that, according to all reasonable expectations, should have been discussed. It went so far that I often accused myself of leading my patient astray, and only the fact that his condition slowly but clearly improved prevented me from confronting him brutally with the truth.

[516] In the tenth year, however, the patient declared himself cured and freed from all symptoms. I was surprised and ready to doubt his statement, because theoretically he could not be cured. Noticing my astonishment, he smiled and said: “And now I want to thank you quite particularly for your unfailing tact and patience in helping me to circumvent the painful cause of my neurosis. I am now ready to tell you everything

about it. If I had been able to do so I would have told you right out at the first consultation. But that would have destroyed my rapport with you, and where would I have been then? I would have been morally bankrupt and would have lost the ground from under my feet, having nothing to stand on. In the course of the years I have learnt to trust you, and as my confidence grew my condition improved. I improved because my belief in myself was restored, and now I am strong enough to discuss the problem that was destroying me.”

[517] He then made a devastatingly frank confession, which showed me the reasons for the peculiar course our treatment had followed. The original shock had been such that he could not face it alone. It needed the two of us, and that was the therapeutic task, not the fulfilment of theoretical presuppositions.

[518] From cases like this I learnt to follow the lines already indicated in the material presented by the patient and in his disposition, rather than commit myself to general theoretical considerations that might not be applicable to that particular case. The practical knowledge of human nature I have accumulated in the course of sixty years has taught me to regard each case as a new experience, for which, first of all, I have to seek the individual approach. Sometimes I have not hesitated to plunge into a careful study of infantile events and fantasies; at other times I have begun at the top, even if this meant soaring into a mist of most unlikely metaphysical speculations. It all depends on whether I am able to learn the language of the patient and to follow the gropings of his unconscious towards the light. Some demand one thing and some another. Such are the differences between individuals.

[519] This is eminently true of the interpretation of symbols. Two different individuals can have almost the same dream, yet if one is young and the other old, the problems disturbing them will be correspondingly different, and it would be absurd to interpret both dreams in the same way. An example that comes to mind is a dream in which a company of young men are riding on horseback across a wide field. The dreamer is in the lead and jumps a ditch of water, just clearing it. The others fall into the ditch. The young man who told me this dream was a cautious, introverted type and rather afraid of adventure. But the old man, who also had this dream, was bold and fearless, and had lived an active and enterprising life. At the time of the dream, he was an invalid who would not settle down, gave much trouble to his doctor and nurse, and had injured himself by his disobedience and restlessness. Obviously the dream was telling the young man what he *ought* to do, and the old man what he was *still doing*. While it encouraged the hesitant young man, the old one would be only too glad to risk the jump. But that still-flickering spirit of adventure was just his greatest trouble.

[520] This example shows how the interpretation of dreams and symbols depends largely on the individual disposition of the dreamer. Symbols have not one meaning only but several, and often they even characterize a pair of opposites, as does, for

instance, the *stella matutina*, the morning star, which is a well-known symbol of Christ and at the same time of the devil (Lucifer). The same applies to the lion. The correct interpretation depends on the context, i.e., the associations connected with the image, and on the actual condition of the dreamer's mind.

5. THE ARCHETYPE IN DREAM SYMBOLISM

[521] The hypothesis we have advanced, that dreams serve the purpose of *compensation*, is a very broad and comprehensive assumption. It means that we believe the dream to be a normal psychic phenomenon that transmits unconscious reactions or spontaneous impulses to the conscious mind. Since only a small minority of dreams are manifestly compensatory, we must pay particular attention to the language of dreams that we consider to be symbolic. The study of this language is almost a science in itself. It has, as we have seen, an infinite variety of individual expressions. They can be read with the help of the dreamer, who himself provides the associative material, or context of the dream-image, so that we can look at all its aspects as if circumambulating it. This method proves to be sufficient in all ordinary cases, such as when a relative, a friend, or a patient tells you a dream more or less conversationally. But when it is a matter of outstanding dreams of obsessive or recurrent dreams, or dreams that are highly emotional, the personal associations produced by the dreamer no longer suffice for a satisfactory interpretation. In such cases, we have to take into consideration the fact, already observed and commented on by Freud, that elements often occur in a dream that are not individual and cannot be derived from personal experience. They are what Freud called “archaic remnants”—thought-forms whose presence cannot be explained by anything in the individual’s own life, but seem to be aboriginal, innate, and inherited patterns of the human mind.

[522] Just as the human body represents a whole museum of organs, with a long evolutionary history behind them, so we should expect the mind to be organized in a similar way rather than to be a product without history. By “history” I do not mean the fact that the mind builds itself up through conscious tradition (language, etc.), but rather its biological, prehistoric, and unconscious development beginning with archaic man, whose psyche was still similar to that of an animal. This immensely old psyche forms the basis of our mind, just as the structure of our body is erected upon a generally mammalian anatomy. Wherever the trained eye of the morphologist looks, it recognizes traces of the original pattern. Similarly, the experienced investigator of the psyche cannot help seeing the analogies between dream-images and the products of the primitive mind, its *représentations collectives*, or mythological motifs. But just as the morphologist needs the science of comparative anatomy, so the psychologist cannot do without a “comparative anatomy of the psyche.” He must have a sufficient experience of dreams and other products of the unconscious on the one hand, and on

the other of mythology in its widest sense. He cannot even see the analogy between a case of compulsion neurosis, schizophrenia, or hysteria and that of a classical demonic possession if he has not sufficient knowledge of both.

[523] My views about the “archaic remnants,” which I have called “archetypes”¹ or “primordial images,” are constantly criticized by people who lack a sufficient knowledge both of the psychology of dreams and of mythology. The term “archetype” is often misunderstood as meaning a certain definite mythological image or motif. But this would be no more than a conscious representation, and it would be absurd to assume that such variable representations could be inherited. The archetype is, on the contrary, an inherited *tendency of the human mind to form representations* of mythological motifs—representations that vary a great deal without losing their basic pattern. There are, for instance, numerous representations of the motif of the hostile brothers, but the motif remains the same. This inherited tendency is instinctive, like the specific impulse of nest-building, migration, etc. in birds. One finds these *représentations collectives* practically everywhere, characterized by the same or similar motifs. They cannot be assigned to any particular time or region or race. They are without known origin, and they can reproduce themselves even where transmission through migration must be ruled out.

[524] My critics have also incorrectly assumed that by archetypes I mean “inherited ideas,” and on this ground have dismissed the concept of the archetype as a mere superstition. But if archetypes were ideas that originated in our conscious mind or were acquired by it, one would certainly understand them, and would not be astonished and bewildered when they appear in consciousness. I can remember many cases of people who have consulted me because they were baffled by their own or their children’s dreams. The reason was that the dreams contained images that could not be traced to anything they remembered, and they could not explain where their children could have picked up such strange and incomprehensible ideas. These people were highly educated persons, sometimes psychiatrists themselves. One of them was a professor who had a sudden vision and thought he was crazy. He came to me in a state of complete panic. I simply took a four-hundred-year-old volume from the shelf and showed him an old woodcut that depicted his vision. “You don’t need to be crazy,” I told him. “They knew all about your vision four hundred years ago.” Whereupon he sat down entirely deflated but once more normal.

[525] I particularly remember the case of a man who was himself a psychiatrist. He brought me a handwritten booklet he had received as a Christmas present from his ten-year-old daughter. It contained a whole series of dreams she had had when she was eight years old. It was the weirdest series I had ever seen, and I could well understand why her father was more than puzzled by the dreams. Childlike though

they were, they were a bit uncanny, containing images whose origin was wholly incomprehensible to her father. Here are the salient motifs from the dreams:²

1. The “bad animal”: a snakelike monster with many horns, that kills and devours all other animals. But God comes from the four corners, being really four gods, and gives rebirth to all the animals.

2. Ascent into heaven where pagan dances are being celebrated, and descent to hell where angels are doing good deeds.

3. A horde of small animals frightens the dreamer. The animals grow to enormous size, and one of them devours her.

4. A small mouse is penetrated by worms, snakes, fishes, and human beings. Thus the mouse becomes human. This is the origin of mankind in four stages.

5. A drop of water is looked at through a microscope: it is full of branches. This is the origin of the world.

6. A bad boy with a clod of earth. He throws bits of it at the passers-by, and they all become bad too.

7. A drunken woman falls into the water and comes out sober and renewed.

8. In America many people are rolling in an ant heap, attacked by the ants. The dreamer, in a panic, falls into a river.

9. The dreamer is in a desert on the moon. She sinks so deep into the ground that she reaches hell.

10. She touches a luminous ball seen in a vision. Vapours come out of it. Then a man comes and kills her.

11. She is dangerously ill. Suddenly birds come out of her skin and cover her completely.

12. Swarms of gnats hide the sun, moon, and stars, all except one star which then falls on the dreamer.

[526] In the unabridged German original, each dream begins with the words of the fairytale: “Once upon a time ...” With these words the little dreamer suggests that she feels as if each dream were a sort of fairytale, which she wants to tell her father as a Christmas present. Her father was unable to elucidate the dreams through their context, for there seemed to be no personal associations. Indeed, this kind of childhood dream often seems to be a “Just So Story,” with very few or no spontaneous associations. The possibility that these dreams were conscious elaborations can of course be ruled out only by someone who had an intimate knowledge of the child’s character and did not doubt her truthfulness. They would, however, remain a challenge to our understanding even if they were fantasies that originated in the waking state. The father was convinced that they were authentic, and I have no reason to doubt it. I knew the little girl myself, but this was before she

gave the dreams to her father, and I had no chance to question her about them, for she lived far away from Switzerland and died of an infectious disease about a year after that Christmas.

[527] The dreams have a decidedly peculiar character, for their leading thoughts are in a way like philosophical problems. The first dream, for instance, speaks of an evil monster killing all other animals, but God gives rebirth to them through a kind of *apocatastasis*, or restitution. In the Western world this idea is known through Christian tradition. It can be found in the Acts of the Apostles 3:21: “(Christ,) whom the heaven must receive until the times of restitution of all things ...” The early Greek Fathers of the Church (Origen, for instance) particularly insisted on the idea that, at the end of time, everything will be restored by the Redeemer to its original and perfect state. According to Matthew 17:11, there was already an old Jewish tradition that Elias “truly shall first come, and restore all things.” I Corinthians 15:22 refers to the same idea in the following words: “For as in Adam all die, even so in Christ shall all be made alive.”

[528] One might argue that the child had met with this thought in her religious education. But she had had very little of this, as her parents (Protestants) belonged to those people, common enough in our days, who know the Bible only from hearsay. It is particularly unlikely that the idea of *apocatastasis* had been explained to her, and had become a matter of vital interest. Her father, at any rate, was entirely unaware of this mythical idea.

[529] Nine of the twelve dreams are concerned with the theme of destruction and restoration. We find the same connection in I Corinthians 15:22, where Adam and Christ; i.e., death and resurrection, are linked together. None of these dreams, however, shows anything more than superficial traces of a specifically Christian education or influence. On the contrary, they show more analogy with primitive tales. This is corroborated by the other motif—the cosmogonic myth of the creation of the world and of man, which appears in dreams 4 and 5.

[530] The idea of Christ the Redeemer belongs to the world-wide and pre-Christian motif of the hero and rescuer who, although devoured by the monster, appears again in a miraculous way, having overcome the dragon or whale or whatever it was that swallowed him. How, when, and where such a motif originated nobody knows. We do not even know how to set about investigating the problem in a sound way. Our only certainty is that every generation, so far as we can see, has found it as an old tradition. Thus we can safely assume that the motif “originated” at a time when man did not yet know that he possessed a hero myth—in an age, therefore, when he did not yet reflect consciously on what he was saying. The hero figure is a typical image, an archetype, which has existed since time immemorial.

[531] The best examples of the spontaneous production of archetypal images are presented by individuals, particularly children, who live in a milieu where one can be sufficiently certain that any direct knowledge of the tradition is out of the question. The milieu in which our little dreamer lived was acquainted only with the Christian tradition, and very superficially at that. Christian traces may be represented in her dreams by such ideas as God, angels, heaven, hell, and evil, but the way in which they are treated points to a tradition that is entirely non-Christian.

[532] Let us take the first dream, of the God who really consists of four gods, coming from the “four corners.” The corners of what? There is no room mentioned in the dream. A room would not even fit in with the picture of what is obviously a cosmic event, in which the Universal Being himself intervenes. The quaternity itself is a strange idea, but one that plays a great role in Eastern religions and philosophies. In the Christian tradition it has been superseded by the Trinity, a notion that we must assume was known to the child. But who in an ordinary middleclass milieu would be likely to know of a divine quaternity? It is an idea that was once current in circles acquainted with Hermetic philosophy in the Middle Ages, but it petered out at the beginning of the eighteenth century and has been entirely obsolete for at least two hundred years. Where, then, did the little girl pick it up? From Ezekiel’s vision? But there is no Christian teaching that identifies the seraphim with God.

[533] The same question may be asked about the horned serpent. In the Bible, it is true, there are many horned animals, for instance in the Book of Revelation (ch. 13). But they seem to be quadrupeds, although their overlord is the dragon, which in Greek (*drakon*) means serpent. The horned serpent appears in Latin alchemy as the *quadricornutus serpens* (four-horned serpent), a symbol of Mercurius and an antagonist of the Christian Trinity. But this is an obscure reference, and, as far as I can discover, it occurs only in one author.³

[534] In dream 2 a motif appears that is definitely non-Christian and a reversal of values: pagan dances by men in heaven and good deeds by angels in hell. This suggests, if anything, a relativization of moral values. Where did the child hit on such a revolutionary and modern idea, worthy of Nietzsche’s genius? Such an idea is not strange to the philosophical mind of the East, but where could we find it in the child’s milieu, and what is its place in the mind of an eight-year-old girl?

[535] This question leads to a further one: what is the compensatory meaning of the dreams, to which the little girl obviously attributed so much importance that she gave them to her father as a Christmas present?

[536] If the dreamer had been a primitive medicine-man, one would not go far wrong in supposing them to be variations on the philosophical themes of death, resurrection, or restitution, the origin of the world, the creation of man, and the relativity of values (Lao-tze: “high stands on low”). One might well give up such dreams as hopeless if

one tried to interpret them from a personal standpoint. But, as I have said, they undoubtedly contain *représentations collectives*, and they are in a way analogous to the doctrines taught to young people in primitive tribes when they are initiated into manhood. At such times they learn about what God or the gods or the “founding” animals have done, how the world and man were created, what the end of the world will be, and the meaning of death. And when do we, in our Christian civilization, hand out similar instructions? At the beginning of adolescence. But many people begin to think of these things again in old age, at the approach of death.

[537] Our dreamer, as it happened, was in both these situations, for she was approaching puberty and at the same time the end of her life. Little or nothing in the symbolism of the dreams points to the beginning of a normal adult life, but there are many allusions to destruction and restoration. When I first read the dreams, I had the uncanny feeling that they foreboded disaster. The reason I felt like that was the peculiar nature of the compensation that I deduced from the symbolism. It was the opposite of what one would expect to find in the consciousness of a girl of that age. These dreams open up a new and rather terrifying vision of life and death, such as one might expect in someone who looks back upon life rather than forward to its natural continuation. Their atmosphere recalls the old Roman saying, *vita somnium breve* (life is a short dream), rather than the joy and exuberance of life’s springtime. For this child, life was a *ver sacrum vovendum*, a vow of a vernal sacrifice. Experience shows that the unknown approach of death casts an *adumbratio*, an anticipatory shadow, over the life and dreams of the victim. Even the altar in our Christian churches represents, on the one hand, a tomb, and on the other a place of resurrection—the transformation of death into eternal life.

[538] Such are the thoughts that the dreams brought home to the child. They were a preparation for death, expressed through short stories, like the instruction at primitive initiations, or the *koans* of Zen Buddhism. It is an instruction that does not resemble the orthodox Christian doctrine but is more like primitive thought. It seems to have originated outside the historical tradition, in the matrix that, since prehistoric times, has nourished philosophical and religious speculations about life and death.

[539] In the case of this girl, it was as if future events were casting their shadow ahead by arousing thought-forms that, though normally dormant, are destined to describe or accompany the approach of a fatal issue. They are to be found everywhere and at all times. Although the concrete shape in which they express themselves is more or less personal, their general pattern is collective, just as animal instincts vary a good deal in different species and yet serve the same general purpose. We do not assume that each newborn animal creates its own instincts as an individual acquisition, and we cannot suppose, either, that human beings invent and produce their specifically human modes of reaction with every new birth. Like the instincts, the collective

thought-patterns of the human mind are innate and inherited; and they function, when occasion arises, in more or less the same way in all of us.

[540] Emotional manifestations are based on similar patterns, and are recognizably the same all over the earth. We understand them even in animals, and the animals themselves understand each other in this respect, even if they belong to different species. And what about insects, with their complicated symbiotic functions? Most of them do not even know their parents and have nobody to teach them. Why should we suppose, then, that man is the only living creature deprived of specific instincts, or that his psyche is devoid of all traces of its evolution? Naturally, if you identify the psyche with consciousness, you can easily succumb to the erroneous idea that the psyche is a *tabula rasa*, completely empty at birth, and that it later contains only what it has learnt by individual experience. But the psyche is more than consciousness. Animals have little consciousness, but they have many impulses and reactions that denote the existence of a psyche, and primitives do a lot of things whose meaning is unknown to them. You may ask many civilized people in vain for the reason and meaning of the Christmas tree or of the coloured eggs at Easter, because they have no idea about the meaning of these customs. The fact is, they do things without knowing why they do them. I am inclined to believe that things were generally done first and that only a long time afterwards somebody asked a question about them, and then eventually discovered why they were done. The medical psychologist is constantly confronted with otherwise intelligent patients who behave in a peculiar way and have no inkling of what they say or do. We have dreams whose meaning escapes us entirely, even though we may be firmly convinced that the dream has a definite meaning. We feel it is important or even terrifying, but why?

[541] Regular observation of such facts has enforced the hypothesis of an unconscious psyche, the contents of which seem to be of approximately the same variety as those of consciousness. We know that consciousness depends in large measure on the collaboration of the unconscious. When you make a speech, the next sentence is being prepared while you speak, but this preparation is mostly unconscious. If the unconscious does not collaborate and withholds the next sentence you are stuck. You want to quote a name, or a term otherwise familiar to you, but nothing is forthcoming. The unconscious does not deliver it. You want to introduce somebody whom you know well, but his name has vanished, as if you had never known it. Thus you depend on the goodwill of your unconscious. Any time the unconscious chooses, it can defeat your otherwise good memory, or put something into your mouth that you did not intend at all. It can produce unpredictable and unreasonable moods and affects and thus cause all sorts of complications.

[542] Superficially, such reactions and impulses seem to be of an intimately personal nature and are therefore believed to be entirely individual. In reality, they are based

on a preformed and ever-ready instinctive system with its own characteristic and universally understandable thought-forms, reflexes, attitudes, and gestures. These follow a pattern that was laid down long before there was any trace of a reflective consciousness. It is even conceivable that the latter originated in violent emotional clashes and their often disastrous consequences. Take the case of the savage who, in a moment of anger and disappointment at having caught no fish, strangles his much beloved only son, and is then seized with immeasurable regret as he holds the little dead body in his arms. Such a man has a great chance to remember the agony of this moment for ever. This could have been the beginning of a reflective consciousness. At all events, the shock of a similar emotional experience is often needed to make people wake up and pay attention to what they are doing. I would mention the famous case of the Spanish hidalgo, Ramón Lull, who after a long chase finally succeeded in meeting his lady at a secret rendezvous. Silently she opened her garment and showed him her cancer-eaten bosom. The shock changed his life: he became a holy man.

[543] Often in the case of these sudden transformations one can prove that an archetype has been at work for a long time in the unconscious, skilfully arranging circumstances that will unavoidably lead to a crisis. It is not rare for the development to manifest itself so clearly (for instance in a series of dreams) that the catastrophe can be predicted with reasonable certainty. One can conclude from experiences such as these that archetypal forms are not just static patterns, but dynamic factors that manifest themselves in spontaneous impulses, just as instincts do. Certain dreams, visions, or thoughts can suddenly appear, and in spite of careful investigation one cannot find out what causes them. This does not mean that they have no cause; they certainly have, but it is so remote or obscure that one cannot see what it is. One must wait until the dream and its meaning are sufficiently understood, or until some external event occurs that will explain the dream.

[544] Our conscious thoughts often concern themselves with the future and its possibilities, and so does the unconscious and its dreams. There has long been a world-wide belief that the chief function of dreams is prognostication of the future. In antiquity, and still in the Middle Ages, dreams played their part in medical prognosis. I can confirm from a modern dream the prognosis, or rather precognition, in an old dream quoted by Artemidoros of Daldis, in the second century A.D. He relates that a man dreamt he saw his father die in the flames of a house on fire. Not long afterwards, he himself died of a *phlegmone* (fire, high fever), presumably pneumonia. Now it so happened that a colleague of mine was suffering from a deadly gangrenous fever—in fact, a *phlegmone*. A former patient of his, who had no knowledge of the nature of the doctor's illness, dreamt that the doctor was perishing in a great fire. The dream occurred three weeks before the doctor died, at a time when he had just

entered hospital and the disease was only at its beginning. The dreamer knew nothing but the bare fact that the doctor was ill and had entered hospital.

[545] As this example shows, dreams can have an anticipatory or prognostic aspect, and their interpreter will be well advised to take this aspect into account, particularly when an obviously meaningful dream does not yield a context sufficient to explain it. Such a dream often comes right out of the blue, and one wonders what could have prompted it. Of course, if one knew its ultimate outcome, the cause would be clear. It is only our conscious mind that does not know; the unconscious seems already informed, and to have submitted the case to a careful prognostic examination, more or less in the way consciousness would have done if it had known the relevant facts. But, precisely because they were subliminal, they could be perceived by the unconscious and submitted to a sort of examination that anticipates their ultimate result. So far as one can make out from dreams, the unconscious in its “deliberations” proceeds in an instinctive way rather than along rational lines. The latter way is the prerogative of consciousness, which selects with reason and knowledge. But the unconscious is guided chiefly by instinctive trends, represented by corresponding thought-forms—the archetypes. It looks as if it were a poet who had been at work rather than a rational doctor, who would speak of infection, fever, toxins, etc., whereas the dream describes the diseased body as a man’s earthly house, and the fever as the heat of a conflagration that is destroying the house and its inhabitant.

[546] As this dream shows, the archetypal mind has handled the situation in the same way as it did at the time of Artemidoros. A situation of a more or less unknown nature has been intuitively grasped by the unconscious and submitted to an archetypal treatment. This shows clearly that, in place of the *raisonnement* which consciousness would have applied, the archetypal mind has autonomously taken over the task of prognostication. The archetypes have their own initiative and their own specific energy, which enable them not only to produce a meaningful interpretation (in their own style) but also to intervene in a given situation with their own impulses and thought-forms. In this respect they function like complexes, which also enjoy a certain autonomy in everyday life. They come and go very much as they please, and they often interfere with our conscious intentions in an embarrassing way.

[547] One can perceive the specific energy of the archetypes when one experiences the peculiar feeling of numinosity that accompanies them—the fascination or spell that emanates from them. This is also characteristic of the personal complexes, whose behaviour may be compared with the role played by the archetypal *représentations collectives* in the social life of all times. As personal complexes have their individual history, so do social complexes of an archetypal character. But while personal complexes never produce more than a personal bias, archetypes create myths, religions, and philosophical ideas that influence and set their stamp on whole nations

and epochs. And just as the products of personal complexes can be understood as compensations of onesided or faulty attitudes of consciousness, so myths of a religious nature can be interpreted as a sort of mental therapy for the sufferings of mankind, such as hunger, war, disease, old age, and death.

[548] The universal hero myth, for example, shows the picture of a powerful man or god-man who vanquishes evil in the form of dragons, serpents, monsters, demons, and enemies of all kinds, and who liberates his people from destruction and death. The narration or ritual repetition of sacred texts and ceremonies, and the worship of such a figure with dances, music, hymns, prayers, and sacrifices, grip the audience with numinous emotions and exalt the participants to identification with the hero. If we contemplate such a situation with the eyes of a believer, we can understand how the ordinary man is gripped, freed from his impotence and misery, and raised to an almost superhuman status, at least for the time being, and often enough he is sustained by such a conviction for a long time. An initiation of this kind produces a lasting impression, and may even create an attitude that gives a certain form and style to the life of a society. I would mention as an example the Eleusinian mysteries, which were finally suppressed at the beginning of the seventh century. They formed, together with the Delphic oracle, the essence and spirit of ancient Greece. On a much greater scale the Christian era owes its name and significance to another antique mystery, that of the god-man, which has its roots in the archetypal Osiris-Horus myth of ancient Egypt.

[549] It is nowadays a common prejudice to assume that once, in an obscure prehistoric time, the basic mythological ideas were “invented” by a clever old philosopher or prophet, and ever afterwards “believed” by credulous and uncritical people, although the stories told by a power-seeking priesthood were not really “true” but mere “wishful thinking.” The word “invent” is derived from the Latin *invenire* and means, in the first place, to “come upon” or to “find” something and, in the second, to find something by *seeking* for it. In the latter case, it is not a matter of finding or coming upon something by mere chance, for there is a sort of foreknowledge or a faint inkling of the thing you are going to find.

[550] When we contemplate the strange ideas in the dreams of the little girl, it seems unlikely that she *sought* them, as she was rather surprised at finding them. They occurred to her rather as strange and unexpected stories that seemed noteworthy and interesting enough to be given to her father as a Christmas present. In doing so, she lifted them up into the sphere of our still living Christian mystery, the birth of our Lord, blended with the secret of the evergreen tree that carries the newborn Light. Although there is ample historical evidence for the symbolic relationship between Christ and the tree symbol, the little girl’s parents would have been badly embarrassed had they been asked to explain exactly what they meant by decorating a

tree with burning candles to celebrate the nativity of Christ. “Oh, it’s just a Christmas custom!” they would have said. A serious answer would require a far-reaching dissertation on the symbolism of the dying god in antiquity, in the Near East, and its relation to the cult of the Great Mother and her symbol, the tree—to mention only one aspect of this complicated problem.

[551] The further we delve into the origins of a *représentation collective* or, in ecclesiastical language, of a dogma, the more we uncover a seemingly limitless web of archetypal patterns that, before modern times, were never the object of conscious reflection. Thus, paradoxically enough, we know more about mythological symbolism than did any age before our own. The fact is that in former times men *lived* their symbols rather than reflected upon them. I will illustrate this by an experience I once had with the primitives on Mount Elgon in East Africa. Every morning at dawn they leave their huts and breathe or spit into their hands, stretching them out to the first rays of the sun, as if they were offering either their breath or their spittle to the rising god—to *mungu*. (This Swahili word, which they used in explaining the ritual act, is derived from a Polynesian root equivalent to *mana* or *mulungu*. These and similar terms designate a “power” of extraordinary efficacy, an all-pervading essence which we would call divine. Thus the word *mungu* is their equivalent for Allah or God.) When I asked them what they meant by this act and why they did it, they were completely baffled. They could only say: “We have always done it. It has always been done when the sun rises.” They laughed at the obvious conclusion that the sun is *mungu*. The sun is not *mungu* when it is above the horizon; *mungu* is the actual moment of the sunrise.

[552] What they were doing was obvious to me but not to them. They just do it, they never reflect on what they are doing, and are consequently unable to explain themselves. They are evidently just repeating what they have “always” done at sunrise, no doubt with a certain emotion and by no means merely mechanically, for they *live* it while we *reflect* on it. Thus I knew that they were offering their *souls* to *mungu*, because the breath (of life) and the spittle mean “soul substance.” Breathing or spitting on something conveys a “magical” effect, as, for instance, when Christ used spittle to heal the blind, or when a son inhales his dying father’s last breath in order to take over the father’s soul. It is most unlikely that these primitives ever, even in the remote past, knew any more about the meaning of their ceremony. On the contrary, their ancestors probably knew even less, because they were more profoundly unconscious and thought if possible even less about their doings.

[553] Faust aptly says: “Im Anfang war die Tat” (in the beginning was the deed). Deeds were never invented, they were done. Thoughts, on the other hand, are a relatively late discovery; they were found, and then they were sought and found. Yet unreflected life existed long before man; it was not invented, but in it man found

himself as an afterthought. First he was moved to deeds by unconscious factors, and only a long time afterwards did he begin to reflect about the causes that had moved him; then it took him a very long time indeed to arrive at the preposterous idea that he must have moved himself—his mind being unable to see any other motivating force than his own. We would laugh at the idea of a plant or an animal inventing itself, yet there are many people who believe that the psyche or the mind invented itself and thus brought itself into being. As a matter of fact, the mind has grown to its present state of consciousness as an acorn grows into an oak or as saurians developed into mammals. As it has been, so it is still, and thus we are moved by forces from within as well as from without.

[554] In a mythological age these forces were called *mana*, spirits, demons, and gods, and they are as active today as they ever were. If they conform to our wishes, we call them happy hunches or impulses and pat ourselves on the back for being smart fellows. If they go against us, then we say it is just bad luck, or that certain people have it in for us, or it must be pathological. The one thing we refuse to admit is that we are dependent on “powers” beyond our control.

[555] It is true that civilized man has acquired a certain amount of will-power which he can apply where he pleases. We have learnt to do our work efficiently without having recourse to chanting and drumming to hypnotize us into the state of doing. We can even dispense with the daily prayer for divine aid. We can carry out what we propose to do, and it seems self-evident that an idea can be translated into action without a hitch, whereas the primitive is hampered at every step by doubts, fears, and superstitions. The motto “Where there’s a will there’s a way” is not just a Germanic prejudice; it is the superstition of modern man in general. In order to maintain his credo, he cultivates a remarkable lack of introspection. He is blind to the fact that, with all his rationality and efficiency, he is possessed by powers beyond his control. The gods and demons have not disappeared at all, they have merely got new names. They keep him on the run with restlessness, vague apprehensions, psychological complications, an invincible need for pills, alcohol, tobacco, dietary and other hygienic systems—and above, all, with an impressive array of neuroses.

[556] I once met a drastic example of this in a professor of philosophy and “psychology”—a psychology in which the unconscious had not yet arrived. He was the man I mentioned who was obsessed by the idea that he had cancer, although X-rays had proved to him that it was all imaginary. Who or what caused this idea? It obviously derived from a fear that was not caused by observation of the facts. It suddenly overcame him and then remained. Symptoms of this kind are extraordinarily obstinate and often enough hinder the patient from getting the proper treatment. For what good would psychotherapy be in dealing with a malignant tumour? Such a dangerous thing could only be operated on without delay. To the

professor's ever-renewed relief, every new authority assured him that there was no trace of cancer. But the very next day the doubt began nagging again, and he was plunged once more into the night of unmitigated fear.

[557] The morbid thought had a power of its own that he could not control. It was not foreseen in his philosophical brand of psychology, where everything flowed neatly from consciousness and sense-perception. The professor admitted that his case was pathological, but there his thinking stopped, because it had arrived at the sacrosanct border-line between the philosophical and the medical faculty. The one deals with normal and the other with abnormal contents, unknown in the philosopher's world.

[558] This compartment psychology reminds me of another case. It was that of an alcoholic who had come under the laudable influence of a certain religious movement and, fascinated by its enthusiasm, had forgotten he needed a drink. He was obviously and miraculously cured by Jesus, and accordingly was held up as a witness to divine grace or to the efficacy of the said organization. After a few weeks of public confession, the novelty began to wear off and some alcoholic refreshment seemed to be indicated. But this time the helpful organization came to the conclusion that the case was "pathological" and not suitable for an intervention by Jesus. So they put him in a clinic to let the doctor do better than the divine healer.

[559] This is an aspect of the modern "cultural" mind that is well worth looking into. It shows an alarming degree of dissociation and psychological confusion. We believe exclusively in consciousness and free will, and are no longer aware of the powers that control us to an indefinite degree, outside the narrow domain where we can be reasonable and exercise a certain amount of free choice and self-control. In our time of general disorientation, it is necessary to know about the true state of human affairs, which depends so much on the mental and moral qualities of the individual and on the human psyche in general. But if we are to see things in their right perspective, we need to understand the past of man as well as his present. That is why a correct understanding of myths and symbols is of essential importance.

6. THE FUNCTION OF RELIGIOUS SYMBOLS

[560] Although our civilized consciousness has separated itself from the instincts, the instincts have not disappeared: they have merely lost their contact with consciousness. They are thus forced to assert themselves in an indirect way, through what Janet called automatisms. These take the form of symptoms in the case of a neurosis or, in normal cases, of incidents of various kinds, like unaccountable moods, unexpected forgetfulness, mistakes in speech, and so on. Such manifestations show very clearly the *autonomy* of the archetypes. It is easy to believe that one is master in one's own house, but as long as we are unable to control our emotions and moods, or to be conscious of the myriad secret ways in which unconscious factors insinuate themselves into our arrangements and decisions, we are certainly not the masters. On the contrary, we have so much reason for uncertainty that it will be better to look twice at what we are doing.

[561] The exploration of one's conscience, however, is not a popular pastime, although it would be most necessary, particularly in our time when man is threatened with self-created and deadly dangers that are growing beyond his control. If, for a moment, we look at mankind as one individual, we see that it is like a man carried away by unconscious powers. He is dissociated like a neurotic, with the Iron Curtain marking the line of division. Western man, representing the kind of consciousness hitherto regarded as valid, has become increasingly aware of the aggressive will to power of the East, and he sees himself forced to take extraordinary measures of defence. What he fails to see is that it is his own vices, publicly repudiated and covered up by good international manners, that are thrown back in his face through their shameless and methodical application by the East. What the West has tolerated, but only secretly, and indulged in a bit shamefacedly (the diplomatic lie, the double-cross, veiled threats), comes back openly and in full measure and gets us tied up in knots—exactly the case of the neurotic! It is the face of our own shadow that glowers at us across the Iron Curtain.

[562] This state of affairs explains the peculiar feeling of helplessness that is creeping over our Western consciousness. We are beginning to realize that the conflict is in reality a moral and mental problem, and we are trying to find some answer to it. We grow increasingly aware that the nuclear deterrent is a desperate and undesirable answer, as it cuts both ways. We know that moral and mental remedies would be more effective because they could provide us with a psychic immunity to the ever-increasing infection. But all our attempts have proved to be singularly ineffectual,

and will continue to do so as long as we try to convince ourselves and the world that it is only *they*, our opponents, who are all wrong, morally and philosophically. We expect *them* to see and understand where they are wrong, instead of making a serious effort ourselves to recognize our own shadow and its nefarious doings. If we could only see our shadow, we should be immune to any moral and mental infection and insinuation. But as long as this is not so, we lay ourselves open to every infection because we are doing practically the same things as *they* are, only with the additional disadvantage that we neither see nor want to understand what we are doing under the cloak of good manners.

[563] The East has one big myth—which we call an illusion in the vain hope that our superior judgment will make it disappear. This myth is the time-hallowed archetypal dream of a Golden Age or a paradise on earth, where everything is provided for everybody, and one great, just, and wise Chief rules over a human kindergarten. This powerful archetype in its infantile form has got them all right, but it won't disappear from the world at the mere sight of our superior point of view. We even support it by our own childishness, for our Western civilization is in the grip of the same mythology. We cherish the same prejudices, hopes, and expectations. We believe in the Welfare State, in universal peace, in more or less equality for man, in his eternal human rights, injustice and truth, and (not too loud) in the Kingdom of God on earth.

[564] The sad truth is that man's real life consists of inexorable opposites—day and night, wellbeing and suffering, birth and death, good and evil. We are not even sure that the one will prevail against the other, that good will overcome evil, or joy defeat pain. Life and the world are a battleground, have always been and always will be, and, if it were not so, existence would soon come to an end. It is for this reason that a superior religion like Christianity expected an early end to this world, and Buddhism actually puts an end to it by turning its back on all desires. These categorical answers would be frankly suicidal if they were not bound up with the peculiar moral ideas and practices that constitute the body of both religions.

[565] I mention this because in our time there are countless people who have lost faith in one or other of the world religions. They do not understand them any longer. While life runs smoothly, the loss remains as good as unnoticed. But when suffering comes, things change very rapidly. One seeks the way out and begins to reflect about the meaning of life and its bewildering experiences. It is significant that, according to the statistics, the psychiatrist is consulted more by Protestants and Jews than by Catholics. This might be expected, for the Catholic Church still feels responsible for the *cura animarum*, the care of souls. But in this scientific age, the psychiatrist is apt to be asked questions that once belonged to the domain of the theologian. People feel that it makes, or would make, a great difference if only they had a positive belief in a meaningful way of life or in God and immortality. The spectre of death looming up

before them often gives a powerful incentive to such thoughts. From time immemorial, men have had ideas about a Supreme Being (one or several) and about the Land of the Hereafter. Only modern man thinks he can do without them. Because he cannot discover God's throne in heaven with a telescope or radar, or establish for certain that dear father or mother are still about in a more or less corporeal form, he assumes that such ideas are not "true." I would rather say that they are not "true" enough. They have accompanied human life since prehistoric times and are still ready to break through into consciousness at the slightest provocation.

[566] One even regrets the loss of such convictions. Since it is a matter of invisible and unknowable things (God is beyond human understanding, and immortality cannot be proved), why should we bother about evidence or truth? Suppose we did not know and understand the need for salt in our food, we would nevertheless profit from its use. Even if we should assume that salt is an illusion of our taste-buds, or a superstition, it would still contribute to our wellbeing. Why, then, should we deprive ourselves of views that prove helpful in crises and give a meaning to our existence? And how do we know that such ideas are not true? Many people would agree with me if I stated flatly that such ideas are illusions. What they fail to realize is that this denial amounts to a "belief" and is just as impossible to prove as a religious assertion. We are entirely free to choose our standpoint; it will in any case be an arbitrary decision. There is, however, a strong empirical reason why we should hold beliefs that we know can never be proved. It is that they are known to be useful. Man positively needs general ideas and convictions that will give a meaning to his life and enable him to find his place in the universe. He can stand the most incredible hardships when he is convinced that they make sense; but he is crushed when, on top of all his misfortunes, he has to admit that he is taking part in a "tale told by an idiot."

[567] It is the purpose and endeavour of religious symbols to give a meaning to the life of man. The Pueblo Indians believe that they are the sons of Father Sun, and this belief gives their life a perspective and a goal beyond their individual and limited existence. It leaves ample room for the unfolding of their personality, and is infinitely more satisfactory than the certainty that one is and will remain the underdog in a department store. If St. Paul had been convinced that he was nothing but a wandering weaver of carpets, he would certainly not have been himself. His real and meaningful life lay in the certainty that he was the messenger of the Lord. You can accuse him of megalomania, but your opinion pales before the testimony of history and the *consensus omnium*. The myth that took possession of him made him something greater than a mere craftsman.

[568] Myths, however, consist of symbols that were not invented but happened. It was not the man Jesus who created the myth of the God-man; it had existed many

centuries before. He himself was seized by this symbolic idea, which, as St. Mark tells us, lifted him out of the carpenter's shop and the mental narrowness of his surroundings. Myths go back to primitive story-tellers and their dreams, to men moved by the stirrings of their fantasies, who were not very different from poets and philosophers in later times. Primitive story-tellers never worried about the origin of their fantasies; it was only much later that people began to wonder where the story came from. Already in ancient Greece they were advanced enough to surmise that the stories about the gods were nothing but old and exaggerated traditions of ancient kings and their deeds. They assumed even then that the myth did not mean what it said because it was obviously improbable. Therefore they tried to reduce it to a generally understandable yarn. This is exactly what our time has tried to do with dream symbolism: it is assumed that it does not mean what it seems to say, but something that is generally known and understood, though not openly admitted because of its inferior quality. For those who had got rid of their conventional blinkers there were no longer any riddles. It seemed certain that dreams meant something different from what they said.

[569] This assumption is wholly arbitrary. The Talmud says more aptly: "The dream is its own interpretation." Why should dreams mean something different from what appears in them? Is there anything in nature that is other than what it is? For instance, the duck-billed platypus, that original monster which no zoologist would ever have invented, is it not just what it is? The dream is a normal and natural phenomenon, which is certainly just what it is and does not mean something it is not. We call its contents symbolic because they have obviously not only one meaning, but point in different directions and must therefore mean something that is unconscious, or at least not conscious in all its aspects.

[570] To the scientific mind, such phenomena as symbolic ideas are most irritating, because they cannot be formulated in a way that satisfies our intellect and logic. They are by no means the only instance of this in psychology. The trouble begins already with the phenomenon of affect or emotion, which evades all the attempts of the psychologist to pin it down in a hard-and-fast concept. The cause of the difficulty is the same in both cases—the intervention of the unconscious. I know enough of the scientific standpoint to understand that it is most annoying to have to deal with facts that cannot be grasped completely or at any rate adequately. The trouble with both phenomena is that the facts are undeniable and yet cannot be formulated in intellectual terms. Instead of observable details with clearly discernible features, it is life itself that wells up in emotions and symbolic ideas. In many cases emotion and symbol are actually one and the same thing. There is no intellectual formula capable of representing such a complex phenomenon in a satisfactory way.

[571] The academic psychologist is perfectly free to dismiss the emotions or the unconscious, or both, from his consideration. Yet they remain facts to which at least the medical psychologist has to pay ample attention, for emotional conflicts and the interventions of the unconscious are the classical features of his science. If he treats a patient at all, he is confronted with irrationalities of this kind whether he can formulate them intellectually or not. He has to acknowledge their only too troublesome existence. It is therefore quite natural that people who have not had the medical psychologist's experience find it difficult to follow what he is talking about. Anyone who has not had the chance, or the misfortune, to live through the same or similar experiences is hardly capable of understanding what happens when psychology ceases to be a tranquil pursuit for the scientist in his laboratory and becomes a real life adventure. Target practice on a shooting range is far from being a battlefield, but the doctor has to deal with casualties in a real war. Therefore he has to concern himself with psychic realities even if he cannot define them in scientific terms. He can name them, but he knows that all the terms he uses to designate the essentials of life do not pretend to be more than names for facts that have to be experienced in themselves, because they cannot be reproduced by their names. No textbook can teach psychology; one learns only by actual experience. No understanding is gained by memorizing words, for symbols are the living facts of life.

[572] The cross in the Christian religion, for instance, is a meaningful symbol that expresses a multitude of aspects, ideas, and emotions, but a cross before somebody's name simply indicates that that individual is dead. The *lingam* or phallus functions as an all-embracing symbol in the Hindu religion, but if a street urchin draws one on a wall, it just means an interest in his penis. Because infantile and adolescent fantasies often continue far into adult life, many dreams contain unmistakable sexual allusions. It would be absurd to understand them as anything else. But when a mason speaks of monks and nuns to be laid upon each other, or a locksmith of male and female keys, it would be nonsensical to suppose that he is indulging in glowing adolescent fantasies. He simply means a particular kind of tile or key that has been given a colourful name. But when an educated Hindu talks to you about the *lingam*, you will hear things we Westerners would never connect with the penis. You may even find it most difficult to guess what he actually means by this term, and you will naturally conclude that the *lingam symbolizes* a good many things. It is certainly not an obscene allusion; nor is the cross a mere sign for death but a symbol for a great many other ideas. Much, therefore, depends on the maturity of the dreamer who produces such an image.

[573] The interpretation of dreams and symbols requires some intelligence. It cannot be mechanized and crammed into stupid and unimaginative brains. It demands an ever-

increasing knowledge of the dreamer's individuality as well as an ever-increasing self-awareness on the part of the interpreter. No experienced worker in this field will deny that there are rules of thumb that can prove helpful, but they must be applied with prudence and intelligence. Not everybody can master the "technique." You may follow all the right rules and the apparently safe path of knowledge and yet you get stuck in the most appalling nonsense, simply by overlooking a seemingly unimportant detail that a better intelligence would not have missed. Even a man with a highly developed intellect can go badly astray because he has never learnt to use his intuition or his feeling, which might be at a regrettably low level of development.

[574] The attempt to understand symbols does not only bring you up against the symbol itself, but up against the wholeness of the symbol-producing individual. If one is really up to this challenge, one may meet with success. But as a rule it will be necessary to make a special study of the individual and his or her cultural background. One can learn a lot in this way and so get a chance to fill in the gaps in one's education. I have made it a rule myself to consider every case an entirely new proposition about which I do not even know the ABC. Routine may be and often is practical, and quite useful as long as one skates on the surface, but as soon as one gets in touch with the vital problems, life itself takes over and even the most brilliant theoretical premises become ineffectual words.

[575] This makes the teaching of methods and techniques a major problem. As I have said, the pupil has to acquire a good deal of specialized knowledge. This provides him with the necessary mental tool-shop, but the main thing, the handling of the tools, can be acquired only if the pupil undergoes an analysis that acquaints him with his own conflict. This can be quite a task with some so-called normal but unimaginative individuals. They are just incapable of realizing, for instance, the simple fact that psychic events happen to us spontaneously. Such people prefer to cling to the idea that whatever occurs either is done by themselves or else is pathological and must be cured by pills or injections. They show how close dull normality is to a neurosis, and as a matter of fact such people succumb most easily to psychic epidemics.

[576] In all the higher grades of science, imagination and intuition play an increasingly important role over and above intellect and its capacity for application. Even physics, the most rigorous of all the applied sciences, depends to an astonishing degree on intuition, which works by way of the unconscious processes and not by logical deductions, although it is possible to demonstrate afterwards what logical procedure might have led to the same result.

[577] Intuition is almost indispensable in the interpretation of symbols, and can cause an immediate acceptance on the part of the dreamer. But, subjectively convincing as such a lucky hunch may be, it is also somewhat dangerous, because it leads to a false

sense of security. It may even seduce both the interpreter and the dreamer into continuing this rather facile exchange of ideas, which may end in a sort of mutual dream. The secure basis of real intellectual and moral knowledge gets lost if one is satisfied with a vague feeling of having understood. Usually when one asks people the reasons for their so-called understanding, they are unable to give an explanation. One can understand and explain only when one has brought intuitions down to the safe basis of real knowledge of the facts and their logical connections. An honest investigator will have to admit that this is not possible in certain cases, but it would be dishonest of him to dismiss them on that account. Even a scientist is a human being, and it is quite natural that he, like others, hates the things he cannot explain and thus falls victim to the common illusion that what we know today represents the highest summit of knowledge. Nothing is more vulnerable and ephemeral than scientific theories, which are mere tools and not everlasting truths.

7. HEALING THE SPLIT

[578] When the medical psychologist takes an interest in symbols, he is primarily concerned with “natural” symbols as distinct from “cultural” symbols. The former are derived from the unconscious contents of the psyche, and they therefore represent an enormous number of variations on the basic archetypal motifs. In many cases, they can be traced back to their archaic roots, i.e., to ideas and images that we meet in the most ancient records and in primitive societies. In this respect, I should like to call the reader’s attention to such books as Mircea Eliade’s study of shamanism,¹ where a great many illuminating examples may be found.

[579] “Cultural” symbols, on the other hand, are those that have expressed “eternal truths” or are still in use in many religions. They have gone through many transformations and even a process of more or less conscious elaboration, and in this way have become the *représentations collectives* of civilized societies. Nevertheless, they have retained much of their original numinosity, and they function as positive or negative “prejudices” with which the psychologist has to reckon very seriously.

[580] Nobody can dismiss these numinous factors on merely rational grounds. They are important constituents of our mental make-up and vital forces in the building up of human society, and they cannot be eradicated without serious loss. When they are repressed or neglected, their specific energy disappears into the unconscious with unpredictable consequences. The energy that appears to have been lost revives and intensifies whatever is uppermost in the unconscious—tendencies, perhaps, that have hitherto had no chance to express themselves, or have not been allowed an uninhibited existence in our consciousness. They form an ever-present destructive “shadow.” Even tendencies that might be able to exert a beneficial influence turn into veritable demons when they are repressed. This is why many well-meaning people are understandably afraid of the unconscious, and incidentally of psychology.

[581] Our times have demonstrated what it means when the gates of the psychic underworld are thrown open. Things whose enormity nobody could have imagined in the idyllic innocence of the first decade of our century have happened and have turned the world upside down. Ever since, the world has remained in a state of schizophrenia. Not only has the great civilized Germany disgorged its primitivity, but Russia also is ruled by it, and Africa has been set on fire. No wonder the Western world feels uneasy, for it does not know how much it plays into the hands of the uproarious underworld and what it has lost through the destruction of its numinosities. It has lost its moral and spiritual values to a very dangerous degree. Its

moral and spiritual tradition has collapsed, and has left a worldwide disorientation and dissociation.

[582] We could have seen long ago from primitive societies what the loss of numinosity means: they lose their *raison d'être*, the order of their social organizations, and then they dissolve and decay. We are now in the same condition. We have lost something we have never properly understood. Our spiritual leaders cannot be spared the blame for having been more interested in protecting their institutions than in understanding the mystery that symbols present. Faith does not exclude thought (which is man's strongest weapon), but unfortunately many believers are so afraid of science, and also of psychology, that they turn a blind eye to the numinous psychic powers that forever control man's fate. We have stripped all things of their mystery and numinosity; nothing is holy any longer.

[583] The masses and their leaders do not realize that it makes no substantial difference whether you call the world principle male and a father (spirit), or female and a mother (matter). Essentially, we know as little of the one as of the other. Since the beginning of the human mind, both were numinous symbols, and their importance lay in their numinosity and not in their sex or other chance attributes. Since energy never vanishes, the emotional energy that manifests itself in all numinous phenomena does not cease to exist when it disappears from consciousness. As I have said, it reappears in unconscious manifestations, in symbolic happenings that compensate the disturbances of the conscious psyche. Our psyche is profoundly disturbed by the loss of moral and spiritual values that have hitherto kept our life in order. Our consciousness is no longer capable of integrating the natural afflux of concomitant, instinctive events that sustains our conscious psychic activity. This process can no longer take place in the same way as before, because our consciousness has deprived itself of the organs by which the auxiliary contributions of the instincts and the unconscious could be assimilated. These organs were the numinous symbols, held holy by common consent.

[584] A concept like "physical matter," stripped of its numinous connotation of the "Great Mother," no longer expresses the vast emotional meaning of "Mother Earth." It is a mere intellectual term, dry as dust and entirely inhuman. In the same way, "spirit" identified with "intellect" ceases to be the Father of All. It degenerates into the limited mind of man, and the immense emotional energy expressed in the image "our Father" vanishes in the sand of an intellectual desert.

[585] Through scientific understanding, our world has become dehumanized. Man feels himself isolated in the cosmos. He is no longer involved in nature and has lost his emotional participation in natural events, which hitherto had a symbolic meaning for him. Thunder is no longer the voice of a god, nor is lightning his avenging missile. No river contains a spirit, no tree means a man's life, no snake is the embodiment of

wisdom, and no mountain still harbours a great demon. Neither do things speak to him nor can he speak to things, like stones, springs, plants, and animals. He no longer has a bush-soul identifying him with a wild animal. His immediate communication with nature is gone for ever, and the emotional energy it generated has sunk into the unconscious.

[586] This enormous loss is compensated by the symbols in our dreams. They bring up our original nature, its instincts and its peculiar thinking. Unfortunately, one would say, they also express their contents in the language of nature, which is strange and incomprehensible to us. It sets us the task of translating its images into the rational words and concepts of modern speech, which has liberated itself from its primitive encumbrances—notably from its mystical participation with things. Nowadays, talking of ghosts and other numinous figures is no longer the same as conjuring them up. We have ceased to believe in magical formulas; not many taboos and similar restrictions are left; and our world seems to be disinfected of all such superstitious numina as “witches, warlocks, and worricows,” to say nothing of werewolves, vampires, bush-souls, and all the other bizarre beings that populate the primeval forest.

[587] At least the surface of our world seems to be purified of all superstitious and irrational admixtures. Whether, however, the real inner world of man—and not our wish-fulfilling fiction about it—is also freed from primitivity is another question. Is not the number 13 still taboo for many people? Are there not still many individuals possessed by funny prejudices, projections, and illusions? A realistic picture of the human mind reveals many primitive traits and survivals, which are still playing their roles just as if nothing had happened during the last five hundred years. The man of today is a curious mixture of characteristics acquired over the long ages of his mental development. This is the man and his symbols we have to deal with, and we must scrutinize his mental products very carefully indeed. Sceptical viewpoints and scientific convictions exist in him side by side with old-fashioned prejudices, outdated habits of thought and feeling, obstinate misinterpretations, and blind ignorance.

[588] Such are the people who produce the symbols we are investigating in their dreams. In order to explain the symbols and their meaning, it is essential to learn whether these representations are still the same as they ever were, or whether they have been chosen by the dream for its particular purpose from a store of general conscious knowledge. If, for instance, one has to deal with a dream in which the number 13 occurs, the question is: Does the dreamer habitually believe in the unfavourable nature of the number, or does the dream merely allude to people who still indulge in such superstitions? The answer will make a great difference to the interpretation. In the former case, the dreamer is still under the spell of the unlucky

13, and will therefore feel most uncomfortable in room no. 13 or sitting at a table with thirteen people. In the latter case, 13 may not be more than a chiding or disparaging remark. In one case it is a still numinous representation; in the other it is stripped of its original emotionality and has assumed the innocuous character of a mere piece of indifferent information.

[589] This illustrates the way in which archetypes appear in practical experience. In the first case they appear in their original form—they are images and at the same time emotions. One can speak of an archetype only when these two aspects coincide. When there is only an image, it is merely a word-picture, like a corpuscle with no electric charge. It is then of little consequence, just a word and nothing more. But if the image is charged with numinosity, that is, with psychic energy, then it becomes dynamic and will produce consequences. It is a great mistake in practice to treat an archetype as if it were a mere name, word, or concept. It is far more than that: it is a piece of life, an image connected with the living individual by the bridge of emotion. The word alone is a mere abstraction, an exchangeable coin in intellectual commerce. But the archetype is living matter. It is not limitlessly exchangeable but always belongs to the economy of a living individual, from which it cannot be detached and used arbitrarily for different ends. It cannot be explained in just any way, but only in the one that is indicated by that particular individual. Thus the symbol of the cross, in the case of a good Christian, can be interpreted only in the Christian way unless the dream produces very strong reasons to the contrary, and even then the specifically Christian meaning should not be lost sight of.

[590] The mere use of words is futile if you do not know what they stand for. This is particularly true in psychology, where we speak of archetypes like the anima and animus, the wise old man, the great mother, and so on. You can know about all the saints, sages, prophets, and other godly men, and all the great mothers of the world, but if they are mere images whose numinosity you have never experienced, it will be as if you were talking in a dream, for you do not know what you are talking about. The words you use are empty and valueless, and they gain life and meaning only when you try to learn about their numinosity, their relationship to the living individual. Then only do you begin to understand that the names mean very little, but that the way they are related to you is all-important.

[591] The symbol-producing function of our dreams is an attempt to bring our original mind back to consciousness, where it has never been before, and where it has never undergone critical self-reflection. We *have been* that mind, but we have never *known* it. We got rid of it before understanding it. It rose from its cradle, shedding its primitive characteristics like cumbersome and valueless husks. It looks as if the unconscious represented the deposit of these remnants. Dreams and their symbols continually refer to them, as if they intended to bring back all the old primitive things

from which the mind freed itself in the course of its evolution: illusions, childish fantasies, archaic thought-forms, primitive instincts. This is in reality the case, and it explains the resistance, even fear and horror, one experiences in approaching the unconscious. One is shocked less by the primitivity of its contents than by their emotionality. They are not merely neutral or indifferent, they are so charged with affect that they are often exceedingly uncomfortable. They can even cause real panic, and the more they are repressed the more they spread through the whole personality in the form of a neurosis.

[592] It is just their emotionality, however, that gives them such a vital importance. It is as if a man who has lived through a period of life in an unconscious state should suddenly realize that there is a gap in his memory—that important events seem to have taken place that he cannot remember. In so far as he assumes that the psyche is an exclusively personal affair (and this is the usual assumption), he will try to retrieve the apparently lost infantile memories. But the gaps in his childhood memories are merely the symptoms of a much greater loss, the loss of the primitive psyche—the psyche that lived and functioned before it was reflected by consciousness.

[593] As the evolution of the embryonic body repeats its prehistory, so the mind grows up through the series of its prehistoric stages. Dreams seem to consider it their main task to bring back a sort of recollection of the prehistoric as well as the infantile world, right down to the level of the most primitive instincts, as if such memories were a priceless treasure. And these memories can indeed have a remarkably healing effect in certain cases, as Freud saw long ago. This observation confirms the view that an infantile memory-gap (a so-called amnesia) amounts to a definite loss and that its recovery brings an increase in vitality and well-being. Since we measure a child's psychic life by the paucity and simplicity of its conscious contents, we do not appreciate the far-reaching complexities of the infantile mind that stem from its original identity with the prehistoric psyche. That "original mind" is just as much present and still functioning in the child as the evolutionary stages are in the embryo. If the reader remembers what I said earlier about the child who made a present of her dreams to her father, he will get a good idea of what I mean.

[594] In infantile amnesia, one finds strange admixtures of mythological fragments that also often appear in later psychoses. Images of this kind are highly numinous and therefore very important. If such recollections reappear in adult life, they may in some cases cause profound psychological disturbances, while in other people they can produce astonishing cures or religious conversions. Often they bring back a piece of life, missing for a long time, that enriches the life of an individual.

[595] The recollection of infantile memories and the reproduction of archetypal modes of psychic functioning create a wider horizon and a greater extension of consciousness, provided that one succeeds in assimilating and integrating the lost and

regained contents. Since they are not neutral, their assimilation will modify the personality, even as they themselves will have to undergo certain alterations. In this part of the individuation process the interpretation of symbols plays an important practical role; for the symbols are natural attempts to reconcile and reunite often widely separated opposites, as is apparent from the contradictory nature of many symbols. It would be a particularly obnoxious error in this work of assimilation if the interpreter were to take only the conscious memories as “true” or “real,” while considering the archetypal contents as merely fantastic representations. Dreams and their ambiguous symbols owe their forms on the one hand to repressed contents and on the other to archetypes. They thus have two aspects and enable one to interpret in two ways: one lays the emphasis either on their personal or on their archetypal aspect. The former shows the morbid influence of repression and infantile wishes, while the latter points to the sound instinctive basis. However fantastic the archetypal contents may be, they represent emotional powers or “numinosities.” If one should try to brush them aside, they would only get repressed and would create the same neurotic condition as before. Their numinosity gives the contents an autonomous nature. This is a psychological fact that cannot be denied. If it is nevertheless denied, the regained contents are annihilated and any attempt at a synthesis is futile. But it appears to be a tempting way out and therefore it is often chosen.

[596] Not only is the existence of archetypes denied, but even those people who do admit their existence usually treat them as if they were mere images and forget that they are living entities that make up a great part of the human psyche. As soon as the interpreter strips them of their numinosity, they lose their life and become mere words. It is then easy enough to link them together with other mythological representations, and so the process of limitless substitution begins; one glides from archetype to archetype, everything means everything, and one has reduced the whole process to absurdity. All the corpses in the world are chemically identical, but living individuals are not. It is true that the forms of archetypes are to a considerable extent interchangeable, but their numinosity is and remains a fact. It represents the *value* of an archetypal event. This emotional value must be kept in mind and allowed for throughout the whole intellectual process of interpretation. The risk of losing it is great, because thinking and feeling are so diametrically opposed that thinking abolishes feeling-values and vice versa. Psychology is the only science that has to take the factor of value (feeling) into account, since it forms the link between psychic events on the one hand, and meaning and life on the other.

[597] Our intellect has created a new world that dominates nature, and has populated it with monstrous machines. The latter are so indubitably useful and so much needed that we cannot see even a possibility of getting rid of them or of our odious subservience to them. Man is bound to follow the exploits of his scientific and

inventive mind and to admire himself for his splendid achievements. At the same time, he cannot help admitting that his genius shows an uncanny tendency to invent things that become more and more dangerous, because they represent better and better means for wholesale suicide. In view of the rapidly increasing avalanche of world population, we have already begun to seek ways and means of keeping the rising flood at bay. But nature may anticipate all our attempts by turning against man his own creative mind, and, by releasing the H-bomb or some equally catastrophic device, put an effective stop to overpopulation. In spite of our proud domination of nature we are still her victims as much as ever and have not even learnt to control our own nature, which slowly and inevitably courts disaster.

[598] There are no longer any gods whom we can invoke to help us. The great religions of the world suffer from increasing anaemia, because the helpful numina have fled from the woods, rivers, mountains, and animals, and the God-men have disappeared underground into the unconscious. There we suppose they lead an ignominious existence among the relics of our past, while we remain dominated by the great *Déesse Raison*, who is our overwhelming illusion. With her aid we are doing laudable things: we rid the world of malaria, we spread hygiene everywhere, with the result that under-developed populations increase at such a rate that food is becoming a problem. “We have conquered nature” is a mere slogan. In reality we are confronted with anxious questions, the answers to which seem nowhere in sight. The so-called conquest of nature overwhelms us with the natural fact of over-population and makes our troubles more or less unmanageable because of our psychological incapacity to reach the necessary political agreements. It remains quite natural for men to quarrel and fight and struggle for superiority over one another. Where indeed have we “conquered nature”?

[599] As any change must begin somewhere, it is the single individual who will undergo it and carry it through. The change must begin with one individual; it might be any one of us. Nobody can afford to look around and to wait for somebody else to do what he is loath to do himself. As nobody knows what he could do, he might be bold enough to ask himself whether by any chance his unconscious might know something helpful, when there is no satisfactory conscious answer anywhere in sight. Man today is painfully aware of the fact that neither his great religions nor his various philosophies seem to provide him with those powerful ideas that would give him the certainty and security he needs in face of the present condition of the world.

[600] I know that the Buddhists would say, as indeed they do: if only people would follow the noble eightfold path of the Dharma (doctrine, law) and had true insight into the Self; or the Christians: if only people had the right faith in the Lord; or the rationalists: if only people could be intelligent and reasonable—then all problems would be manageable and solvable. The trouble is that none of them manages to

solve these problems himself. Christians often ask why God does not speak to them, as he is believed to have done in former days. When I hear such questions, it always makes me think of the Rabbi who was asked how it could be that God often showed himself to people in the olden days but that nowadays one no longer saw him. The Rabbi replied: “Nor is there anyone nowadays who could stoop so low.”

[601] This answer hits the nail on the head. We are so captivated by and entangled in our subjective consciousness that we have simply forgotten the age-old fact that God speaks chiefly through dreams and visions. The Buddhist discards the world of unconscious fantasies as “distractions” and useless illusions; the Christian puts his Church and his Bible between himself and his unconscious; and the rationalist intellectual does not yet know that his consciousness is not his total psyche, in spite of the fact that for more than seventy years the unconscious has been a basic scientific concept that is indispensable to any serious student of psychology.

[602] We can no longer afford to be so God-almighty as to set ourselves up as judges of the merits or demerits of natural phenomena. We do not base our botany on a division into useful and useless plants, or our zoology on a classification into harmless and dangerous animals. But we still go on blithely assuming that consciousness is sense and the unconscious is nonsense—as if you could make out whether any natural phenomenon makes sense or not! Do microbes, for instance, make sense or nonsense? Such evaluations merely demonstrate the lamentable state of our mind, which conceals its ignorance and incompetence under the cloak of megalomania. Certainly microbes are very small and most despicable, but it would be folly to know nothing about them.

[603] Whatever else the unconscious may be, it is a natural phenomenon that produces symbols, and these symbols prove to be meaningful. We cannot expect someone who has never looked through a microscope to be an authority on microbes; in the same way, no one who has not made a serious study of natural symbols can be considered a competent judge in this matter. But the general undervaluation of the human psyche is so great that neither the great religions nor the philosophies nor scientific rationalism have been willing to look at it twice. In spite of the fact that the Catholic Church admits the occurrence of dreams sent by God, most of its thinkers make no attempt to understand them. I also doubt whether there is a Protestant treatise on dogmatics that would “stoop so low” as to consider the possibility that the *vox Dei* might be perceived in a dream. But if somebody really believes in God, by what authority does he suggest that God is unable to speak through dreams?

[604] I have spent more than half a century investigating natural symbols, and I have come to the conclusion that dreams and their symbols are not stupid and meaningless. On the contrary, dreams provide you with the most interesting information if only you take the trouble to understand their symbols. The results, it is true, have little to

do with such worldly concerns as buying and selling. But the meaning of life is not exhaustively explained by your business activities, nor is the deep desire of the human heart answered by your bank account, even if you have never heard of anything else.

[605] At a time when all available energy is spent in the investigation of nature, very little attention is paid to the essence of man, which is his psyche, although many researches are made into its conscious functions. But the really unknown part, which produces symbols, is still virtually unexplored. We receive signals from it every night, yet deciphering these communications seems to be such an odious task that very few people in the whole civilized world can be bothered with it. Man's greatest instrument, his psyche, is little thought of, if not actually mistrusted and despised. "It's only psychological" too often means: It is nothing.

[606] Where, exactly, does this immense prejudice come from? We have obviously been so busy with the question of what we think that we entirely forget what the unconscious psyche thinks about us. Freud made a serious attempt to show why the unconscious deserves no better judgment, and his teachings have inadvertently increased and confirmed the existing contempt for the psyche. Before him it had been merely overlooked and neglected; now it has become a dump for moral refuse and a source of fear.

[607] This modern standpoint is surely onesided and unjust. It does not even accord with the known facts. Our actual knowledge of the unconscious shows it to be a natural phenomenon, and that, like nature herself, it is at least *neutral*. It contains all aspects of human nature—light and dark, beautiful and ugly, good and evil, profound and silly. The study of individual as well as collective symbolism is an enormous task, and one that has not yet been mastered. But at last a beginning has been made. The results so far gained are encouraging, and they seem to indicate an answer to many of the questions perplexing present-day mankind.

III

THE SYMBOLIC LIFE

[A seminar talk given on 5 April 1939 to the Guild of Pastoral Psychology, London. Issued privately, as a transcript from shorthand notes by Derek Kitchin, as Guild Lecture No. 80 (London, 1954). Jung had approved the transcript. Subsequently published, in abbreviated form, in *Darshana* (Moradabad, India), 1:3 (August 1961), 11–22; the issue was dedicated to the memory of C. G. Jung, who had died on 6 June of that year. The Guild Lecture is reproduced here with stylistic revisions.]

THE SYMBOLIC LIFE

Professor Jung was asked two questions:

First, had he any views on what was likely to be the next step in religious development? Did he, for example, think that there would be a new revelation—as some would phrase it, a new incarnation of the World Teacher, a new collective fantasy? Or was there likely to be a reinterpretation and new appreciation of the esoteric meaning of Christianity—perhaps with the aid of psychology? Or would there be no collective expression, but a period in which each man had to make his own individual contact and live out his own personal expression?

Secondly, would he explain why the believing Catholic was not subject to neurosis, and what could be done by the Protestant churches to counteract the tendency of their members to neurotic conditions?

[608] I am not as ambitious as the questions that have been put to me! I should like to start with the second question, about the Roman Catholics, which has not been considered as of primary importance, but which, from a technical point of view, deserves full attention.

[609] You have heard that I said Roman Catholics are less threatened by neurosis than members of other religious confessions. Of course there are Catholic neurotics just as well as others, but it is a fact that in my forty years of experience I have had no more than six practising Catholics among my patients. Naturally I do not count all those who *have been* Catholics, or who say that they are Catholics but who do not practise; but of practising Catholics I have had not more than about six. That is also the experience of my colleagues. In Zurich we are surrounded by Catholic cantons; not quite two-thirds of Switzerland is Protestant and the rest is Catholic. And then we have on the frontier Southern Germany, which is Catholic. So we should have a fair number of Catholic patients, but we have not; we have very few.

[610] I was once asked by students of divinity a very interesting question: whether in my view people in modern times, in case of psychological trouble, would go to the doctor rather than to the parson or the priest? Now, I said I could not answer that question, but I would enquire. So I sent round a questionnaire with detailed questions. I did not do it myself, because if I ask something, of course that is already a prejudice, and every answer would be prejudiced. So I gave the questionnaire to certain people who were not known to be acquainted with me, or in any kind of

relation to me, and they sent it around, and we got hundreds of very interesting answers. And there I found the confirmation of what I already knew, namely, a large percentage—by far the majority—of Catholics said that, in case of psychological trouble, they would go to the priest and not to the doctor. The vast majority of Protestants said they would naturally go to the doctor. I had a very large number of answers from members of families of parsons, and they nearly all said that they would not go to the parson, they would rather go to the doctor. (I can talk quite freely about this. I am the son of a parson, and my grandfather was a sort of bishop, and I had five uncles all parsons, so I know something about the job! I have no hostile attitude to the clergy. On the contrary; but this is a fact.) I also had answers from Jews, and not one single Jew said he would go to the Rabbi—he wouldn't even think of it. And I had one Chinese, who gave me a classical answer. He said: "When I am young I go to the doctor, and when I am old I go to the philosopher."

[611] I also had answers from representatives of the clergy, and I must mention one answer, which I hope is not in any way representative, but which casts a certain light upon a certain kind of theologian. The writer said, "Theology has nothing to do with the practical man." What has it to do with, then? You could say, "With God"; but you are not going to tell me that theology deals with God in that sense. Theology is really meant for man, if it is meant for anything. God needs no theology, I should say. That [answer] is a symptom of a certain attitude which explains a lot.

[612] Now, I have spoken of my own experience in this field, but recently statistical researches have been made in America about the very same question, but from another angle. It is a sort of appreciation of the amount of complexes, or complex manifestations, you find in people. You find the least or the smallest number of complex manifestations in practising Catholics, far more in Protestants, and the most in Jews. That is absolutely independent of my own researches; a colleague of mine in the United States made these researches,¹ and that bears out what I have told you.

[613] So there must be something in the Catholic Church which accounts for this peculiar fact. Of course, we think in the first place of confession. That is only the outer aspect. I happen to know a great deal about confession, because I have often had to do with the Catholic clergy, particularly with Jesuits, who were busy in psychotherapy. For many years the Catholic clergy have studied psychotherapy; they have followed it up very closely. In the first place it was, of course, the Jesuits who studied it, and now recently I have heard that the Benedictines have done so too. There is an old tradition in the Catholic Church of the *directeur de conscience*—a sort of leader of souls. These directors have an extraordinary amount of experience and training in that work, and I have often been amazed at the wisdom with which Jesuits and other Catholic priests advised their patients.

[614] Just recently it happened that a patient of mine, a woman of the nobility, who had a Jesuit father-confessor, discussed with him all the critical points of the analysis she made under my care. Of course, a number of things were not quite orthodox, and I was fully aware that there was a great conflict in her mind, and I advised her to discuss these matters with her father-confessor. (He was a famous Jesuit—he is now dead.) And then, after she had had that very frank talk, she told me all he said to her, and he had confirmed every word I had told her—a thing that was rather amazing to me, particularly from the mouth of a Jesuit. That opened my eyes to the extraordinary wisdom and culture of the Catholic *directeur de conscience*. And it explains to a certain extent why the practising Catholic would rather go to the priest.

[615] The fact is that there are relatively few neurotic Catholics, and yet they are living under the same conditions as we do. They are presumably suffering from the same social conditions and so on, and so one would expect a similar amount of neurosis. There must be something in the cult, in the actual religious practice, which explains that peculiar fact that there are fewer complexes, or that these complexes manifest themselves much less in Catholics than in other people. That something, besides confession, is really the cult itself. It is the Mass, for instance. The heart of the Mass contains a living mystery, and that is the thing that works. When I say “a living mystery,” I mean nothing mysterious; I mean mystery in that sense which the word has always had—a *mysterium tremendum*.² And the Mass is by no means the only mystery in the Catholic Church. There are other mysteries too. They begin with the very preparations, the simple things, in the Church. Take, for instance, the preparation of the baptismal water—the rite of the *benedictio fontis major*, or *minor*, on the night of the Sabbath before Easter. There you can see that a part of the Eleusinian Mysteries is still performed.

[616] If you ask the average priest, he is unable to give you any account of these things. He does not know them. I once asked the Bishop of Fribourg, in Switzerland, to send us a man who could give a good account of the mystery of the Mass. It was a sad failure; he could tell us nothing. He could only confess to the wonderful impression, the marvellous mystical feeling, but he could say nothing at all as to why he had that feeling. It was only sentiments, and we could do nothing with it. But if you go into the history of the rite, if you try to understand the whole structure of that rite, including all the other rites round it, then you see it is a mystery that reaches down into the history of the human mind; it goes back very far—far beyond the beginnings of Christianity. You know that very important parts of the Mass—for instance, the Host—belonged to the cult of Mithras. In the cult of Mithras they used bread stamped with the cross, or divided into four; they used the little bells; and they used baptismal water—that is quite certainly pre-Christian. We even have texts that bear this out. The rite of the divine water, or the *aqua permanens*—the “eternal water”—is

an alchemical conception, older than its Christian use; and when you study the *benedictio fontis*, the actual making of the water, you see that it is an alchemical procedure; and we have a text from the first century, a text of Pseudo-Democritus, which says what the blessing was done for.

[617] These are absolute facts which are quite surely established. They point back into prehistory, into a continuity of tradition perhaps hundreds of years before Christianity. Now these mysteries have always been the expression of a fundamental psychological condition. Man expresses his most fundamental and most important psychological conditions in this ritual, this magic, or whatever you call it. And the ritual is the cult performance of these basic psychological facts. That explains why we should not change anything in a ritual. A ritual must be done according to tradition, and if you change one little point in it, you make a mistake. You must not allow your reason to play with it. For instance, take that most difficult dogma, the dogma of the Virgin Birth: it is absolutely wrong to rationalize it. If you leave it as it is, as it has been handed down, then it is true; but if you rationalize it, it is all wrong, because then you shift it over to the plane of our playful intellect, which does not understand the secret. It is the secret of virginity and the virginal conception, and that is a most important psychological fact. The sad truth is that we do not understand it any more. But, you know, in former centuries man did not need that kind of intellectual understanding. We are very proud of it; but it is nothing to be proud of. Our intellect is absolutely incapable of understanding these things. We are not far enough advanced psychologically to understand the truth, the extraordinary truth, of ritual and dogma. Therefore such dogmas should never be submitted to any kind of criticism.

[618] So, you see, if I treat a real Christian, a real Catholic, I always keep him down to the dogma, and say, "You stick to it! And if you begin to criticize it in any way intellectually, then I am going to analyse you, and then you are in the frying-pan!" When a practising Catholic comes to me, I say, "Did you confess this to your father-confessor?" Naturally he says, "No, he does not understand." "What in hell, then," I say, "did you confess?" "Oh, lousy little things of no importance"—but the main sins he never talked of. As I said, I have had quite a number of these Catholics—six. I was quite proud to have so many, and I said to them, "Now, you see, what you tell me here, this is really serious. You go now to your father-confessor and you confess, whether he understands or does not understand. That is of no concern. It must be told before God, and if you don't do it, you are out of the Church, and then analysis begins, and then things will get hot, so you are much better off in the lap of the Church." So, you see, I brought these people back into the Church, with the result that the Pope himself gave me a private blessing for having taught certain important Catholics the right way of confessing.

[619] For instance, there was a lady who played a very great role in the war. She was very Catholic, and always in the summer she used to come to Switzerland to pass her summer holiday. There is a famous monastery there with many monks, and she used to go to it for confession and spiritual advice. Now, being an interesting person, she got a bit too interested in her father-confessor, and he got a bit too interested in her, and there was some conflict. He was then removed to the Clausura,³ and she naturally collapsed, and she was advised to go to me. So she came to me in full resistance against the authorities who had interfered, and I made her go back to her spiritual authorities and confess the whole situation. And when she went back to Rome, where she lived, and where she had a confessor, he asked her, “Well, I know you from many years ago: how is it that you now confess so freely?” And she said she had learnt it from a doctor. That is the story of how I got the Pope’s private blessing.

[620] My attitude to these matters is that, as long as a patient is really a member of a church, he ought to be serious. He ought to be really and sincerely a member of that church, and he should not go to a doctor to get his conflicts settled when he believes that he should do it with God. For instance, when a member of the Oxford Group comes to me in order to get treatment, I say, “You are in the Oxford Group; so long as you are there, you settle your affair with the Oxford Group. I can’t do it better than Jesus.”

[621] I will tell you a story of such a case. A hysterical alcoholic was cured by this Group movement, and they used him as a sort of model and sent him all round Europe, where he confessed so nicely and said that he had done wrong and how he had got cured through the Group movement. And when he had repeated his story twenty, or it may have been fifty, times, he got sick of it and took to drink again. The spiritual sensation had simply faded away. Now what are they going to do with him? They say, now he is pathological, he must go to a doctor. See, in the first stage he has been cured by Jesus, in the second by a doctor! I should and did refuse such a case. I sent that man back to these people and said, “If you believe that Jesus has cured this man, he will do it a second time. And if he can’t do it, you don’t suppose that I can do it better than Jesus?” But that is just exactly what they do expect: when a man is pathological, Jesus won’t help him but the doctor will.

[622] As long as a fellow believes in the Oxford Group movement, he stays there; and as long as a man is in the Catholic Church, he is in the Catholic Church for better or worse and he should be cured by those means. And mind you, I have seen that they can be cured by those means—that is a fact! Absolution, the Holy Communion, can cure them, even in very serious cases. If the experience of the Holy Communion is real, if the ritual and the dogma fully express the psychological situation of that individual, he can be cured. If the ritual and dogma do not fully express the psychological situation of that individual, he can’t be cured. That is the reason why

you have Protestantism, and that is why Protestantism is so uncertain, why it splits and splits. That is no objection to Protestantism; it is exactly the same as the story about the Code Napoléon.

[623] After the Code Napoléon had been in use a year, the man entrusted with the execution of Napoleon's orders came back with a portfolio of immense size. Napoleon looked at it and asked, "Mais comment? Est-ce que le Code est mort?"—because the man had so many propositions to make. But the man answered, "Au contraire, Sire; il vit!"

[624] The splitting up of Protestantism into new denominations—four hundred or more we have—is a sign of life. But, alas! It is not a very nice sign of life, in the sense of a church, because there is no dogma and there is no ritual. There is not the typical symbolic life.

[625] You see, man is in need of a symbolic life—badly in need. We only live banal, ordinary, rational, or irrational things—which are naturally also within the scope of rationalism, otherwise you could not call them irrational. But we have no symbolic life. Where do we live symbolically? Nowhere, except where we participate in the ritual of life. But who, among the many, are really participating in the ritual of life? Very few. And when you look at the ritual life of the Protestant Church, it is almost nil. Even the Holy Communion has been rationalized. I say that from the Swiss point of view: in the Swiss Zwinglian Church the Holy Communion is not a communion at all; it is a meal of memory. There is no Mass either; there is no confession; there is no ritual, symbolic life.

[626] Have you got a corner somewhere in your house where you perform the rites, as you can see in India? Even the very simple houses there have at least a curtained corner where the members of the household can lead the symbolic life, where they can make their new vows or meditation. We don't have it; we have no such corner. We have our own room, of course—but there is a telephone which can ring us up at any time, and we always must be ready. We have no time, no place. Where have we got these dogmatic or these mysterious images? Nowhere! We have art galleries, yes—where we kill the gods by thousands. We have robbed the churches of their mysterious images, of their magical images, and we put them into art galleries. That is worse than the killing of the three hundred children in Bethlehem; it is a blasphemy.

[627] Now, we have no symbolic life, and we are all badly in need of the symbolic life. Only the symbolic life can express the need of the soul—the daily need of the soul, mind you! And because people have no such thing, they can never step out of this mill—this awful, grinding, banal life in which they are "nothing but." In the ritual they are near the Godhead; they are even divine. Think of the priest in the Catholic Church, who is in the Godhead: he carries himself to the sacrifice on the altar; he

offers himself as the sacrifice. Do we do it? Where do we know that we do it? Nowhere! Everything is banal, everything is “nothing but”; and that is the reason why people are neurotic. They are simply sick of the whole thing, sick of that banal life, and therefore they want sensation. They even want a war; they all want a war. They are all glad when there is a war: they say, “Thank heaven, now something is going to happen—something bigger than ourselves!”

[628] These things go pretty deep, and no wonder people get neurotic. Life is too rational, there is no symbolic existence in which I am something else, in which I am fulfilling my role, my role as one of the actors in the divine drama of life.

[629] I once had a talk with the master of ceremonies of a tribe of Pueblo Indians, and he told me something very interesting. He said, “Yes, we are a small tribe, and these Americans, they want to interfere with our religion. They should not do it,” he said, “because we are the sons of the Father, the Sun. He who goes there”; (pointing to the sun)—’that is our Father. We must help him daily to rise over the horizon and to walk over Heaven. And we don’t do it for ourselves only: we do it for America, we do it for the whole world. And if these Americans interfere with our religion through their missions, they will see something. In ten years Father Sun won’t rise any more, because we can’t help him any more.”

[630] Now, you may say, that is just a sort of mild madness. Not at all! These people have no problems. They have their daily life, their symbolic life. They get up in the morning with a feeling of their great and divine responsibility: they are the sons of the Sun, the Father, and their daily duty is to help the Father over the horizon—not for themselves alone, but for the whole world. You should see these fellows: they have a natural fulfilled dignity. And I quite understood when he said to me, “Now look at these Americans: they are always seeking something. They are always full of unrest, always looking for something. What are they looking for? There is nothing to be looked for!” That is perfectly true. You can see them, these travelling tourists, always looking for something, always in the vain hope of finding something. On my many travels I have found people who were on their third trip round the world—uninterruptedly. Just travelling, travelling; seeking, seeking. I met a woman in Central Africa who had come up alone in a car from Cape Town and wanted to go to Cairo. “What for?” I asked. “What are you trying to do that for?” And I was amazed when I looked into her eyes—the eyes of a hunted, a cornered animal—seeking, seeking, always in the hope of something. I said, “What in the world are you seeking? What are you waiting for, what are you hunting after?” She is nearly possessed; she is possessed by so many devils that chase her around. And why is she possessed? Because she does not live the life that makes sense. Hers is a life utterly, grotesquely banal, utterly poor, meaningless, with no point in it at all. If she is killed today, nothing has happened, nothing has vanished—because she was nothing! But if

she could say, “I am the daughter of the Moon. Every night I must help the Moon, my Mother, over the horizon”—ah, that is something else! Then she lives, then her life makes sense, and makes sense in all continuity, and for the whole of humanity. That gives peace, when people feel that they are living the symbolic life, that they are actors in the divine drama. That gives the only meaning to human life; everything else is banal and you can dismiss it. A career, producing of children, are all *maya* compared with that one thing, that your life is meaningful.

[631] That is the secret of the Catholic Church: that they still, to a certain extent, can live the meaningful life. For instance, if you can watch daily the sacrifice of the Lord, if you can partake of his substance, then you are filled with the Deity, and you daily repeat the eternal sacrifice of Christ. Of course, what I say is just so many words, but to the man who really lives it, it means the whole world. It means more than the whole world, because it makes sense to him. It expresses the desire of the soul; it expresses the actual facts of our unconscious life. When the wise man said, “Nature demands death,” he meant just that.

[632] So I think we can go on now to the next question. What I have spoken of is, alas, to a great extent the past. We cannot turn the wheel backwards; we cannot go back to the symbolism that is gone. No sooner do you know that this thing is symbolic than you say, “Oh, well, it presumably means something else.” Doubt has killed it, has devoured it. So you cannot go back. I cannot go back to the Catholic Church, I cannot experience the miracle of the Mass; I know too much about it. I know it is the truth, but it is the truth in a form in which I cannot accept it any more. I cannot say “This is the sacrifice of Christ,” and see him any more. I cannot. It is no more true to me; it does not express my psychological condition. My psychological condition wants something else. I must have a situation in which that thing becomes true once more. I need a new form. When one has had the misfortune to be fired out of a church, or to say “This is all nonsense,” and to quit it—that has no merit at all. But to be in it and to be forced, say, by God, to leave it—well, then you are legitimately *extra ecclesiam*. But *extra ecclesiam nulla salus*; then things really become terrible, because you are no more protected, you are no more in the *consensus gentium*, you are no more in the lap of the All-compassionate Mother. You are alone and you are confronted with all the demons of hell. That is what people don’t know. Then they say you have an anxiety neurosis, nocturnal fears, compulsions—I don’t know what. Your soul has become lonely; it is *extra ecclesiam* and in a state of no-salvation. And people don’t know it. They think your condition is pathological, and every doctor helps them to believe it. And, of course, when they say, and when everybody holds, that this is neurotic and pathological, then we have to talk that language. I talk the language of my patients. When I talk with lunatics, I talk the lunatic language, otherwise they don’t understand me. And when I talk with neurotics, I talk neurotic

with them. But it is neurotic talk when one says that this is a neurosis. As a matter of fact it is something quite different: it is the terrific fear of loneliness. It is the hallucination of loneliness, and it is a loneliness that cannot be quenched by anything else. You can be a member of a society with a thousand members, and you are still alone. That thing in you which should live is alone; nobody touches it, nobody knows it, you yourself don't know it; but it keeps on stirring, it disturbs you, it makes you restless, and it gives you no peace.

[633] So, you see. I was forced simply through my patients to try to find out what we could do about such a condition. I am not going to found a religion, and I know nothing about a future religion. I only know that in certain cases such and such things develop. For instance, take any case you want: if I go far enough, if the case demands it, or if certain conditions are favourable, then I shall observe certain unmistakable things, namely, that the unconscious facts are coming up and becoming threateningly clear. That is very disagreeable. And therefore Freud had to invent a system to protect people, and himself, against the reality of the unconscious, by putting a most depreciatory explanation upon these things, an explanation that always begins with "nothing but." The explanation of every neurotic symptom was known long ago. We have a theory about it: it is all due to a father fixation, or to a mother fixation; it is all nonsense, so you can dismiss it. And so we dismiss our souls—"Oh, I am bound by a fixation to my mother, and if I see that I have all kinds of impossible fancies about my mother, I am liberated from that fixation." If the patient succeeds, he has lost his soul. Every time you accept that explanation you lose your soul. You have not helped your soul; you have replaced your soul by an explanation, a theory.

[634] I remember a very simple case.⁴ There was a student of philosophy, a very intelligent woman. That was quite at the beginning of my career. I was a young doctor then, and I did not know anything beyond Freud. It was not a very important case of neurosis, and I was absolutely certain that it could be cured; but the case had not been cured. That girl had developed a terrific father-transference to me—projected the image of the father on me. I said, "But, you see, I'm not your father!" "I know," she said, "that you're not my father, but it always seems as if you were." She behaved accordingly and fell in love with me, and I was her father, brother, son, lover, husband—and, of course, also her hero and saviour—every thinkable thing! "But," I said, "you see, that is absolute nonsense!" "But I can't live without it," she answered. What could I do with that? No depreciatory explanation would help. She said, "You can say what you like; it is so." She was in the grip of an unconscious image. Then I had the idea: "Now, if anybody knows anything about it, it must be the unconscious, that has produced such an awkward situation." So I began to watch the dreams seriously, not just in order to catch certain fantasies, but because I really wanted to understand how her psychic system reacted to such an abnormal situation

—or to such a very normal situation, if you like to say so, because that situation is usual. She produced dream? in which I appeared as the father. That we dealt with. Then I appeared as the lover, and I appeared as the husband—that was all in the same vein. Then I began to change my size: I was much bigger than an ordinary human being; sometimes; I had even divine attributes. I thought “Oh, well, that is the old saviour idea.” And then I took on the most amazing forms. I appeared, for instance, the size of a god, standing in the fields and holding her in my arms as if she were a baby, and the wind was blowing over the corn and the fields were waving like waves of water, and in the same way I rocked her in my arms. And then, when I saw that picture, I thought, “Now I see what the unconscious really is after: the unconscious wants to make a god of me: that girl needs a god—at least, her unconscious needs a god. Her unconscious wants to find a god, and because it cannot find a god, it says Dr. Jung is a god.” And so I said to her what I thought: “I surely am not a god, but your unconscious needs a god. That is a serious and a genuine need. No time before us has fulfilled that need; you are just an intellectual fool, just as much as I am, but we don’t know it.” That changed the situation completely; it made all the difference in the world. I cured that case, because I fulfilled the need of the unconscious.

[635] I can tell you another case.⁵ The patient was a Jewish girl. She was a funny little character, a very pretty, elegant little thing—and I thought “What a useless beast!” She had a frightful neurosis, a terrible anxiety neurosis, with awful attacks of fear, and she had suffered from these things for years. She had been with another analyst and had turned his head altogether; he fell in love with her, and she found no help in him. Then she came to me. The night before she came—before I had seen her at all—I had a dream, and I dreamed of a young girl, a pretty girl that came to me and I did not understand her case at all. Suddenly I thought, “By Jove! Hasn’t she an extraordinary father complex!” And I felt it as a sort of revelation. I was much impressed by that dream; I did not know to what it referred. Then, when that girl came in next day, instantly I thought of my dream: “Perhaps she is the one!” First she told me her story. At first I couldn’t see what it was all about, and then I thought, “Isn’t it a father complex?” I saw nothing of a father complex, but it gave me the idea of asking more about the history of her family. Then I found out that she came from a Hasidic family—you know, those great mystics. Her grandfather had been a sort of wonder-rabbi—he had second sight—and her father had broken away from that mystic community, and she was completely sceptical and completely scientific in her outlook on life. She was highly intelligent, with that murderous kind of intellect that you very often find in Jews. So I thought, “Aha! What does that mean with reference to her neurosis? Why does she suffer from such an abysmal fear?” And I said to her, “Look here, I’m going to tell you something, and you will probably think it is all foolishness, but you have been untrue to your God. Your grandfather led the right

life, but you are worse than a heretic; you have forsaken the mystery of your race. You belong to holy people, and what do you live? No wonder that you fear God, that you suffer from the fear of God.”

[636] Within one week I had cured that anxiety neurosis, and that is no lie (I am too old to lie!)—that is a fact. Before she had had months, many months, of analysis, but all too rational. With that remark she turned the corner, as if she suddenly began to understand, and her whole neurosis collapsed. It had no point in it any more: it had been based upon the mistake that she could live with her miserable intellect alone in a perfectly banal world, when in fact she was a child of God and should have lived the symbolic life, where she would have fulfilled the secret will in herself that was also in her family. She had forgotten all that, and was living, of course, in full contradiction to her whole natural system. Suddenly her life had a meaning, and she could live again; her whole neurosis went by the board.

[637] In other cases, of course, it is not so—should I say—simple (it was not quite simple, you know!). I do not want to tell you further details of that case. It was a most instructive one, but I would rather tell you of other cases where things are not so simple, where you have to guide people quite slowly and wait for a long time until the unconscious produces the symbols that bring them back into the original symbolic life. Then you have to know a great deal about the language of the unconscious, the language of dreams. Then you see how the dreams begin to produce extraordinary figures. These are all found in history under different names. They are unknown quantities, but you find these figures in a literature which is itself completely obsolete. If you happen to know these symbols, you can explain to your patients what the unconscious is after.

[638] Of course, I can't give you a full description of these things, I can only mention them. From my observations I learned that the modern unconscious has a tendency to produce a psychological condition which we find, for instance, in medieval mysticism. You find certain things in Meister Eckhart; you find many things in Gnosticism; that is a sort of esoteric Christianity. You find the idea of the Adam Kadmon in every man—the Christ within. Christ is the second Adam, which is also, in exotic religions, the idea of the Atman or the complete man, the original man, the “all-round” man of Plato, symbolized by a circle or a drawing with circular motifs. You find all these ideas in medieval mysticism; you find them all through alchemical literature, beginning with the first century after Christ. You find them in Gnosticism, you find many of them in the New Testament, of course, in Paul. But it is an absolutely consistent development of the idea of Christ within—not the historical Christ without, but the Christ within; and the argument is that it is immoral to allow Christ to suffer for us, that he has suffered enough, and that we should carry our own sins for once and not shift them off on to Christ—that we should carry them all.

Christ expresses the same idea when he says, “I appear in the least of your brethren”;⁶ and what about it, my dear son, if the least of your brethren should be yourself—what about it then? Then you get the intimation that Christ is not to be the least in your life, that we have a brother in ourselves who is really the least of our brethren, much worse than the poor beggar whom you feed. That is, in ourselves we have a shadow; we have a very bad fellow in ourselves, a very poor man, and he has to be accepted. What has Christ done—let us be quite banal about it—what has Christ done when we consider him as an entirely human creature? Christ was disobedient to his mother; Christ was disobedient to his tradition: Christ falsified himself, and played it out to the bitter end: he carried through his hypothesis to the bitter end. How was Christ born? In the greatest misery. Who was his father? He was an illegitimate child—humanly the most miserable situation: a poor girl having a little son. That is our symbol, that is ourselves; we are all that. And if anyone lives his own hypothesis to the bitter end (and pays with his death, perhaps, he knows that Christ is his brother.

[639] That is modern psychology, and that is the future. That is the true future, that is the future of which I know—but, of course, the historical future might be quite different. We do not know whether it is not the Catholic Church that will reap the harvest that is now going to be cut down. We do not know that. We do not know whether Hitler is going to found a new Islam. (He is already on the way; he is like Mohammed. The emotion in Germany is Islamic; warlike and Islamic. They are all drunk with a wild god.) That can be the historic future. But I do not care for a historic future at all, not at all; I am not concerned with it. I am only concerned with the fulfilment of that will which is in every individual. My history is only the history of those individuals who are going to fulfil their hypotheses. That is the whole problem; that is the problem of the true Pueblo: that I do today everything that is necessary so that my Father can rise over the horizon. That is my standpoint. Now I think I have talked enough!

Discussion

Canon H. England:

[640] In the Church of England ritual we have, after the Holy Communion: “Here we offer and present unto Thee, O Lord, ourselves, our souls and bodies, to be a reasonable, holy, and lively sacrifice.” That is the sacrifice and that is the ritual which should satisfy the conditions you demand, is it not?

Professor Jung:

[641] Absolutely. Yes, the Church of England has a great asset in that. The Church of England, of course, is not the whole Protestant world, and it is not quite Protestant in England.

The Bishop of Southwark:

[642] The question is whether it is quite a Protestant world.

Professor Jung:

[643] But I should call the Church of England a real church. Protestantism in itself is no church at all.

The Bishop of Southwark:

[644] But there are other parts of the Protestant world which have churches. There are, for instance, the Lutherans in Sweden; take them as an example of a reformed church. Their conditions are more like our own. Have you ever come across the Orthodox ritual? Does the Russian ritual have the same effect?

Professor Jung:

[645] I am afraid that, owing to historical events, the whole thing has been interrupted. I have seen a few Orthodox people, and I am afraid they were no longer very orthodox.

The Bishop of Southwark:

[646] I meet a good number of Russian exiles in Paris, in a colony there, who are very deliberately trying to keep alive the old Russian religious life with as little change as

possible.

Professor Jung:

[647] I have never seen a real member of the Orthodox Church, but I am quite convinced that as they live the symbolic life in that church they are all right.

The Bishop of Southwark:

[648] We Anglicans are in much closer touch with the Orthodox Church than with the Catholics, and they seem to us rather too symbolic—not quite to be facing up to the straight path, the facts they ought to be dealing with. They have rather the exile psychology—a world of their own—and I am rather frightened of that psychology for some of our own people, who seem to want to take refuge in symbolism from the responsibilities of life.

Professor Jung:

[649] With the best truth you can cheat; you can cheat with anything, so there are people who take illegitimate refuge in symbolism. For instance, monasteries are full of people who run away from life and its obligations and live the symbolic life—the symbolic life of their past. Such cheats are always punished, but it is a peculiar fact that they can stand it somehow without getting too neurotic. There is a peculiar value in the symbolic life. It is a fact that the primitive Australians sacrifice to it two-thirds of their available time—of their lifetime in which they are conscious.

The Bishop of Southwark:

[650] King Alfred the Great did something very much like that.

Professor Jung:

[651] Yes, that is the secret of primitive civilizations.

The Bishop of Southwark:

[652] He was a very practical civilizing man.

Professor Jung:

[653] Yes, because the very fact that you live the symbolic life has an extraordinarily civilizing influence. Those people are far more civilized and creative on account of

the symbolic life. People who are only rational have very little influence; it is all talk, and with talk you get nowhere.

Canon England:

[654] But symbols may appeal to reason, for all that; to an enlightened reason.

Professor Jung:

[655] They may, yes! Symbols often cause an extraordinary intensity of mental life, even of intellectual life. If you look through the Patristic literature you find mountains of emotion, all couched in symbolism.

The Reverend D. Glan Morgan:

[656] But what are the Protestants to do now, especially we of the left—the Free Churches—the Nonconformists? We have no symbols at all, we have rejected them, lock, stock, and barrel. Our chapels are dead, our pulpits are platforms.

Professor Jung:

[657] Excuse me! You have a lot of symbolism still. You speak of God or of Jesus? There you are! What could be more symbolic? God is a symbol of symbols!

Mr. Morgan:

[658] Even that symbol becomes a contradiction. And there are crowds of people in our churches who can believe in Jesus Christ, but who cannot believe in God.

Professor Jung:

[659] Yes, and in the Catholic Church there are plenty who believe in the Church, but don't believe in God—nor in anything else!

The Bishop of Southwark:

[660] How far has this something to do with it? Not only has the Roman Catholic Church a very full symbolic system, but it is combined with the profession of absolute certitude—the dogma of infallibility. That must have a direct bearing on the value of symbols.

Professor Jung:

[661] Very important. The Church is absolutely right, wholly right, in insisting on that absolute validity, otherwise she opens the door to doubt.

Dr. Ann Harling:

[662] To conflict or neurosis?

Professor Jung:

[663] Absolutely. Therefore “extra ecclesiam nulla salus.”

The Bishop of Southwark:

[664] Are all forms of conflict neurosis?

Professor Jung:

[665] Only when the intellect breaks away from that symbolic observance. When the intellect does not serve the symbolic life it is the devil: it makes you neurotic.

Mr. Morgan:

[666] May there be a transition, a moving ever from one system to another, and may not that be neurotic?

Processor Jung:

[667] Neurosis is a transitory phase, it is the unrest between two positions.

Mr. Morgan:

[668] I am asking because I myself feel at the moment that there is a good deal of neurosis among Protestants on account of the price that has to be paid for moving over from one state to the other.

Professor Jung:

[669] That is what I say: “extra ecclesiam nulla salus.” you get into a terrible frying-pan when you get out of the Church: therefore I don’t wish it on people. I point out the validity of the primary Church.

The Bishop of Southwark:

[670] What are we to do with the great majority of people we have to deal with who are not in any church? They say they are in the Church of England, but they don't belong in any sense.

Professor Jung:

[671] I am afraid you can't do anything with such people. The Church is there and is valid for those who are inside. Those who are outside the walls of the Church cannot be brought back into the Church by the ordinary means. But I wish the clergy would understand the language of the soul, and that the clergyman would be a *directeur de conscience!* Why should I be a *directeur de conscience?* I am a doctor: I have no preparation for that. It is the natural calling of the clergyman: he should do it. Therefore I wish that a new generation of clergymen would come in and do the same as they do in the Catholic Church: that they would try to translate the language of the unconscious, even the language of dreams, into proper language. For instance, I know that there is now in Germany the Berneuchener Circle,⁷ a liturgical movement; and one of the main representatives is a man who has a great knowledge of symbolism. He has given me quite a number of instances, which I am able to check, where he translated the figures in dreams into dogmatic language with the greatest success, and these people quietly slipped back into the order of the Church. They have no right to be neurotic. They belong to a church, and if you can help them to slip back to the Church you have helped them. Several of my patients became Catholics, others went back into the Church organization. But it must be something that has substance and form. It is by no means true that when one analyses somebody he necessarily jumps into the future. He is perhaps meant for a church, and if he can go back into a church, perhaps that is the best thing that can happen.

Mr. Morgan:

[672] What if he can't?

Professor Jung:

[673] Then there is trouble; then he has to go on the Quest; then he has to find out what his soul says; then he has to go through the solitude of a land that is not created. I have published such an example in my lectures⁸—that of a great scientist, a very famous man, who lives today.⁹ He set out to see what the unconscious said to him, and it gave him a wonderful lead. That man got into order again because he gradually accepted the symbolic data, and now he leads the religious life, the life of the careful observer. Religion is careful observation of the data. He now observes all the things that are brought him by his dreams; that is his only guidance.

[674] We are in a new world with that; we are exactly like primitives. When I went to East Africa, I went to a small tribe in Mount Elgon and I asked the medicine-man about dreams. He said, "I know what you mean; my father still had dreams." I said, "You have no dreams?" And then he wept and answered, "No, I have no dreams any more." I asked, "Why?" He answered, "Since the British came into the country." "Now, how is that?" He said, "The District Commissioner knows when there shall be war; he knows when there are diseases; he knows where we must live—he does not allow us to move." The political guidance is now represented by the D.C., by the superior intelligence of the white man; therefore, why should they need dreams? Dreams were the original guidance of man in the great darkness. Read that book of Rasmussen's about the Polar Eskimos.¹⁰ There he describes how a medicine-man became the leader of his tribe on account of a vision. When a man is in the wilderness, the darkness brings the dreams—*somnia a Deo missa*—that guide him. It has always been so. I have not been led by any kind of wisdom; I have been led by dreams, like any primitive. I am ashamed to say so, but I am as primitive as any nigger,¹¹ because I do not know! When you are in the darkness you take the next thing, and that is a dream. And you can be sure that the dream is your nearest friend; the dream is the friend of those who are not guided any more by the traditional truth and in consequence are isolated. That was the case with the old alchemical philosophers, and you read in the *Tractatus Aureus* of Hermes Trismegistus a passage that bears out what I said about isolation. There you read: "(Deus) in quo est adiuvatio cuiuslibet sequestrati" (God, in whom is the help of all who are lonely). Hermes, at the same time, was a real leader of souls and the very incarnation of inspiration, thus representing the unconscious manifest in dreams. So, you see, the one who is going alone and has no guidance, he has the *somnia a Deo missa*; he has no D.C. Of course, when we have a D.C. we do not need a dream, but when we are alone, that is something else.

The Bishop of Southwark:

[675] A practising parson, a Roman Catholic, has a D.C., an authority, and does not need dreams.

Professor Jung:

[676] Agreed! Nevertheless, there are people in the Church who have *somnia a Deo missa*, and the Church is very careful to appreciate the importance of such dreams. They don't deny the fact that there are *somnia a Deo missa*; the Church reserves the right of judgment, but they do consider it.

Lt.-Colonel H. M. Edwards:

[677] Are Roman Catholic priests being trained as psychotherapists?

Professor Jung:

[678] Yes.

Colonel Edwards:

[679] Not in this country?

Professor Jung:

[680] No, the Jesuits are. For example, the main father-confessor of Jena is a Jesuit trained in psychotherapy.

Dr. A. D. Belilios:

[681] Of the Jungian school?

Professor Jung:

[682] Of all schools. I am afraid he doesn't go as far as I go. I asked him about his position as to dreams, and he said, "Well, there we have to be careful, and we are already a bit suspect. We have the means of grace of the Church." "Right you are," I said, "you don't need dreams. I can give no absolution, I have no means of grace; therefore I must listen to dreams. I am a primitive; you are a civilized man." In a way that man is much more wonderful than I am. He can be a saint; I cannot be a saint—I can only be a nigger, very primitive, going by the next thing—quite superstitious.

Wing-Commander T. S. Rippon:

[683] How do you feel with the question of life after death?

Professor Jung:

[684] I have not been there consciously yet. When I die, I shall say "Now, let us see!" For the time being I am in this form, and I say, "Now, what is here? Let us do everything we can here." If, when we die, we find there is a new life, I shall say, "Now let us live once more—*encore une fois!*" I don't know, but I can tell you this: the unconscious has no time. There is no trouble about time in the unconscious. Part of our psyche is not in time and not in space. They are only an illusion, time and space, and so in a certain part of our psyche time does not exist at all.

Mr. Derek Kitchin:

[685] You wrote somewhere, Professor, that for many persons a belief in a future life was a necessity to psychological health.

Professor Jung:

[686] Yes. You would be out of tune if you did not consider immortality when your dreams put you up against that problem; then you should decide. If they don't you can leave it. But if they put you up against it, then you have to say, "I must try how I feel. Let us assume that there is no such thing as immortality, no life after death: how do I feel about that? How do I function with such a conviction?" Then, perhaps, your stomach goes wrong. So you say, "Let us assume that I am immortal," and then you function. So you must say, "That must be right." How do we know? How does an animal know that the particular bit of grass it has eaten is not poisonous, and how do animals know that something is poisonous? They go wrong. That is how we know the truth: the truth is that which helps us to live—to live properly.

The Reverend Francis Boyd:

[687] That which works; the pragmatic test.

Professor Jung:

[688] That which really works. I have no assumptions about these things. How can I? I only know that if I live in a certain way I live wrongly; I am unhealthy. And if I live in another way I am right. For instance, if the Pueblos believe that they are the sons of the Father Sun, they are in order. So I say, "I wish I could be a son of the Sun." Alas! I can't do it; I can't afford it; my intellect doesn't allow it. So I am bound to find another form. But they are all right. It would be the greatest mistake to tell those people that they are not the sons of the Sun. I tried, for instance, the argument of St. Augustine:¹² "Non est Dominus Sol factus, sed per quem Sol factus est" (God is not the sun but the one who made the sun). But my Pueblo got into a frightful state; he thought that was the most awful blasphemy. He said, "This *is* the Father; there is no Father behind it. How can we think of a Father we cannot see?" And in so far as they live in that belief, it is true. Anything that *lives* on earth, is true. So the Christian dogma is true, much truer than we have ever thought. We think we are much cleverer. As long as we don't understand it, as long as we don't see where it could lead beyond, there is no reason why we should give it up. If we see we are out of it, then we have what we call a superior point of view. That is another thing. Analysis is

merely a means of making us more conscious of our perplexity; we are all on the Quest.

The Bishop of Southwark:

[689] Would you say the same of the Nazi or the Mohammedan, that they are right to go on in their faith?

Professor Jung:

[690] God is terrible; the living God is a living fear. I think it is an instrument, as Mohammed was for that people. All people, for instance, who are filled with that uncanny power, are always most disagreeable for others. I am quite convinced that some of the people in the Old Testament were very disagreeable people.

The Reverend W. Hopkins:

[691] There is obviously, and always has been, a conflict between science and religion. It is not so acute now as it has been. How do you bring about a reconciliation, which obviously is the sort of thing that is needed?

Professor Jung:

[692] There is no conflict between religion and science. That is a very old-fashioned idea. Science has to consider what there is. There is religion, and it is one of the most essential manifestations of the human mind. It is a fact, and science has nothing to say about it; it simply has to confirm that there is that fact. Science always runs after these things; it does not try to explain the phenomena. Science cannot establish a religious truth. A religious truth is essentially an experience, it is not an opinion. Religion is an absolute experience. A religious experience is absolute, it cannot be discussed. For instance, when somebody has had a religious experience, he just has such an experience, and nothing can take it away from him.

Mr. Hopkins:

[693] In the nineteenth century the scientists were apt to be much more dogmatic than they are now. They dismissed all religion as an illusion. But now they admit it, and they experience it themselves.

Professor Jung:

[694] Our science is phenomenology. In the nineteenth century science was labouring under the illusion that science could establish a truth. No science can establish a truth.

Mr. Hopkins:

[695] But it is the science of the nineteenth century that the ordinary people have today. That is our problem.

Professor Jung:

[696] Yes, you are up against it. It has filtered down into the lower strata of the population, and has worked no end of evil. When the asses catch hold of science, that is awful. Those are the great mental epidemics of our time; they are all insane, the whole crowd!

IV

ON OCCULTISM

(related to Volume I of the Collected Works)

ON SPIRITUALISTIC PHENOMENA¹

[697] It is impossible, within the short space of a lecture, to say anything fundamental about such a complicated historical and psychological problem as spiritualism^{1a} appears to be. One must content oneself with shedding a little light on one or the other aspect of this intricate question. This kind of approach will at least give the hearer an approximate idea of the many facets of spiritualism. Spiritualism, as well as being a theory (its advocates call it “scientific”), is a religious belief which, like every religious belief, forms the spiritual core of a religious movement. This sect believes in the actual and tangible intervention of a spiritual world in our world, and consequently makes a religious practice of communicating with the spirits. The dual nature of spiritualism gives it an advantage over other religious movements: not only does it believe in certain articles of faith that are not susceptible of proof, but it bases its belief on a body of allegedly scientific, physical phenomena which are supposed to be of such a nature that they cannot be explained except by the activity of spirits. Because of its dual nature—on the one side a religious sect, on the other a scientific hypothesis—spiritualism touches upon widely differing areas of life that would seem to have nothing in common.

[698] Spiritualism as a sect originated in America in the year 1848. The story of its origin is a strange one.² Two girls of the Methodist family Fox, in Hydesville, near Rochester (New York), were frightened every night by sounds of knocking. At first a great scandal arose, because the neighbours suspected that the devil was up to his usual tricks. Gradually, however, communication was established with the knocking sounds when it was discovered that questions were answered with a definite number of knocks. With the help of a knocking alphabet, it was learned that a man had been murdered in the Foxes’ house, and his body buried in the cellar. Investigations were said to have confirmed this.

[699] Thus far the report. The public performances given by the Foxes with the poltergeists were quickly followed by the founding of other sects. Tableturning, much practised earlier, was taken up again. Numerous mediums were sought and found, that is, persons in whose presence such phenomena as knocking noises occurred. The movement spread rapidly to England and the continent. In Europe, spiritualism took the form chiefly of an epidemic of tableturning. There was hardly an evening party or dance where the guests did not steal away at a late hour to question the table. This particular symptom of spiritualism was rampant everywhere. The religious sects

made less headway, but they continued to grow steadily. In every big city today there is a fairly large community of practising spiritualists.

[700] In America, which swarms with local religious movements, the rise of spiritualism is understandable enough. With us, its favourable reception can be explained only by the fact that the ground had been historically prepared. The beginning of the nineteenth century had brought us the Romantic Movement in literature, a symptom of a widespread, deep-seated longing for anything extraordinary and abnormal. People adored wallowing in Ossianic emotions, they went crazy over novels set in old castles and ruined cloisters. Everywhere prominence was given to the mystical, the hysterical; lectures about life after death, about sleepwalkers and visionaries, about animal magnetism and mesmerism, were the order of the day. Schopenhauer devoted a long chapter to all these things in his *Parerga und Paralipomena*, and he also spoke of them at various places in his *chef d'œuvre*.³ Even his important concept of “sanctity” is a far-fetched, mystico-aesthetic ideal. Similar movements made themselves felt in the Catholic church, clustering round the strange figure of Johan Joseph von Görres 1776–1848. Especially significant in this respect is his four-volume work *Die christliche Mystik*, Regensburg, 1836–42,. The same trends appear in his earlier book. *Emanuel Swedenborg, seine Visionen und sein Verhältnis zur Kirche*, Speyer 1827,. The Protestant public raved about the soulful poetry of Justinus Kerner and his clairvoyante, Frau Friederike Hauffe, while certain theologians gave vent to their catholicizing tendencies by excommunicating spirits. From this period, too, come a large number of remarkable psychological descriptions of abnormal people—ecstatics, somnambulists, sensitives. They were much in demand and were cultivated assiduously. A good example was Frau Hauffe herself, the clairvoyante of Prevorst, and the circle of admirers who gathered round her. Her Catholic counterpart was Katharina Emmerich, the ecstatic nun of Dulmen. Reports of similar personalities were collected together in a weighty tome by an anonymous savant, entitled “The Ecstatic Virgins of the Tyrol. Guiding Stars in the Dark Firmament of Mysticism.”⁴

[701] When these strange personages were investigated, the following suprasensible processes were observed:

1. “Magnetic” phenomena.
2. Clairvoyance and prophecy.
3. Visions.

[702] 1. *Animal magnetism*, as understood at the beginning of the nineteenth century, covered a vaguely defined area of physiological and psychological phenomena which, it was thought, could all be explained as “magnetic.” “Animal magnetism” had been in the air ever since the brilliant experiments of Franz Anton Mesmer. It

was Mesmer who discovered the art of putting people to sleep by light passes of the hand. In some people this sleep was like the natural one, in others it was a “waking sleep”; that is, they were like sleepwalkers, only part of them was asleep, while some senses remained awake. This half-sleep was also called “magnetic sleep” or somnambulism. People in these states were wholly under the will of the magnetist, they were “magnetized” by him. Today, as we know, there is nothing wonderful about these states; they are known as hypnosis and we use the mesmeric passes as a valuable adjunct to other methods of suggestion. The significance attributed to the passes quickly led to their being grossly overestimated. People thought that some vitalistic force had been discovered; they spoke of a “magnetic fluid” that streamed from the magnetist into the patient and destroyed the diseased tissue. They also used it to explain the movements of the table in tableturning, imagining that the table was vitalized by the laying on of hands and could therefore move about like a living thing. The phenomena of the divining rod and the automatically swinging pendulum were explained in the same way. Even completely crazy phenomena of this sort were widely reported and believed. Thus the *Neue Preussische Zeitung* reported from Barmen, in Pomerania that a party of seven persons sat themselves round a table in a boat, and magnetized it. “In the first 20 minutes the boat drifted 50 feet downstream. Then it began to turn, with steadily increasing speed, until the rotary movement had carried it through an arc of 180 degrees in 3 minutes. Eventually, by skilful manipulation of the rudder, the boat moved forwards, and the party travelled half a mile upstream in 40 minutes, but on the return journey covered the same distance in 26 minutes. A crowd of spectators, watching the experiment from the banks of the river, received the ‘table travellers’ with jubilation.” In very truth, a mystical motorboat! According to the report, the experiment had been suggested by a Professor Nägeli, of Freiburg im Breisgau.

[703] Experiments in divination are known from the grey dawn of history. Thus Ammianus Marcellinus reports from A.D. 371 that a certain Patricius and Hilarius, living in the reign 364–78 of the Emperor Valens, had discovered by the “abominable arts of soothsaying” who would succeed to the throne. For this purpose they used a metal bowl, with the alphabet engraved round the rim. Over it amid fearful oaths, they suspended a ring on a thread. This began to swing, and spelt out the name Theodorus. When their magic was divulged, they were arrested and put to death.

[704] Ordinarily, experiments with the automatic movements of the table, the divining rod and the pendulum are not as bizarre as the first example or as dangerous as the second. The various phenomena that may occur in tableturning have been described in a treatise by Justinus Kerner bearing the significant title: “The Somnambulant Tables. A History and Explanation of these Phenomena”⁵, 1853,. They have also been

described by the late Professor Thury of Geneva, in *Les Tables parlantes au point de vue de la physique générale*, 1855,.

[705] *Clairvoyance and prophecy* are further characteristics of somnambulists. Clairvoyance in time and space plays a large role in the biographies and descriptions of these cases. The literature abounds in more or less credible reports, most of which have been collected by Gurney, Myers, and Podmore in their book *Phantasms of the Living*, 1886,.

[706] An excellent example of clairvoyance is preserved for us in philosophical literature and is especially interesting because it was personally commented on by Kant. In an undated letter to Charlotte von Knobloch, he wrote as follows about the spirit-seer Swedenborg:⁶

[707] The following occurrence appears to me to have the greatest weight of proof, and to place the assertion respecting Swedenborg's extraordinary gift beyond all possibility of doubt.

[708] In the year 1759, towards the end of September, on Saturday at four o'clock p.m., Swedenborg arrived at Gottenburg from England, when Mr. William Castel invited him to his house, together with a party of fifteen persons. About six o'clock Swedenborg went out, and returned to the company quite pale and alarmed. He said that a dangerous fire had just broken out in Stockholm, at the Södermalm (Gottenburg is about fifty German miles from Stockholm), and that it was spreading very fast. He was restless, and went out often. He said that the house of one of his friends, whom he named, was already in ashes, and that his own was in danger. At eight o'clock, after he had been out again, he joyfully exclaimed, 'Thank God! the fire is extinguished; the third door from my house.' This news occasioned great commotion throughout the whole city, but particularly amongst the company in which he was. It was announced to the Governor the same evening. On Sunday morning Swedenborg was summoned to the Governor who questioned him concerning the disaster. Swedenborg described the fire precisely, how it had begun and in what manner it had ceased, and how long it had continued. On the same day the news spread through the city, and as the Governor thought it worthy of attention, the consternation was considerably increased; because many were in trouble on account of their friends and property, which might have been involved in the disaster. On Monday evening a messenger arrived at Gottenburg, who was despatched by the Board of Trade during the time of the fire. In the letters brought by him, the fire was described precisely in the manner stated by Swedenborg. On Tuesday morning the Royal Courier arrived at the Governor's with the melancholy intelligence of the fire, of the loss which it had occasioned, and of the houses it had damaged and ruined, not in the least differing from that which Swedenborg had given at the very time when it happened; for the fire was extinguished at eight o'clock.

[709] What can be brought forward against the authenticity of this occurrence (the conflagration in Stockholm)? My friend who wrote this to me has examined all, not only in Stockholm, but also, about two months ago, in Gottenburg, where he is well acquainted with the most respectable houses, and where he could obtain the most authentic and complete information, for as only a very short time had elapsed since 1759 most of the inhabitants are still alive who were eyewitnesses of this occurrence.

[710] *Prophecy* is a phenomenon so well known from the teachings of religion that there is no need to give any examples.

[711] 3. *Visions* have always figured largely in miraculous tales, whether in the form of a ghostly apparition or an ecstatic vision. Science regards visions as delusions of the senses, or hallucinations. Hallucinations are very common among the insane. Let me cite an example from the literature of psychiatry:

[712] A twenty-four-year-old servant girl, with an alcoholic father and a neurotic mother, suddenly begins falling into peculiar states. From time to time she falls into a state of consciousness in which she sees everything that comes into her mind vividly before her, as though it were there in reality. All the time the images keep changing with breathtaking speed and lifelikeness. The patient, who in actual life is nothing but a simple country girl, then resembles an inspired seer. Her features become transfigured, her movements flow with grace. Famous figures pass before her mind's eye. Schiller appears to her in person and plays with her. He recites his poems to her. Then she herself begins to recite, improvising in verse the things she has read, experienced, and thought. Finally she comes back to consciousness tired and exhausted, with a headache and a feeling of oppression, and with only an indistinct memory of what has happened. At other times her second consciousness has a sombre character. She sees ghostly figures prophesying disaster, processions of spirits, caravans of strange and terrifying beastlike forms, her own body being buried, etc.⁷

[713] Visionary ecstasies are usually of this type. Numerous visionaries are known to us from history, among them many of the Old Testament prophets. There is the report of St. Paul's vision on the road to Damascus, followed by a blindness that ceased at the psychological moment. This blindness reminds us on the one hand of the blindness which can be produced by suggestion, and on the other hand of the blindness which occurs spontaneously with certain hysterical patients and again disappears at a suitable psychological moment. The best visions, and the ones that are psychologically the most transparent, are found in the legends of the saints, the visions being most colourful in the case of female saints experiencing the heavenly marriage. An outstanding visionary type was the Maid of Orleans, who was unconsciously imitated by the devout dreamer Thomas Ignaz Martin at the time of Louis XVIII.⁸

[714] Swedenborg, a learned and highly intelligent man, was a visionary of unexampled fertility. His importance is attested by the fact that he had a considerable influence on Kant.⁹

[715] These remarks are not meant to be conclusive, they are only intended to sketch in broad outline the state of knowledge at that time and its mystical tendency. They give some idea of the psychological premises which explain the rapid spread of American spiritualism in Europe. The tableturning epidemic of the fifties has already been mentioned. It reached a climax in the sixties and seventies. In Paris, spiritualistic séances were held at the court of Napoleon III. Famous and sometimes infamous mediums appeared—Cumberland, the Davenport brothers, Home, Slade, Miss Cook. This was the real heyday of spiritualism, for these mediums produced marvellous phenomena, quite extraordinary things which went so far beyond the bounds of credibility that a thinking person who was not himself an eyewitness could only treat them with scepticism. The impossible happened: human bodies, and parts of bodies, materialized out of thin air, bodies that had an intelligence of their own and declared themselves to be the spirits of the dead. They complied with the doubting requests of the worldlings and even submitted to experimental conditions; on vanishing from this world, they left behind pieces of their white gauzy robes, prints of their hands and feet, handwriting on the inner side of two slates sealed together, and, finally, even let themselves be photographed.

[716] But the full impact of these tidings, impressive as they were, was not felt until the famous English physicist, William Crookes, in his *Quarterly Journal of Science*, presented to the world a report on the observations he had made during the past eight years, which had convinced him of the reality of the phenomena in question. Since the report is concerned with observations at which none of us was present, under conditions which it is no longer possible to check, we have no alternative but to let the observer himself inform us how these observations were mirrored in his brain. The tone of the report at least allows us to surmise the state of his feelings at the time of writing. I shall therefore cite verbatim a passage from his investigations during the years 1870–73:¹⁰

CLASS VI

The Levitation of Human Beings

[717] This has occurred in my presence on four occasions in darkness. The test conditions under which they took place were quite satisfactory, so far as the judgment was concerned: but ocular demonstration of such a fact is so necessary to disturb our preformed opinions as to “the naturally possible and impossible,” that I will here

only mention cases in which the deductions of reason were confirmed by the sense of sight.

[718] On one occasion I witnessed a chair, with a lady sitting on it, rise several inches from the ground. On another occasion, to avoid the suspicion of this being in some way performed by herself, the lady knelt on the chair in such manner that its four feet were visible to us. It then rose about three inches, remained suspended for about ten seconds, and then slowly descended. At another time two children, on separate occasions, rose from the floor with their chairs, in full daylight, under (to me) most satisfactory conditions; for I was kneeling and keeping close watch upon the feet of the chair, and observing that no one might touch them.

[719] The most striking cases of levitation which I have witnessed have been with Mr. Home. On three separate occasions have I seen him raised completely from the floor of the room. Once sitting in an easy chair, once kneeling on his chair, and once standing up. On each occasion I had full opportunity of watching the occurrence as it was taking place.

[720] There are at least a hundred recorded instances of Mr. Home's rising from the ground, in the presence of as many separate persons, and I have heard from the lips of the three witnesses to the most striking occurrence of this kind—the Earl of Dunraven Lord Lindsay, and Captain C. Wynne—their own most minute accounts of what took place. To reject the recorded evidence on this subject is to reject all human testimony whatever; for no fact in sacred or profane history is supported by a stronger array of proofs.

[721] The accumulated testimony establishing Mr. Home's levitations is overwhelming. It is greatly to be desired that some person, whose evidence would be accepted as conclusive by the scientific world—if indeed there lives a person whose testimony *in favour* of such phenomena would be taken—would seriously and patiently examine these alleged facts. Most of the eye-witnesses to these levitations are now living, and would, doubtless, be willing to give their evidence. But, in a few years, such *direct* evidence will be difficult, if not impossible, to be obtained.

[722] It is obvious from the tone of this passage that Crookes was completely convinced of the reality of his observations. I refrain from further quotations because they would not tell us anything new. It is sufficient to remark that Crookes saw pretty well everything that occurred with these great mediums. It is hardly necessary to stress that if this unprecedented happening is an actual fact, the world and science have been enriched by an experience of the most tremendous importance. For a variety of reasons, it is not possible to criticize Crookes's powers of apprehension and retention during those years from the psychiatric point of view. We only know that at that time Crookes was not manifestly insane. Crookes and his observations must remain for the present an unsolved psychological enigma. The same is true of a

number of other observers whose intelligence and honesty one does not wish to disparage without good reason. Of numerous other observers, noted for their prejudices, lack of criticism, and exuberant imagination, I shall say nothing: they are ruled out from the start.

[723] One does not have to be particularly beset by doubts as to whether our knowledge of the world in the twentieth century has really attained the highest possible peak to feel humanly touched by this forthright testimony of an eminent scholar. But, in spite of our sympathy, we may leave out of account the question of the physical reality of such phenomena, and instead turn our attention to the psychological question: how does a thinking person, who has shown his sober-mindedness and gift for scientific observation to good advantage in other fields, come to assert that something inconceivable is a reality?

[724] This psychological interest of mine has prompted me to keep track of persons who are gifted as mediums. My profession as a psychiatrist gave me ample opportunities for this, particularly in a city like Zurich. So many remarkable elements converging in so small a space can perhaps be found nowhere else in Europe. In the last few years I have investigated eight mediums, six of them women and two of them men. The total impression made by these investigations can be summed up by saying that one must approach a medium with a minimum of expectations if one does not want to be disappointed. The results are of purely psychological interest, and no physical or physiological novelties came to light. Everything that may be considered a scientifically established fact belongs to the domain of the mental and cerebral processes and is fully explicable in terms of the laws already known to science.

[725] All phenomena which the spiritualists claim as evidence of the activity of spirits are connected with the presence of certain persons, the mediums themselves. I was never able to observe happenings alleged to be "spiritual" in places or on occasions when no medium was present. Mediums are as a rule slightly abnormal mentally. Frau Rothe, for example, although she could not be declared *non compos mentis* by forensic psychiatrists, nevertheless exhibited a number of hysterical symptoms. Seven of my mediums showed slight symptoms of hysteria (which, incidentally, are extraordinarily common in other walks of life too). One medium was an American swindler whose abnormality consisted chiefly in his impudence. The other seven acted in good faith. Only one of them, a woman of middle age, was born with her gifts; she had suffered since earliest childhood from alterations of consciousness (frequent and slightly hysterical twilight states). She made a virtue of necessity, induced the change of consciousness herself by auto-suggestion, and in this state of auto-hypnosis was able to prophesy. The other mediums discovered their gift only through social contacts and then cultivated it at spiritualistic séances, which is not particularly difficult. One can, with a few skillful suggestions, teach a remarkably

high percentage of people, especially women, the simple spiritualistic manipulations, table-turning for instance, and, less commonly, automatic writing.

[726] The ordinary phenomena met with in mediums are table-turning, automatic writing, and speaking in a trance.

[727] Table-turning consists in one or more persons laying their hands on a table that can move easily. After a time—a couple of minutes to an hour) the table begins to move, making turning or rocking movements. This phenomenon can be observed in the case of all objects that are touched. The automatically swinging pendulum and the divining rod are based on the same principle. It was, then, a very childish hypothesis to assume, as in earlier decades, that the objects touched moved of themselves, like living things. If a fairly heavy object is chosen, and one feels the arm muscles of the medium while the object is moving, the muscular tension is immediately apparent, and hence also the effort of the medium to move the object. The only remarkable thing is that the mediums assert they feel nothing of this effort, but, on the contrary, have a definite feeling that the object is moving of its own accord, or else that their arm or hand is moved for them. This psychological phenomenon is strange only to people who know nothing of hypnosis. A hypnotized person can be told that, on waking, he will forget everything that happened under the hypnosis, but that at a certain sign he will, without knowing why, suddenly raise his right arm. Sure enough, on waking, he has forgotten everything; at the sign he raises his right arm, without knowing why—his arm “simply rose up in the air of its own accord.”

[728] Spontaneous phenomena can occasionally be observed in hysterics, for instance the paralysis or peculiar automatic movements of an arm. Either the patients cannot give the reasons for these sudden symptoms, or they give the wrong reasons; for instance, the symptom came from their having caught cold, or from over-strain. One has only to hypnotize the patient in order to discover the real reason and the significance of the symptom. For instance, a young girl wakes up in the morning to find that her right arm is paralysed. She rushes in terror to the doctor and tells him she doesn't know how it happened, she must obviously have overstrained herself doing the housework the day before. That is the only reason she can think of. Under hypnosis it turns out that the day before she had a violent quarrel with her parents, and that her father grabbed her by the right arm and pushed her out of the door. The paralysis of the arm is now clear; it is connected with the unconscious memory of yesterday's scene, which was not present in her waking consciousness. (The existence of “unconscious ideas” is discussed in my paper “The Reaction-time Ratio in the Association Experiment.”¹¹)

[729] It is evident from these facts that our bodies can easily execute automatic movements whose cause and origin are not known to us. And if science had not drawn our attention to it, we would not know, either, that our arms and hands are

constantly making slight movements, called “intended tremors,” which accompany our thoughts. If, for instance, one vividly imagines a simple geometrical figure, a triangle, say, the tremors of the outstretched hand will also describe a triangle, as can be demonstrated very easily by means of a suitable apparatus. Hence, if we sit down at the table with a lively expectation of automatic movements, the intended tremors will reflect this expectation and gradually cause the table to move. But once we have felt the apparently automatic movement, we are immediately convinced that “the thing works.” The conviction suggestion clouds our judgment and observation, so that we do not notice how the tremors, very slight at first, gradually build up into muscular contractions which then naturally produce stronger and stronger and still more convincing effects.

[730] Now if an ordinary table, whose simple construction we know, can execute movements apparently of its own accord and behave as if it were alive, then human fantasy is quite ready to believe that the cause of the movement is some mystic fluid or even the spirits of the air. And if, as usually happens, the table composes sentences with an intelligible content out of the letters of the alphabet, then it seems proved beyond a doubt that an “alien intelligence” is at work. We know, however, that the initial, automatic tremors are in large measure dependent on our ideas. If they are capable of moving the table, they can equally well guide its movements in such a way that they construct words and sentences out of the alphabet. Nor is it necessary to visualize the sentence beforehand. The unconscious part of the psyche which controls the automatic movements very soon causes an intellectual content to flow into them.¹² As might be expected, the intellectual content is as a rule on a very low level and only in exceptional cases exceeds the intelligence of the medium. A good example of the poverty of “table-talking” is given in Allan Kardec’s *Buch der Medien*.

[731] “Automatic writing” follows the same principles as table-turning. The content of the writing is in no way superior to that of “table-talking.” The same considerations apply to talking in a trance or ecstasy. Instead of the muscles of the arm and hand, it is the muscles of the speech apparatus that start functioning independently. The content of trance communications is naturally on the same level as the products of the other automatisms.

[732] These phenomena are statistically the ones most commonly observed in mediums. Clairvoyance is much rarer. Only two of my mediums had the reputation of being clairvoyant. One of them is a well-known professional, who has already made a fool of herself in various cities in Switzerland. In order to assess her mental state as fairly as possible. I had nearly thirty sittings with her over a period of six months. The results of the investigation, so far as clairvoyance is concerned, can be put very briefly: nothing that quite unquestionably exceeded the normal psychological

capacities was observed. On the other hand, she did in some instances display a remarkably fine gift for unconscious combination. She could combine “petites perceptions” and guesses and evaluate them in a very skilful way, mostly in a state of slight clouding of consciousness. There is nothing supernatural about this state; on the contrary, it is a well-known subject of psychological research.

[733] How delicate is the capacity for unconscious apprehension could be demonstrated experimentally with my second medium. The experiments were conducted as follows. The medium sat opposite me at a small table that stood on a thick soft carpet (to assist greater mobility). Both of us laid our hands on the table. While the medium’s mind was occupied by her engaging in conversation with a third person, I thought intensively of a number between 0 and 10—for instance, 3. The arrangement was that the table had to indicate the number thought of by the same number of tilts. The fact that the number was indicated correctly each time when I kept my hands on the table throughout the experiment is not remarkable. What is remarkable is that in 77 per cent of the cases the correct number was also given when I removed my hands immediately after the first tilt. If my hands did not touch the table at all, there were no correct scores. The results of numerous experiments showed that by means of intended tremors it is possible to communicate a number between 0 and 10 to another person, in such a way that though this person could not recognize the number, he could nevertheless reproduce it by automatic movements. I was able to establish to my satisfaction that the conscious mind of the medium never had any inkling of the number I had communicated. Numbers above 10 were reproduced very uncertainly, sometimes only one of the numerals being given. If I thought of the numbers in Roman instead of Arabic numerals, the results were considerably worse. The aforesaid 77 per cent correct scores applies only to experiments with Arabic numerals. From this one can conclude that my unconscious movements must have communicated a pictorial image of the numbers. The more complicated and less customary images of Roman numerals fared worse, as was also the case with numbers above 10.

[734] I cannot report these experiments without recalling a curious and instructive observation I made one day when all the psychological experiments with the medium went wrong. Even the experiments with numbers failed to come off, until I finally hit on the following expedient: In an experiment conducted along much the same lines. I told the medium that the number I was thinking of 3 was between 2 and 5. I then got the table to answer me a dozen times. The numbers it reproduced with iron consistency were 2, 4, and 5, but never 3; thus indicating, negatively but quite clearly, that the table, or rather the unconscious of the medium, was well aware of the number I was thinking of and avoided it out of mere caprice. The capriciousness of the unconscious is something the spiritualists could tell us a good deal about, only in

their language it would be said that the good spirits had been supplanted by mischievous mocking spirits who had ruined the experiment.

[735] The sensitive apprehension of the unconscious, shown by its capacity to translate another person's tremors into numbers, is a striking but by no means unprecedented fact. There are numerous corroborative examples in the scientific literature. But if the unconscious, as my experiments prove, is capable of registering and reproducing something without the conscious mind knowing anything about it, then the greatest caution is necessary in evaluating clairvoyant performances. Before we jump to the conclusion that thought flies through time and space detached from the brain, we should seek to discover by meticulous psychological investigation the hidden sources of the apparently supernatural knowledge.

[736] On the other hand, any unprejudiced investigator will readily admit that we do not stand today on the pinnacle of all wisdom, and that nature still has infinite possibilities up her sleeve which may be revealed in happier days to come. I shall therefore confine myself to pointing out that the cases I observed of supposed clairvoyance might easily be explained in another and more intelligible way than by the assumption of mystic powers of cognition. The apparently inexplicable cases of clairvoyance I know only by hearsay, or have read of in books.

[737] The same is true of that other great class of spiritualistic manifestations, the *physical* phenomena. Those I saw were reputed to be such, but in fact were not. Generally speaking, among the countless believers in miracles of our days very few will be found who have ever seen anything manifestly supernatural. And among these few there will be still fewer who do not suffer from an overheated imagination and do not replace critical observation by faith. Nevertheless, we are left with a residue of witnesses who ought not to be cavilled at. Among these I would include Crookes.

[738] All human beings are bad observers of things that are unfamiliar to them. Crookes, too, is a human being. There is no universal gift for observation that could claim a high degree of certainty without special training. Human observation achieves something only when trained in a definite field. Take a sensitive observer away from his microscope and turn his attention to wind and weather, and he is more helpless than any hunter or peasant. If we plump a good physicist down in the deceptive, magical darkness of a spiritualistic séance, with hysterical mediums plying their trade with all the incredible refinement many of them have at their command, his observation will be no more acute than a layman's. Everything will then depend on the strength of his prejudice for or against. In this respect the psychic disposition of a man like Crookes would be worth investigating. If as a result of environmental influence and education, or his innate temperament, he is not disinclined to believe in miracles, he will be convinced by the apparition. But if he is disinclined from the

start to believe in miracles, he will remain unconvinced in spite of the apparition, just as did many other people who witnessed similar things with the same medium.

[739] Human observation and reporting are subject to disturbance by countless sources of error, many of which are still quite unknown. For instance, a whole school of experimental psychology is now studying the “psychology of evidence,” that is, the problem of observation and reporting. Professor William Stern,¹³ the founder of this school, has published experiments which show man’s powers of observation in a bad light. And yet Stern’s experiments were conducted on educated people! It seems to me that we must go on working patiently for a few more years in the direction of the Stern school before we tackle the difficult question of the reality of spiritualistic phenomena.

[740] So far as the miraculous reports in the literature are concerned, we should, for all our criticism, never lose sight of the limitations of our knowledge, otherwise something embarrassingly human might happen, making us feel as foolish as the academicians felt over Chladni’s meteors,¹⁴ or the highly respected Bavarian Board of Physicians over the railway.¹⁵ Nevertheless I believe that the present state of affairs gives us reason enough to wait quietly until more impressive physical phenomena put in an appearance. If, after making allowance for conscious and unconscious falsification, self-deception, prejudice, etc., we should still find something positive behind them, then the exact sciences will surely conquer this field by experiment and verification, as has happened in every other realm of human experience. That many spiritualists brag about their “science” and “scientific knowledge” is, of course, irritating nonsense. These people are lacking not only in criticism but in the most elementary knowledge of psychology. At bottom they do not want to be taught any better, but merely to go on believing—surely the naïvest of presumptions in view of our human failings.

FOREWORD TO JUNG: "PHÉNOMÈNES OCCULTES"¹

[741] The essays collected together in this little volume were written over a period of thirty years, the first in 1902 and the last in 1932. The reason why I am bringing them out together is that all three are concerned with certain borderline problems of the human psyche, the question of the soul's existence after death. The first essay gives an account of a young somnambulistic girl who claimed to be in communication with the spirits of the departed. The second essay deals with the problem of dissociation and "part-souls" (or splinter-personalities). The third discusses the psychology of the belief in immortality and the possibility of the continued existence of the soul after death.

[742] The point of view I have adopted is that of modern empirical psychology and the scientific method. Although these essays deal with subjects which usually fall within the province of philosophy or theology, it would be a mistake to suppose that psychology is concerned with the *metaphysical* nature of the problem of immortality. Psychology cannot establish any metaphysical "truths," nor does it try to. It is concerned solely with the *phenomenology of the psyche*. The idea of immortality is a psychic phenomenon that is disseminated over the whole earth. Every "idea" is, from the psychological point of view, a phenomenon, just as is "philosophy" or "theology." For modern psychology, ideas are *entities*, like animals and plants. The scientific method consists in the description of nature. All mythological ideas are *essentially real*, and far older than any philosophy. Like our knowledge of physical nature, they were originally perceptions and experiences. In so far as such ideas are universal, they are symptoms or characteristics or normal exponents of psychic life, which are *naturally* present and need no proof of their "truth." The only question we can profitably discuss is whether they are universal or not. If they are universal, they belong to the natural constituents and normal structure of the psyche. And if by any chance they are not encountered in the conscious mind of a given individual, then they are present in the unconscious and the case is an abnormal one. The fewer of these universal ideas are found in consciousness, the more of them there will be in the unconscious, and the greater will be their influence on the conscious mind. This state of things already bears some resemblance to a neurotic disturbance.

[743] It is normal to think about immortality, and abnormal not to do so or not to bother about it. If everybody eats salt, then that is the normal thing to do, and it is abnormal not to. But this tells us nothing about the "rightness" of eating salt or of the idea of immortality. That is a question which strictly speaking has nothing to do with

psychology. Immortality cannot be proved any more than can the existence of God, either philosophically or empirically. We know that salt is indispensable for our physiological health. We do not eat salt for this reason, however, but because food with salt in it tastes better. We can easily imagine that long before there was any philosophy human beings had instinctively found out what ideas were necessary for the normal functioning of the psyche. Only a rather stupid mind will try to go beyond that, and to venture an opinion on whether immortality does or does not exist. This question cannot be asked for the simple reason that it cannot be discussed. More important, it misses the essential point, which is the functional value of the idea as such.

[744] If a person does not “believe” in salt, it is up to the doctor to tell him that salt is necessary for physiological health. Equally, it seems to me that the doctor of the soul should not go along with the fashionable stupidities but should remind his patient what the normal structural elements of the psyche are. For reasons of psychic hygiene, it would be better not to forget these original and universal ideas; and wherever they have disappeared, from neglect or intellectual bigotry, we should reconstruct them as quickly as we can regardless of “philosophical” proofs for or against (which are impossible anyway). In general, the heart seems to have a more reliable memory for what benefits the psyche than does the head, which has a rather unhealthy tendency to lead an “abstract” existence, and easily forgets that its consciousness is snuffed out the moment the heart fails in its duty.

[745] Ideas are not just counters used by the calculating mind; they are also golden vessels full of living feeling. “Freedom” is not a mere abstraction, it is also an emotion. Reason becomes unreason when separated from the heart, and a psychic life void of universal ideas sickens from undernourishment. The Buddha said: “These four are the foodstuffs, ye bhikkus, which sustain the creatures that are born, and benefit the creatures that seek rebirth. The first is edible food, coarse or fine; touch is the second; the thinking capacity of the mind is the third; and the fourth is consciousness.”²

PSYCHOLOGY AND SPIRITUALISM¹

[746] The reader should not casually lay this book aside on discovering that it is about “Invisibles,” that is to say about spirits, on the assumption that it belongs to the literature of spiritualism. One can very well read the book without resorting to any such hypothesis or theory, and take it simply as a report of psychological facts or a continuous series of communications from the unconscious—which is, indeed, what it is really about. Even spirits appear to be psychic phenomena whose origins lie in the unconscious. At all events, the “Invisibles” who are the source of information in this book are shadowy personifications of unconscious contents, conforming to the rule that activated portions of the unconscious assume the character of *personalities* when they are perceived by the conscious mind. For this reason, the voices heard by the insane seem to belong to definite personalities who can often be identified, and personal intentions are attributed to them. And in fact, if the observer is able—though this is not always easy—to collect together a fair number of these verbal hallucinations, he will discover in them something very like motives and intentions of a personal character.

[747] The same is true to an even greater degree of the “controls” in mediumistic séances who make the “communications.” Everything in our psyche has to begin with a personal character, and one must push one’s investigations very far before one comes across elements that are no longer personal. The “I” or “we” of these communications has a merely grammatical significance and is never proof of the existence of a spirit, but only of the physical presence of the medium or mediums. In dealing with “proofs of identity,” such as are offered in this book, one must remember that proofs of this kind would seem to be theoretically impossible considering the enormous number of possible sources of error. We know for a certainty that the unconscious is capable of subliminal perceptions and is a treasure house of lost memories. In addition, it has been proved by experiment that time and space are *relative* for the unconscious, so that unconscious perception, not being impeded by the space-time barrier, can obtain experiences to which the conscious mind has no access. In this connection I would refer to the experiments conducted at Duke University and other places.²

[748] Considering all this, the proof of identity seems to be a forlorn hope, in theory anyway. In practice, however, things are rather different because cases actually occur which are so overwhelmingly impressive that they are absolutely convincing to those concerned. Even though our critical arguments may cast doubt on every single case,

there is not a single argument that could prove that spirits do not exist. In this regard, therefore, we must rest content with a “non liquet.” Those who are convinced of the reality of spirits should know that this is a subjective opinion which can be attacked on any number of grounds. Those who are not convinced should beware of naïvely assuming that the whole question of spirits and ghosts has been settled and that all manifestations of this kind are meaningless swindles. This is not so at all. These phenomena exist in their own right, regardless of the way they are interpreted, and it is beyond all doubt that they are genuine manifestations of the unconscious. The communications of “spirits” are *statements about the unconscious psyche*, provided that they are really spontaneous and are not cooked up by the conscious mind. They have this in common with dreams; for dreams, too, are statements about the unconscious, which is why the psychotherapist uses them as a first-class source of information.

[749] *The Unobstructed Universe* may therefore be regarded as offering valuable information about the unconscious and its ways. It differs very favourably from the usual run of spiritualistic communications in that it eschews all edifying verbiage and concentrates instead on certain general ideas. This pleasing difference may be attributable to the happy circumstance that the real begetter of the book is the medium Betty, the deceased wife of the author. It is her “spirit” that pervades the book. We are familiar with her personality from Mr. White’s earlier books,³ and we know how great an educative influence she had on all those around her, constellating in their unconscious all the things that come to light in these communications.

[750] The educative intention behind Betty’s activity does not differ essentially from the general tenor of spiritualistic literature. The “spirits” strive to develop man’s consciousness and to unite it with the unconscious, and Betty, on her own admission, pursues the same aim. It is interesting to note that the beginnings of American spiritualism coincided with the growth of scientific materialism in the middle of the nineteenth century. Spiritualism in all its forms therefore has a *compensatory* significance. Nor should it be forgotten that a number of highly competent scientists, doctors, and philosophers have vouched for the truth of certain phenomena which demonstrate the very peculiar effect the psyche has upon matter. Among them were Friedrich Zöllner, William Crookes, Alfred Richet, Camille Flammarion, Giovanni Schiaparelli, Sir Oliver Lodge, and our Zurich psychiatrist Eugen Bleuler, not to mention a large number of less well-known names. Although I have not distinguished myself by any original researches in this field, I do not hesitate to declare that I have observed a sufficient number of such phenomena to be completely convinced of their reality. To me they are inexplicable, and I am therefore unable to decide in favour of any of the usual interpretations.

[751] Although I do not wish to prejudice the reader of this book, I cannot refrain from drawing attention to some of the issues it raises. What, above all, seems to me worth mentioning—especially in view of the fact that the author has no knowledge of modern psychology—is that the “Invisibles” favour an energetic conception of the psyche which has much in common with recent psychological findings. The analogy is to be found in the idea of “frequency.” But here we come upon a difference that should not be overlooked. For whereas the psychologist supposes that consciousness has a higher energy than the unconscious, the “Invisibles” attribute to the spirit of the departed, i.e., to a personified unconscious content) a higher “frequency” than to the living psyche. One should not, however, attach too much importance to the fact that the concept of energy is made use of in both cases, since this is a fundamental category of thought in all the modern sciences.

[752] The “Invisibles” further assert that our world of consciousness and the “Beyond” together form a single cosmos, with the result that the dead are not in a different place from the living. There is only a difference in their “frequencies,” which might be likened to the revolutions of a propeller: at low speeds the blades are visible, but at high speeds they disappear. In psychological terms this would mean that the conscious and the unconscious psyche are one, but are separated by different amounts of energy. Science can agree with this statement, although it cannot accept the claim that the unconscious possesses a higher energy since this is not borne out by experience.

[753] According to the “Invisibles,” the “Beyond” is this same cosmos but without the limitations imposed on mortal man by space and time. Hence it is called “the unobstructed universe.” Our world is contained in this higher order and owes its existence principally to the fact that the corporeal man has a low “frequency,” thanks to which the limiting factors of space and time become operative. The world without limitations is called “Orthos,” which means the “right” or “true” world. This tells us clearly enough what kind of significance is imputed to the “Beyond,” though it must be emphasized that this does not imply a devaluation of our world. I am reminded of the philosophical riddle which my Arab dragon-man asked me when visiting the tombs of the Khalifs in Cairo. “Which man is the cleverer: the one who builds his house where he will be for the longest time, or the one who builds it where he will be only temporarily?” Betty is in no doubt that this limited life should be lived as fully as possible, because the attainment of maximum consciousness while still in this world is an essential condition for the coming life in “Orthos.” She is thus in agreement not only with the general trend of spiritualistic philosophy, but also with Plato, who regarded philosophy as a preparation for death.

[754] Modern psychology can affirm that for many people this problem arises in the second half of life, when the unconscious often makes itself felt in a very insistent

way. The unconscious is the land of dreams, and according to the primitive view the land of dreams is also the land of the dead and of the ancestors. From all we know about it, the unconscious does in fact seem to be relatively independent of space and time, nor is there anything objectionable in the idea that consciousness is surrounded by the sea of the unconscious, just as this world is contained in "Orthos." The unconscious is of unknown extent and is possibly of greater importance than consciousness. At any rate, the role which consciousness plays in the life of primitives and primates is insignificant compared with that of the unconscious. The events in our modern world, as we see humanity blindly staggering from one catastrophe to the next, are not calculated to strengthen anyone's belief in the value of consciousness and the freedom of the will. Consciousness *should* of course be of supreme importance, for it is the only guarantee of freedom and alone makes it possible for us to avoid disaster. But this, it seems, must remain for the present a pious hope.

[755] Betty's aim is to extend consciousness as far as possible by uniting it with "Orthos." To this end it must be trained to listen to the unconscious psyche in order to bring about the collaboration of the "Invisibles." The aims of modern psychotherapy are similar: it too endeavours to compensate the onesidedness and narrowness of the conscious mind by deepening its knowledge of the unconscious.

[756] The similarity of aim should not, however, lead us to overlook a profound difference of viewpoint. The psychology of the "Betty Books" differs in no essential respect from the primitive view of the world, where the contents of the unconscious are all projected into external objects. What appears to the primitive to be a "spirit" may on a more conscious level be an abstract thought, just as the gods of antiquity turned into philosophical ideas at the beginning of our era. This primitive projection of psychological factors is common to both spiritualism and theosophy. The advantage of projection is obvious: the projected content is visibly "there" in the object and calls for no further reflection. But since the projection does bring the unconscious a bit nearer to consciousness, it is at least better than nothing. Mr. White's book certainly makes us think, but the kind of thinking it caters to is not psychological; it is mechanistic, and this is of little help when we are faced with the task of integrating projections. Mechanistic thinking is one of the many Americanisms that stamp the book as a typical product and leave one in no doubt as to its origin. But it is well worth while getting to know this side of the American psyche, for the world will hear a great deal more of it in times to come.

July 1948

FOREWORD TO MOSER: "SPUK: IRRGLAUBE ODER WAHRGLAUBE?"¹

[757] The author has asked me for a few introductory words to her book. It gives me all the more pleasure to comply with her request as her previous book on occultism,² written with great care and knowledge of the subject, is still fresh in my memory. I welcome the appearance of this new book, a copiously documented collection of parapsychological experiences, as a valuable contribution to psychological literature in general. Extraordinary and mysterious stories are not necessarily always lies and fantasies. Many "ingenious, curious, and edifying tales" were known to previous centuries, among them observations whose scientific validity has since been confirmed. The modern psychological description of man as a totality had its precursors in the numerous biographical accounts of unusual people such as somnambulists and the like at the beginning of the nineteenth century. Indeed, though we owe the discovery of the unconscious to these old pre-scientific observations, our investigation of parapsychological phenomena is still in its infancy. We do not yet know the full range of the territory under discussion. Hence a collection of observations and of reliable material performs a very valuable service. The collector must certainly have courage and an unshakable purpose if he is not to be intimidated by the difficulties, handicaps, and possibilities of error that beset such an undertaking, and the reader, too, must summon up sufficient interest and patience to allow this sometimes disconcerting material to work upon him objectively, regardless of his prejudices. In this vast and shadowy region, where everything seems possible and nothing believable, one must oneself have observed many strange happenings and in addition heard, read, and if possible tested many stories by examining their witnesses in order to form an even moderately sure judgment.

[758] In spite of such advances as the founding of the British and American Society for Psychical Research and the existence of a considerable and in part well-documented literature, a prejudice is still rampant even in the best informed circles, and reports of this kind meet with a mistrust which is only partially justified. It looks as though Kant will be proved right for a long time to come when he wrote nearly two hundred years ago: "Stories of this kind will have at any time only secret believers, while publicly they are rejected by the prevalent fashion of disbelief."³ He himself reserved judgment in the following words: "The same ignorance makes me so bold as to absolutely deny the truth of the various ghost stories, and yet with the common, although queer, reservation that while I doubt any one of them, still I have

a certain faith in the whole of them taken together.”⁴ One could wish that very many of our bigots would take note of this wise position adopted by a great thinker.

[759] I am afraid this will not come about so easily, for our rationalistic prejudice is grounded—*lucus a non lucendo*—not on reason but on something far deeper and more archaic, namely on a primitive instinct to which Goethe referred when he said in *Faust*: “Summon not the well-known throng ...” I once had a valuable opportunity to observe this instinct at work. It was while I was with a tribe on Mount Elgon, in East Africa, most of whom had never come into contact with the white man. Once, during a palaver, I incautiously uttered the word *selelteni*, which means “ghosts.” Suddenly a deathly silence fell on the assembly. The men glanced away, looked in all directions, and some of them made off. My Somali headman and the chief confabulated together, and then the headman whispered in my ear: “What did you say that for? Now you’ll have to break up the palaver.” This taught me that one must never mention ghosts on any account. The same primitive fear of ghosts is still deep in our bones, but it is unconscious. Rationalism and superstition are complementary. It is a psychological rule that the brighter the light, the blacker the shadow; in other words, the more rationalistic we are in our conscious minds, the more alive becomes the spectral world of the unconscious. And it is indeed obvious that rationality is in large measure an apotropaic defence against superstition, which is everpresent and unavoidable. The daemonic world of primitives is only a few generations away from us, and the things that have happened and still go on happening in the dictator states teach us how terrifyingly close it is. I must constantly remind myself that the last witch was burned in Europe in the year my grandfather was born.

[760] The widespread prejudice against the factual reports discussed in this book shows all the symptoms of the primitive fear of ghosts. Even educated people who should know better often advance the most nonsensical arguments, tie themselves in knots and deny the evidence of their own eyes. They will put their names to reports of séances and then—as has actually happened more than once—withdraw their signatures afterwards, because what they have witnessed and corroborated is nevertheless impossible—as though anyone knew exactly what is impossible and what is not!

[761] Ghost stories and spiritualistic phenomena practically never prove what they seem to. They offer no proof of the immortality of the soul, which for obvious reasons is incapable of proof. But they are of interest to the psychologist from several points of view. They provide information about things the layman knows nothing of, such as the exteriorization of unconscious processes, about their content, and about the possible sources of parapsychological phenomena. They are of particular importance in investigating the localization of the unconscious and the phenomenon of synchronicity, which points to a relativation of space and time and hence also of

matter. It is true that with the help of the statistical method existence of such effects can be proved, as Rhine and other investigators have done. But the individual nature of the more complex phenomena of this kind forbids the use of the statistical method, since this stands in a complementary relation to synchronicity and necessarily destroys the latter phenomenon, which the statistician is bound to discount as due to chance. We are thus entirely dependent on well observed and well authenticated individual cases. The psychologist can only bid a hearty welcome to any new crop of objective reports.

[762] The author has put together an impressive collection of factual material in this book. It differs from other collections of the kind by its careful and detailed documentation, and thus gives the reader a total impression of the situation which he often looks for in vain in other reports of this nature. Although ghosts exhibit certain universal features they nevertheless appear in individual forms and under conditions which are infinitely varied and of especial importance for the investigator. The present collection provides the most valuable information in just this respect.

[763] The question discussed here is a weighty one for the future. Science has only just begun to take a serious interest in the human psyche and, more particularly, in the unconscious. The wide realm of psychic phenomena also includes parapsychology, which is opening undreamt-of vistas before our eyes. It is high time humanity took cognizance of the nature of the psyche, for it is becoming more and more evident that the greatest danger which threatens man comes from his own psyche and hence from that part of the empirical world we know the least about. Psychology needs a tremendous widening of its horizon. The present book is a milestone on the long road to knowledge of the psychic nature of man.

April 1950

Jung's Contribution⁵

[764] In the summer of 1920 I went to London, at the invitation of Dr. X, to give some lectures. My colleague told me that, in expectation of my visit, he had found a suitable weekend place for the summer. This, he said, had not been so easy, because every thing had already been let for the summer holidays, or else was so exorbitantly expensive or unattractive that he had almost given up hope. But finally, by a lucky change, he had found a charming cottage that was just right for us, and at a ridiculously low price. In actual fact it turned out to be a most attractive old farmhouse in Buckinghamshire, as we saw when we went there at the end of our first week of work, on a Friday evening. Dr. X had engaged a girl from the neighbouring village to cook for us, and a friend of hers would come in the afternoons as a voluntary help. The house was roomy, two-storeyed, and built in the shape of a right

angle. One of these wings was quite sufficient for us. On the ground floor there was a conservatory leading into the garden; then a kitchen, dining-room, and drawing-room. On the top floor a corridor ran from the conservatory steps through the middle of the house to a large bedroom, which took up the whole front of the wing. This was my room. It had windows facing east and west, and a fireplace in the front wall (north). To the left of the door stood a bed, opposite the fireplace a big old-fashioned chest of drawers, and to the right a wardrobe and a table. This, together with a few chairs, was all the furniture. On either side of the corridor was a row of bedrooms, which were used by Dr. X and occasional guests.

[765] The first night, tired from the strenuous work of the week, I slept well. We spent the next day walking and talking. That evening, feeling rather tired, I went to bed at 11 o'clock, but did not get beyond the point of drowsing. I only fell into a kind of torpor, which was unpleasant because I felt I was unable to move. Also it seemed to me that the air had become stuffy, and that there was an indefinable, nasty smell in the room. I thought I had forgotten to open the windows. Finally, in spite of my torpor, I was driven to light a candle: both windows were open, and a night wind blew softly through the room, filling it with the flowery scents of high summer. There was no trace of the bad smell. I remained half awake in my peculiar condition, until I glimpsed the first pale light of dawn through the east window. At this moment the torpor dropped away from me like magic, and I fell into a deep sleep from which I awoke only towards nine o'clock.

[766] On Sunday evening I mentioned in passing to Dr. X that I had slept remarkably badly the night before. He recommended me to drink a bottle of beer, which I did. But when I went to bed the same thing happened: I could not get beyond the point of drowsing. Both windows were open. The air was fresh to begin with, but after about half an hour it seemed to turn bad; it became stale and fuggy, and finally somehow repulsive. It was hard to identify the smell, despite my efforts to establish its nature. The only thing that came into my head was that there was something sickly about it. I pursued this clue through all the memories of smells that a man can collect in eight years of work at a psychiatric clinic. Suddenly I hit on the memory of an old woman who was suffering from an open carcinoma. This was quite unmistakably the same sickly smell I had so often noticed in her room.

[767] As a psychologist, I wondered what might be the cause of this peculiar olfactory hallucination. But I was unable to discover any convincing connection between it and my present state of consciousness. I only felt very uncomfortable because my torpor seemed to paralyze me. In the end I could not think any more, and fell into a torpid doze. Suddenly I heard the noise of water dripping. "Didn't I turn off the tap properly?" I thought. "But of course, there's no running water in the room—so it's obviously raining—yet today was so fine." Meanwhile the dripping went on

regularly, one drop every two seconds. I imagined a little pool of water to the left of my bed, near the chest of drawers. "Then the roof must leak." I thought. Finally, with a heroic effort, so it seemed to me, I lit the candle and went over to the chest of drawers. There was no water on the floor, and no damp spot on the plaster ceiling. Only then did I look out of the window: it was a clear, starry night. The dripping still continued. I could make out a place on the floor, about eighteen inches from the chest of drawers, where the sound came from. I could have touched it with my hand. All at once the dripping stopped and did not come back. Towards three o'clock, at the first light of dawn. I fell into a deep sleep. No—I have heard death-watch beetles. The ticking noise they make is sharper. This was a duller sound, exactly what would be made by drops of water falling from the ceiling.

[768] I was annoyed with myself, and not exactly refreshed by this weekend. But I said nothing to Dr. X. The next weekend, after a busy and eventful week. I did not think at all about my previous experience. Yet hardly had I been in bed for half an hour than everything was there as before: the torpor, the repulsive smell, the dripping. And this time there was something else: something brushed along the walls, the furniture creaked now here and now there, there were rustlings in the corners. A strange restlessness was in the air. I thought it was the wind, lit the candle and went to shut the windows. But the night was still, there was no breath of wind. So long as the light was on, the air was fresh and no noise could be heard. But the moment I blew out the candle, the torpor slowly returned, the air became fuggy, and the creakings and rustlings began again. I thought I must have noises in my ear, but at three o'clock in the morning they stopped as promptly as before.

[769] The next evening I tried my luck again with a bottle of beer. I had always slept well in London and could not imagine what could give me insomnia in this quiet and peaceful spot. During the night the same phenomena were repeated, but in intensified form. The thought now occurred to me that they must be parapsychological. I knew that problems of which people are unconscious can give rise to exteriorization phenomena, because constellated unconscious contents often have a tendency to manifest themselves outwardly somehow or other. But I knew the problems of the present occupants of the house very well, and could discover nothing that would account for the exteriorizations. The next day I asked the others how they had slept. They all said they had slept wonderfully.

[770] The third night it was even worse. There were loud knocking noises, and I had the impression that an animal, about the size of a dog, was rushing round the room in a panic. As usual, the hubbub stopped abruptly with the first streak of light in the east.

[771] The phenomena grew still more intense during the following weekend. The rustling became a fearful racket, like the roaring of a storm. Sounds of knocking

came also from outside in the form of dull blows, as though somebody were banging on the brick walls with a muffled hammer. Several times I had to assure myself that there was no storm, and that nobody was banging on the walls from outside.

[772] The next weekend, the fourth, I cautiously suggested to my host that the house might be haunted, and that this would explain the surprisingly low rent. Naturally he laughed at me, although he was as much at a loss as I about my insomnia. It had also struck me how quickly the two girls cleared away after dinner every evening, and always left the house long before sundown. By eight o'clock there was no girl to be seen. I jokingly remarked to the girl who did the cooking that she must be afraid of us if she had herself fetched every evening by her friend and was then in such a hurry to get home. She laughed and said that she wasn't at all afraid of the gentlemen, but that nothing would induce her to stay a moment in this house alone, and certainly not after sunset. "What's the matter with it?" I asked. "Why, it's haunted, didn't you know? That's the reason why it was going so cheap. Nobody's ever stuck it here." It had been like that as long as she could remember. But I could get nothing out of her about the origin of the rumour. Her friend emphatically confirmed everything she had said.

[773] As I was a guest, I naturally couldn't make further inquiries in the village. My host was sceptical, but he was willing to give the house a thorough looking over. We found nothing remarkable until we came to the attic. There, between the two wings of the house, we discovered a dividing wall, and in it a comparatively new door, about half an inch thick, with a heavy lock and two huge bolts, that shut off our wing from the unoccupied part. The girls did not know of the existence of this door. It presented something of a puzzle because the two wings communicated with one another both on the ground floor and on the first floor. There were no rooms in the attic to be shut off, and no signs of use. The purpose of the door seemed inexplicable.

[774] The fifth weekend was so unbearable that I asked my host to give me another room. This is what had happened: it was a beautiful moonlight night, with no wind; in the room there were rustlings, creakings, and hangings; from outside, blows rained on the walls. I had the feeling there was something near me, and opened my eyes. There, beside me on the pillow, I saw the head of an old woman, and the right eye, wide open, glared at me. The left half of the face was missing below the eye. The sight of it was so sudden and unexpected that I leapt out of bed with one bound, lit the candle, and spent the rest of the night in an armchair. The next day I moved into the adjoining room, where I slept splendidly and was no longer disturbed during this or the following weekend.

[775] I told my host that I was convinced the house was haunted, but he dismissed this explanation with smiling scepticism. His attitude, understandable though it was, annoyed me somewhat, for I had to admit that my health had suffered under these

experiences. I felt unnaturally fatigued, as I had never felt before. I therefore challenged Dr. X to try sleeping in the haunted room himself. He agreed to this, and gave me his word that he would send me an honest report of his observations. He would go to the house alone and spend the weekend there so as to give me a “fair chance.”

[776] Next morning I left. Ten days later I had a letter from Dr. X. He had spent the weekend alone in the cottage. In the evening it was very quiet, and he thought it was not absolutely necessary to go up to the first floor. The ghost, after all, could manifest itself anywhere in the house, if there was one. So he set up his camp bed in the conservatory, and as the cottage really was rather lonely, he took a loaded shotgun to bed with him. Everything was deathly still. He did not feel altogether at ease, but nevertheless almost succeeded in falling asleep after a time. Suddenly it seemed to him that he heard footsteps in the corridor. He immediately struck a light and flung open the door, but there was nothing to be seen. He went back grumpily to bed, thinking I had been a fool. But it was not long before he again heard footsteps, and to his discomfiture he discovered that the door lacked a key. He rammed a chair against the door, with its back under the lock, and returned to bed. Soon afterwards he again heard footsteps, which stopped just in front of the door; the chair creaked, as though somebody was pushing against the door from the other side. He then set up his bed in the garden, and there he slept very well. The next night he again put his bed in the garden, but at one o'clock it started to rain, so he shoved the head of the bed under the eaves of the conservatory and covered the foot with a waterproof blanket. In this way he slept peacefully. But nothing in the world would induce him to sleep again in the conservatory. He had now given up the cottage.

[777] A little later I heard from Dr. X that the owner had had the cottage pulled down, since it was unsaleable and scared away all tenants. Unfortunately I no longer have the original report, but its contents are stamped indelibly on my mind. It gave me considerable satisfaction after my colleague had laughed so loudly at my fear of ghosts.

*

[778] I would like to make the following remarks by way of summing up. I can find no explanation of the dripping noise. I was fully awake and examined the floor carefully. I consider it out of the question that it was a delusion of the senses. As to the rustling and creaking, I think they were probably not objective noises, but noises in the ear which seemed to me to be occurring objectively in the room. In my peculiar hypnoid state they appeared exaggeratedly loud. I am not at all sure that the knocking noises, either, were objective. They could just as well have been heartbeats that seemed to me to come from outside. My torpor was associated with an inner excitation probably

corresponding to fear. Of this fear I was unconscious until the moment of the vision—only then did it break through into consciousness. The vision had the character of a hypnagogic hallucination and was probably a reconstruction of the memory of the old woman with carcinoma.

[779] Coming now to the olfactory hallucination, I had the impression that my presence in the room gradually activated something that was somehow connected with the walls. It seemed to me that the dog rushing round in a panic represented my intuition. Common speech links intuition with the nose: I had “smelt” something. If the olfactory organ in man were not so hopelessly degenerate, but as highly developed as a dog’s, I would have undoubtedly have had a clearer idea of the persons who had lived in the room earlier. Primitive medicine-men can not only smell out a thief, they also “smell” spirits and ghosts.

[780] The hypnoid catalepsy that each time was associated with these phenomena was the equivalent of intense concentration, the object of which was a subliminal and therefore “fascinating” olfactory perception. The two things together bear some resemblance to the physical and psychic state of a pointer that has picked up the scent. The source of the fascination, however, seems to me to have been of a peculiar nature, which is not sufficiently explained by any substance emitting a smell. The smell may have “embodied” a psychic situation of an excitatory nature and carried it across to the percipient. This is by no means impossible when we consider the extraordinary importance of the sense of smell in animals. It is also conceivable that intuition in man has taken the place of the world of smells that were lost to him with the degeneration of the olfactory organ. The effect of intuition on man is indeed very similar to the instant fascination which smells have for animals. I myself have had a number of experiences in which “psychic smells,” or olfactory hallucinations, turned out to be subliminal intuitions which I was able to verify afterwards.

[781] This hypothesis naturally does not pretend to explain all ghost phenomena, but at most a certain category of them. I have heard and read a great many ghost stories, and among them are a few that could very well be explained in this way. For instance, there are all those stories of ghosts haunting rooms where a murder was committed. In one case, bloodstains were still visible under the carpet. A dog would surely have smelt the blood and perhaps recognized it as human, and if he possessed a human imagination he would also have been able to reconstruct the essential features of the crime. Our unconscious, which possesses very much more subtle powers of perception and reconstruction than our conscious minds, could do the same thing and project a visionary picture of the psychic situation that excited it. For example, a relative once told me that, when stopping at a hotel on a journey abroad, he had a fearful nightmare of a woman being murdered in his room. The next morning he discovered that on the night before his arrival a woman had in fact been

murdered there. These remarks are only meant to show that parapsychology would do well to take account of the modern psychology of the unconscious.

FOREWORD TO JAFFÉ: “APPARITIONS AND PRECOGNITION”¹

[782] The author of this book has already made a name for herself by her valuable contributions to the literature of analytical psychology. Here she tells of strange tales which incur the odium of superstition and are therefore exchanged only in secret. They were lured into the light of day by a questionnaire sent out by the *Schweizerischer Beobachter*, which can thereby claim to have rendered no small service to the public. The mass of material that came in arrived first at my address. Since my age and my evergrowing preoccupation with other matters did not allow me to burden myself with further work, the task of sorting out such a collection and submitting it to psychological evaluation could not have been placed in worthier hands than those of the author. She had displayed so much psychological tact, understanding and insight in her approach to a related theme—an interpretation of E.T.A. Hoffmann’s story “The Golden Pot”²—that I never hesitated in my choice.

[783] Curiously enough, the problem of wonder tales as they are currently told—enlightenment or no enlightenment—has never been approached from the psychological side. I naturally don’t count mythology, although people are generally of the opinion that mythology is essentially history and no longer happens nowadays. As a psychic phenomenon of the present, it is considered merely a hunting-ground for economics. Nevertheless, ghost stories, warning visions, and other strange happenings are constantly being reported, and the number of people to whom something once “happened” is surprisingly large. Moreover, despite the disapproving silence of the “enlightened,” it has not remained hidden from the wider public that for some time now there has been a serious science which goes by the name of “parapsychology.” This fact may have helped to encourage the popular response to the questionnaire.

[784] One of the most notable things that came to light is the fact that among the Swiss, who are commonly regarded as stolid, unimaginative, rationalistic and materialistic, there are just as many ghost stories and suchlike as, say, in England or Ireland. Indeed, as I know from my own experience and that of other investigators, magic as practised in the Middle Ages and harking back to much remoter times has by no means died out, but still flourishes today as rampantly as it did centuries ago. One doesn’t speak of these things, however, They simply happen, and the intellectuals know nothing of them—for intellectuals know neither themselves nor people as they really are. In the world of the latter, without their being conscious of it, the life of the centuries lives on, and things are continually happening that have

accompanied human life from time immemorial: premonitions, foreknowledge, second sight, hauntings, ghosts, return of the dead, bewitchings, sorcery, magic spells, etc.

[785] Naturally enough our scientific age wants to know whether such things are “true,” without taking into account what the nature of any such proof would have to be and how it could be furnished. For this purpose the events in question must be looked at squarely and soberly, and it generally turns out that the most exciting stories vanish into thin air and what is left over is “not worth talking about.” Nobody thinks of asking the fundamental question: what is the real reason why the same old stories are experienced and repeated over and over again, without losing any of their prestige? On the contrary, they return with their youthful vitality constantly renewed, fresh as on the first day.

[786] The author has made it her task to take these tales for what they are, that is, as *psychic facts*, and not to pooh-pooh them because they do not fit into our scheme of things. She has therefore logically left aside the question of truth, as has long since been done in mythology, and instead has tried to inquire into the psychological questions: Exactly *who* is it that sees a ghost? Under what psychic conditions does he see it? What does a ghost signify when examined for its content, i.e., as a symbol?

[787] She understands the art of leaving the story just as it is, with all the trimmings that are so offensive to the rationalist. In this way the *twilight atmosphere* that is so essential to the story is preserved. An integral component of any nocturnal, numinous experience is the dimming of consciousness, the feeling that one is in the grip of something greater than oneself, the impossibility of exercising criticism, and the paralysis of the will. Under the impact of the experience reason evaporates and another power spontaneously takes control—a most singular feeling which one willy-nilly hoards up as a secret treasure no matter how much one’s reason may protest. That, indeed, is the uncomprehended purpose of the experience—to make us feel the overpowering presence of a mystery.

[788] The author has succeeded in preserving the total character of such experiences, despite the refractory nature of the reports, and in making it an object of investigation. Anyone who expects an answer to the question of parapsychological truth will be disappointed. The psychologist is little concerned here with what kind of facts can be established in the conventional sense; all that matters to him is whether a person will vouch for the authenticity of his experience regardless of all interpretations. The reports leave no doubt about this; moreover, in most cases their authenticity is confirmed by independent parallel stories. It cannot be doubted that such reports are found at all times and places. Hence there is no sufficient reason for doubting the veracity of individual reports. Doubt is justified only when it is a

question of a deliberate lie. The number of such cases is increasingly small, for the authors of such falsifications are too ignorant to be able to lie properly.

[789] The psychology of the unconscious has thrown so many beams of light into other dark corners that we would expect it to elucidate also the obscure world of wonder tales eternally young. From the copious material assembled in this book those conversant with depth psychology will surely gain new and significant insights which merit the greatest attention. I can recommend it to all those who know how to value things that break through the monotony of daily life with salutary effects, (sometimes!) shaking our certitudes and lending wings to the imagination.

August 1957

V

THE PSYCHOGENESIS OF MENTAL DISEASE

(related to Volume 3 of the Collected Works)

THE PRESENT STATUS OF APPLIED PSYCHOLOGY¹

In German Switzerland

[790] Though psychology is not taught in either Basel or Fribourg, a psychological institute has just been opened in Bern, under the direction of Professor Dürr. In the winter semester 1907 he has given a course on general psychology and another on paedagogics based on psychology, as well as an introduction to experimental psychology.

[791] As to Zurich: Professor Schumann is giving a course on Special Psychology and conducting a seminar for advanced students at the University laboratory for experimental psychology. — Privatdocent Wreschner² is lecturing this winter on physiology and psychology of the voice and language and conducting an introductory course (with demonstrations) on experimental psychology at the psychological laboratory. — At the psychological laboratory of the University's psychiatric clinic, established 1906, I am holding a seminar for advanced students. The programme includes normal and pathological psychology.

[792] As to associations concerned with psychology, there is nothing in Bern or Basel. (Fribourg need not be mentioned at all.)

[793] In Zurich the following have existed for some years:

1. An association for legal psychiatry, whose chairman I have been since early 1907.³

2. There also has existed for many years a psychological-neurological society where an occasional psychological lecture may be heard. The chairman is Professor von Monakow.⁴

3. In addition, in the autumn of 1907 a Society for Freudian Researches was founded (with ca. 20 members). The chairman is Professor Bleuler.⁵

C. G. JUNG (Burghölzli-Zurich)

ON DEMENTIA PRAECOX¹

[794] The depotentiation of the association process or *abaissement du niveau mental*, which consequently has a downright dreamlike quality, seems to indicate that a pathogenic agent [*Noxe*] contributes to dementia praecox which is absent in, say, hysteria. The characteristics of the *abaissement* were assigned to the pathogenic agent, which was construed as organically conditioned and likened to a symptom of poisoning (e.g., paranoid states in chronic poisoning).

REVIEW OF SADGER: "KONRAD FERDINAND MEYER. EINE PATHOGRAPHISCH-PSYCHOLOGISCHE STUDIE"¹

[795] The new art of writing biographies from the psychological point of view has already produced a number of moderately successful studies. One has only to think of Möbius² on Goethe, Schopenhauer, Schumann, and Nietzsche, and Lange on Hölderlin.³ Among these "pathographies," Sadger's book occupies an exceptional position. It does not stand out because of a meticulous unearthing of the diagnosis, nor does it try to squeeze the poet's pathology into a particular clinical frame of reference, as Möbius did in an objectionable manner in the case of Goethe. Sadger's aim is rather to understand the development of the whole personality as a psychological process, and to grasp it from within. It is no matter for regret that the psychiatric pigeon-holing of the "case" receives scant attention. Our understanding is in no way advanced when we know for certain the medical designation of the subject's state of mind. The recognition that Schumann suffered from dementia praecox and K. F. Meyer from periodic melancholia contributes nothing whatever to an understanding of their psyches. People are only too ready to stop at the diagnosis, thinking that any further understanding can be dispensed with. But this is just where the real task of the pathographer begins, if he wants, as he should, to understand more than the ordinary biographer. The biographer would rather not penetrate too deeply into certain areas, and because he does not understand what is going on there and can discover nothing understandable, he calls those areas mad or "pathological." Möbius sticks psychiatric labels on them and reports something of their geography. The proper task of the pathographer, however, is to describe in intelligible language what is actually happening in these locked regions of the psyche, and what powerful influences pass to and fro between the world of the understandable and the world of the not-understood. Up to now psychography has failed miserably, believing that its task is complete once insanity has been established; and there is some justification for this since not a few of the most prominent modern psychiatrists are firmly convinced that insanity is beyond further understanding. The validity of this statement is purely subjective, however: anything we do not understand we are likely to call insane. In view of this limitation, we should not venture so far, let alone assert that what we do not understand is not understandable at all. It is understandable, only we are intellectually still so dense and lethargic that our ears cannot hear and our minds cannot grasp the mysteries of which the insane speak. Here and there we do understand something, and occasionally we glimpse inner connections which link up

what appears to be wildly fortuitous and utterly incoherent into regular causal chains. We owe this insight to the genius of Sigmund Freud and his psychology, which is now undergoing all the punishments of hell that the scientific Philistines hold in reserve for every new discovery.⁴

[796] Anyone who wishes to read Sadger's book with real understanding should first familiarize himself with Freud's psychology, otherwise he will get a curious impression of the special prominence the author gives to the significance of the mother in the life of the poet. Lacking the requisite knowledge the reader will also find it difficult to understand many of the parenthetical remarks concerning the father-son and mother-son relationship and to appreciate their general validity. It will be evident from these hints that Sadger's book can claim a special place among the pathographies because, unlike the others, it digs down far deeper to the very roots of the pathological and annexes wide areas of that dark world of the non-understood to the world of intelligible things. Anyone who has been able to profit by Freud's writings will read with great interest how the sensitive soul of the poet gradually freed itself from the crushing weight of mother-love and its attendant emotional conflicts, and how as a result the hidden source of poetic creativity began to flow. We owe the author a debt of gratitude for this glimpse into the life of an artist whose development presents so many baffling problems. Readers who bring no preliminary knowledge with them may be prompted by this book to acquire some.

REVIEW OF WALDSTEIN: "DAS UNBEWUSSTE ICH"¹

[797] For a variety of reasons it is welcome news that Waldstein's book *The Subconscious Self* has been rescued from oblivion and made accessible to a wider public in an excellent translation. The content of the book is equally good and, in places, very important. In his preface to the German edition, Dr. Veraguth² (Zurich) remarks that the book, first published more than a decade ago, is to be valued primarily as an historical document. This, unfortunately, is only too true, for nowhere does the present end sooner and the past begin earlier than in medical literature. The English edition was published at a time when another turn of the ascending spiral of scientific knowledge had just been completed in Germany. The scientists had once again reached the point that had been reached eighty years earlier. Those were the days of that remarkable man Franz Anton Mesmer,³ perhaps the first in the German-speaking world to observe that, armed with the necessary self-assurance, practically anyone could imitate the miraculous cures wrought at places of pilgrimage, by priests, French kings, and thaumaturges in sheep's clothing (witness Ast the Shepherd, who relieved his milieu of several million marks). This art was named "Mesmerism." It was not a swindle, and much good was accomplished by it. Mesmer offered his art to science, and even founded a school, but he took too little account of the fact that ever since science has existed there has also existed an undying élite enthroned at the top, that knows everything far better than anybody else, and from time to time guards mankind against various pernicious aberrations. It protected us from the erroneous belief that Jupiter had moons, that such things as meteors could fall from the air, that puerperal fever was caused by dirty hands, and that the brain possessed a fibrous structure. For eighty years the élite protected psychology from the discovery of hypnotism by pooh-poohing Mesmer's "animal magnetism." Nevertheless a few German crackpots and obscurantists of the Romantic Age kept Mesmer's teachings alive, quietly collecting observations and experiences that were ridiculed by their contemporaries and successors because they smacked of superstition. Notwithstanding the persistent mocking laughter, the numerous books from the pen of Justinus Kerner, Eschenmayer, Ennemoser, Horst, etc.,⁴ to name but a few who reported "curious tales of somnambulists," contain, along with obvious nonsense, glaring truths which were put to sleep for the next sixty years. The French country doctor Liébeault,⁵ who made a timid attempt in the sixties to publish a little book on this subject, was stuck with his whole edition unsold at the publisher's for twenty years. Thirty years later there existed a literature of hundreds of books and a

number of technical periodicals. The spiral had once again entered this domain. All of a sudden it was discovered that an enormous amount could be done, both in theory and practice, with the earlier “Mesmerism”; that apparently dangerous symptoms of nervous ailments, such as paresis, contractures, paraesthesias, etc., could be produced at will by suggestion and then blown away again—in short, that the whole army of the neuroses, accounting for at least eighty per cent of the neurologist’s clientele, were disturbances of a psychic nature. (A realization that is so modern today that its rediscoverers are hailed as incalculably great benefactors of mankind.)

[798] In its unfathomable wisdom the élite instantly recognized that mankind was in dire peril, and declared (1) that suggestion therapy was fraudulent and ineffective; (2) that it was exceedingly dangerous; (3) that the insights gained by hypnotic methods were sheer fabrication, imagination, and suggestion; and (4) that the neuroses were organic diseases of the brain. It had, however, also been rediscovered that our consciousness obviously does not cover the full range of the psyche, that the psychic factor exists and is effective in regions beyond the reach of consciousness. This psychic factor beyond consciousness was named the subconscious or the second ego or the unconscious personality, etc. In Germany the heretics were Dessoir, Forel, Moll, Vogt, and Schrenck-Notzing,⁶ among others, and in France, Binet, Janet, and their schools. Waldstein’s book on the “subconscious” ego came out just when the movement in Germany had reached its climax. All honest researchers greeted this resurgence with enthusiasm, but the élite rightly regarded it as deleterious to the development of logical thought. The leading authorities therefore asserted that the subconscious was (1) nonexistent; (2) not psychic but physiological, and hence impenetrable; (3) only feebly conscious, so feeble, in fact, that one is no longer conscious of being conscious of it. Since then the investigators of the “unconscious” have been branded as unscientific; the “unconscious” has no existence at all and is merely a feeble flicker of consciousness. Or else it is physiological, which is the opposite of psychological, and therefore not the concern of the psychologist or of anybody else. In this way it is barricaded against investigation.

[799] But this time, in spite of everything, the seed did not die. Work went ahead steadily, and today we are much further advanced than we were a decade ago. Even so, this advance holds only for the few who have not allowed themselves to become embittered, and who are working indefatigably to open up the abysses of the human psyche to consciousness. For these few, Waldstein’s book is, to be sure, no novelty and will add little to their knowledge, but for all others it contains much that is new and much that is good. It has shrewd things to say about aesthetics and the origin of works of art. Still better is its psychological conception of the neuroses, a conception which one hopes will be widely disseminated, seeing that the élite still clings firmly to the notion that hysteria and nervous disorders originate in alterations within the

brain. Unfortunately many run-of-the-mill doctors still swear by this gospel to the detriment of their neurotic patients, whom our age produces in swarms. Nearly all these patients have been convinced by the medical dogma that their sickness is of a physical nature. Again and again the doctors back up this nonsense, and the treatment goes muddling on with its medicaments and magic nostrums. It is hardly surprising that nowadays Christian Science has better results to show than many neurologists. This little book performs a valuable service by at least throwing a ray of light on those dark regions of the psyche from which all human achievements ultimately spring, whether they be artistic creations or nervous disorders. It is to be hoped that books of this kind will find favour with the educated public, so as gradually to prepare the ground for a deeper understanding of the human psyche, and to free the minds of the sound and sick alike from the crass materialism of the cerebro-organic dogma. The sensitive psychological note which Waldstein strikes gives his book a particularly attractive character, even though his analysis does not probe nearly as deeply as Freud's researches.

CRIME AND THE SOUL¹

[800] The dual personality of the criminal is frequently apparent at first glance. One need not follow the tortuous path of his psychological experiences, disguises, and eventual unmasking as the story of his dual existence is dramatically told in the film. Generally speaking, every criminal, in his outward show of acting honourably, wears a quite simple disguise which is easily recognizable. Of course, this does not apply to the lowest dregs of the criminal fraternity—to the men and women who have become outcasts from all ordinary human society. Generally, however, criminals, men and women alike, betray a certain ambition to be respectable, and repeatedly emphasize their respectability. The “romance” of a criminal existence is only rarely romantic. A very large number of criminals lead a thoroughly middle-class existence and commit their crimes, as it were, through their second selves. Few criminals succeed in attaining a complete severance between their liking for middle-class respectability, on the one hand, and their instinct for crime on the other.

[801] It is a terrible fact that crime seems to creep up on the criminal as something foreign that gradually gains a hold on him so that eventually he has no knowledge from one moment to another of what he is about to do. Let me illustrate this with a striking example from my own experience.

[802] A nine-year-old boy stabbed his little sister above the eye with a pair of scissors, which penetrated as far as the cerebral membrane. Had it gone half a millimetre deeper the child would have died instantly. Two years earlier, when the boy was seven, his mother told me that there was something wrong with him. The boy was doing some peculiar things. At school, during lessons, he would suddenly rise from his seat and cling to his teacher with every sign of extreme terror. At home he would often run away from play and hide in the loft. When asked to explain the reason he made no reply. When I spoke to the boy he told me that he had frequent attacks of cramp. Then the following conversation took place:

[803] “Why are you always afraid?”

[804] The child did not reply. I realized that he was reluctant to speak, so I tried persuasion. Finally he said:

[805] “I must not tell you.”

[806] “Why not?”

[807] “I pressed him further, but all I was able to get out of him was that he must not say why he was afraid. At last he blurted it out.

[808] “I am afraid of the man,” he said.

[809] “What man?”

[810] No reply. Then, after much wheedling, I succeeded in winning his confidence. He told me that at the age of seven a little man appeared to him. The little man had a beard. The boy also gave other details of the little man’s appearance. This little man had winked at him, and that had frightened him. That was why he clung to his teacher at school and ran away from play at home to hide in the loft.

[811] “What did this little man want of you?” I asked.

[812] “He wanted to put the blame on me.”

[813] “What do you mean by ‘blame’?”

[814] The boy could not answer. He merely repeated the word “blame.” He said that each time the little man came nearer and nearer to him, and last time he had come quite close, and that was why he, the boy, stabbed his sister. The appearance of the little man was none other than the personification of the criminal instinct, and what the boy described as “blame” was a symbol of the second self that was driving him to destruction.

[815] After the crime the boy had epileptic fits. Since then he has committed no further crimes. In this case as in many others, epilepsy represented an evasion of the crime, a repression of the criminal instinct. Unconsciously people try to escape the inner urge to crime by taking refuge in illness.

[816] In other cases it happens that people who are apparently normal transmit the evil instincts concealed under this appearance of normality to other people, and frequently lead them, quite unconsciously, to carry out the deeds which they themselves would never commit although they would like to.

[817] Here is an example: Some time ago there was a murder in the Rhineland which created a great sensation. A man of up-to-then blameless character killed his entire family, and even his dog. No one knew the reason; no one had ever noticed anything abnormal about the man. This man told me that he had bought a knife without having any particular object in mind. One night he fell asleep in the living-room, where there was a clock with a pendulum. He heard the ticking of the clock, and this tick-tock was like the sound of a battalion of marching soldiers. The sound of marching gradually died away, as though the battalion had passed. When it ceased completely he suddenly felt, “Now I must do it.” Then he committed the murders. He stabbed his wife eleven times.

[818] According to my subsequent investigations it was the woman who was chiefly to blame for what happened. She belonged to a religious sect, whose members regarded all who do not pray with them as outsiders, children of the devil, and themselves as saints. This woman transmitted the evil that was in her, unconsciously perhaps, but

quite certainly, to her husband. She persuaded him that he was evil, whereas she herself was good, and instilled the criminal instinct into his subconscious mind. It was characteristic that the husband recited a saying from the Bible at each stab, which best indicates the origin of his hostility.

[819] Far more crime, cruelty, and horror occur in the human soul than in the external world. The soul of the criminal, as manifested in his deeds, often affords an insight into the deepest psychological processes of humanity in general. Sometimes it is quite remarkable what a background such murders have, and how people are driven to perpetrate acts which at any other time and of their own accord they would never commit.

[820] Once a baker went for his Sunday walk. The next thing he knew was that on waking up he found himself in a police cell, with his hands and feet manacled. He was amazed. He thought he was dreaming. He had no idea why he was locked up. But in the meantime the man had murdered three people and seriously injured two. Undoubtedly he committed these crimes in a cataleptic state. The baker's Sunday walk turned out quite differently from what he had intended on leaving home. The wife of this baker was a member of the same sect as the other woman, and therefore a "saint," so that the motive of this crime is analogous to that described above.

[821] The more evil a person is, the more he tries to force upon others the wickedness he does not want to show to the outside world. The baker and the Rhinelanders were respectable men. Before they committed their crimes they would have been amazed had anyone thought them capable of such things. They certainly never intended to commit murder. This idea was unconsciously instilled into them as a means of abreacting the evil instincts of their wives. Man is a very complicated being, and though he knows a great deal about all sorts of things, he knows very little about himself.

THE QUESTION OF MEDICAL INTERVENTION¹

The medical journal *Psyche* published answers² to a questionnaire sent to twenty-eight doctors concerning a report by Dr. Medard Boss, delivered at the 66th Congress of South-west German Psychiatrists and Neurologists in Badenweiler, in which he presented the case of a transvestite “under its existential-analytical aspect.” The treatment ended with the total castration of the patient by Dr. Boss, including amputation of the penis with implantation of artificial labiae. The report provoked critical comments from some of his colleagues³ followed by a rejoinder from Dr. Boss.⁴ In view of the significance of the case for the doctor-patient relationship, the editors of *Psyche* circulated the following questionnaire to the colleagues whom Dr. Boss had named:

1. Do you consider an intervention like that performed by Dr. Boss permissible from the general medical standpoint or not?

2. Do you consider such an intervention permissible from the standpoint of the psychotherapist?

[822] I had first of all to plough my way through the report of this case. The totally superfluous existentialist jargon complicates the situation unnecessarily and does not make for enjoyable reading. The patient was obviously bent upon getting himself transformed into a woman as far as possible and equally set against any other kind of influence. It is quite clear that nothing could be done about it psychotherapeutically. That settles Question 2. An operation like this has nothing to do with psychotherapy, because anyone, the patient included, could have advised himself to ask a surgeon to castrate him. If Dr. Boss gave him this advice, that is his own private affair, and something that one does not make a song and dance about in public.

[823] Question 1 is not so easy to answer. On the principle *nulla poena sine lege* an intervention of this kind is “justified” if the law either permits it or does not forbid it. There is no law against cosmetic operations, and if I succeed in persuading a surgeon to amputate a finger for me that is his and my private affair, a problem of individual ethics. If anyone who is *compos mentis* wishes to be castrated and feels happier for it afterwards than he did before, there is not much in his action that one can fairly object to. If the doctor is convinced that such an operation really does help his patient, and nobody is injured by it, his ethical disposition to help and ameliorate might very well prompt him to perform the operation without anyone being in a position to object to it on principle. Only, he should realize that he is offending the collective professional ethics of doctors in a hazardous way by his somewhat unusual

and unconventional procedure. Moreover, the operation affects an organ that is the object of a collective taboo; that is to say, castration is a *numinous mutilation* which makes a powerful impression on everyone and is consequently hedged about with all sorts of emotional considerations. A doctor who risks this intervention should not be surprised if there is a collective reaction against it. He may be justified before his own conscience, but he risks his reputation by violating collective feeling. (The hangman is in much the same situation.) Insults of this nature are not in the interests of the medical profession and are therefore, quite rightly, abhorred.

[824] Dr. Boss would have done better to preserve a decent silence about this painful affair instead of proclaiming it *urbi et orbi* with “existential-analytical” *éclat*, however concerned he was to justify himself in the eyes of his profession. Evidently he has only the dimmest notion of how much his action offends professional medical feeling.

[825] So I can answer Question I by saying that, for the above reasons, I consider the intervention, from the medical standpoint, hazardous if not impermissible. From the individual standpoint I would prefer to give Dr. Boss the benefit of the doubt.

FOREWORD TO CUSTANCE: "WISDOM, MADNESS AND FOLLY"¹

[826] When I was working in 1906 on my book *The Psychology of Dementia Praecox*² (as schizophrenia was then called), I never dreamt that in the succeeding half-century psychological investigation of the psychoses and their contents would make virtually no progress whatever. The dogma, or intellectual superstition, that only physical causes are valid still bars the psychiatrist's way to the psyche of his patient and impels him to take the most reckless and incalculable liberties with this most delicate of all organs rather than allow himself even to think about the possibility of genuinely psychic causes and effects, although these are perfectly obvious to an unprejudiced mind. All that is necessary is to pay attention to them, but this is just what the materialistic prejudice prevents people from doing, even when they have seen through the futility of metaphysical assumptions. The organic, despite the fact that its nature is largely unknown and purely hypothetical, seems much more convincing than psychic reality, since this still does not exist in its own right and is regarded as a miserable vapour exhaled, as it were, from the albuminous scheme of things. How in the world do people know that the only reality is the physical atom, when this cannot even be proved to exist at all except by means of the psyche? If there is anything that can be described as primary, it must surely be the psyche and not the atom, which, like everything else in our experience, is presented to us directly only as a psychic model or image.

[827] I still remember vividly the great impression it made upon me when I succeeded for the first time in deciphering the apparently complete nonsense of schizophrenic neologisms, which must have been infinitely easier than deciphering hieroglyphs or cuneiform inscriptions. While these give us authentic insight into the intellectual culture of ancient man—an achievement certainly not to be underestimated—deciphering of the products of insanity and of other manifestations of the unconscious unlocks the meaning of far older and more fundamental psychic processes, and opens the way to a psychic underworld or hinterland which is the matrix not only of the mental products of the past but of consciousness itself. This, however, seems quite uninteresting to the psychiatrist and to concern him least of all—just as if it were tremendously important to know exactly where the stones were quarried to build our medieval cathedrals, but of no importance whatever to know what the meaning and purpose of these edifices might be.

[828] Half a century has not sufficed to give the psychiatrist, the "doctor of the soul," the smallest acquaintance with the structure and contents of the psyche. Nobody need

write an apology for the meaning of the brain since it can actually be put under the microscope. The psyche, however, is nothing, because it is not sufficiently physical to be stained and mounted on a slide. People still go on despising what they don't know, and what they know least of all they claim to know best. The very attempt to bring some kind of order into the chaos of psychological experience is considered "unscientific," because the criteria of physical reality cannot be applied directly to psychic reality. Documentary evidence, though fully recognized in the study of history and in jurisprudence, still seems to be unknown in the realm of psychiatry.

[829] For this reason a book like the present one should be particularly welcome to psychologists. It is a *document humain*, unfortunately one of few. I know no more than half a dozen such autochthonous descriptions of psychosis, and of these this is the only one derived from the domain of manic-depressive insanity, all the others being derived from that of schizophrenia. In my experience at any rate it is quite unique. Certainly there are, in numerous clinical histories, comparable descriptions given by the patients themselves, but they never reach the light of day in the form of a printed publication; and besides, few of them could equal the autobiography of our author in point of articulateness, general education, wide reading, deep thought, and self-criticism. The value of this book is all the greater because, uninfluenced by any outside literature, it describes the discovery, or rather the rediscovery, of certain fundamental and typical psychic structures. Although I myself have been studying the very same phenomena for years, and have repeatedly described them, it still came to me as a surprise and a novelty to see how the delirious flight of ideas and uninhibitedness of the manic state lower the threshold of consciousness to such an extent that, as with the *abaissement du niveau mental* in schizophrenia, the unconscious is laid bare and rendered intelligible. What the author has discovered in the manic state is in exact agreement with my own discoveries. By this I mean more particularly the structure of opposites and their symbolism, the anima archetype, and lastly the unavoidable encounter with the reality of the psyche. As is generally known, these three main points play an essential role in my psychology, with which, however, the author did not become acquainted until afterwards.

[830] It is of particular interest, more especially for the expert in this field, to see what kind of total picture emerges when the inhibitions exerted by the conscious mind on the unconscious are removed in mania. The result is a crude and unmitigated system of opposites, of every conceivable colour and form, extending from the heights to the depths. The symbolism is predominantly collective and archetypal in character, and thus decidedly mythological or religious. Clear indications of an individuation process are absent, since the dialectical drama unfolds in the spontaneous, inner confrontation of opposites before the eyes of a perceiving and reflecting subject. He does not stand in any dialectical relationship to a human partner; in other words,

there is no dialogue. The values delineate themselves in an undifferentiated system of black and white, and the problem of the differentiated functions is not posed. Hence the absence of any clear signs of individuation; as is well known, the prerequisite for this is an intense relationship with another individual and a coming to terms with him. The question of relationship, or Eros, nowhere appears as a problem in this book. Instead, psychic reality, which the author very rightly calls “actuality,” receives all the more attention, and the value of this cannot be denied.

[831] As might be expected from the impressive contents of his psychosis, the author was profoundly affected by them. This runs like a leit-motiv through his book from the beginning to the end, making it a confessional monologue addressed to an anonymous circle of listeners, as well as an encounter with the equally anonymous spirit of the age. Its intellectual horizon is wide and does honour to the “logos” of its author. I do not know what sort of impression it will make on the “normal” layman, who has never had anything thrust upon him from the other side of the barrier. I can only say that psychiatrists and practising psychologists owe the author the greatest possible thanks for the illumination his unaided efforts have given them. As a contribution to our knowledge of those highly significant psychic contents that manifest themselves in pathological conditions or underlie them, his book is as valuable as it is unique.

FOREWORD TO PERRY: "THE SELF IN PSYCHOTIC PROCESS"¹

[832] As I studied Dr. Perry's manuscript, I could not help recalling the time when I was a young alienist searching vainly for a point of view which would enable me to understand the workings of the diseased mind. Merely clinical observations—and the subsequent post mortem when one used to stare at a brain which ought to have been out of order yet showed no sign of abnormality—were not particularly enlightening. "Mental diseases are diseases of the brain" was the *axiom*, and told one just nothing at all. Within my first months at the Clinic,² I realized that the thing I lacked was a *real psychopathology*, a science which showed what was happening in the mind during a psychosis. I could never be satisfied with the idea that all that the patients produced, especially the schizophrenics, was nonsense and chaotic gibberish. On the contrary, I soon convinced myself that their productions meant something which could be understood, if only one were able to find out what it was. In 1901, I started my association experiments with normal test persons in order to create a normal basis for comparison. I found then that the experiments were almost regularly disturbed by psychic factors beyond the control of consciousness. I called them *complexes*. No sooner had I established this fact than I applied my discovery to cases of hysteria and schizophrenia. In both I found an inordinate amount of disturbance, which meant that the unconscious in these conditions is not only opposed to consciousness but also has an extraordinary energetic charge. While with neurotics the complexes consist of split-off contents, which are systematically arranged, and for this reason are easily understandable, with schizophrenics the unconscious proves to be not only unmanageable and autonomous, but highly unsystematic, disordered, and even chaotic. Moreover, it has a peculiar dreamlike quality, with associations and bizarre ideas such as are found in dreams. In my attempts to understand the contents of schizophrenic psychoses, I was considerably helped by Freud's book on dream interpretation, which had just appeared (1900). By 1905, I had acquired so much reliable knowledge about the psychology of schizophrenia (then called "dementia praecox") that I was able to write two papers³ about it. *The Psychology of Dementia Praecox* (1906) had practically no influence at all, since nobody was interested in pathological psychology except Freud, with whom I had the honour of collaborating for the next seven years.

[833] Dr. Perry, in this book, gives an excellent picture of the psychic contents with which I found myself confronted. At the beginning, I felt completely at a loss in understanding the association of ideas which I could observe daily with my patients. I

did not know then that all the time I had the key to the mystery in my pocket, inasmuch as I could not help seeing the often striking parallelism between the patients' delusions and mythological motifs. But for a long time I did not dare to assume any relationship between mythological formations and individual morbid delusions. Moreover, my knowledge of folklore, mythology, and primitive psychology was regrettably deficient, so that I was slow in discovering how common these parallels were. Our clinical approach to the human mind was only medical, which was about as helpful as the approach of the mineralogist to Chartres Cathedral. Our training as alienists was much concerned with the anatomy of the brain but not at all with the human psyche. One could not expect very much more in those days, when even neuroses, with their overflow of psychological material, were a psychological *terra incognita*. The main art the students of psychiatry had to learn in those days was how not to listen to their patients.

[834] Well, I had begun to listen, and so had Freud. He was impressed with certain facts of neurotic psychology, which he even named after a famous mythological model, but I was overwhelmed with "historical" material while studying the psychotic mind. From 1906 until 1912 I acquired as much knowledge of mythology, primitive psychology, and comparative religion as possible. This study gave me the key to an understanding of the deeper layers of the psyche and I was thus enabled to write my book⁴ with the English title *Psychology of the Unconscious*. This title is slightly misleading, for the book represents the analysis of a prodromal schizophrenic condition. It appeared forty years ago, and last year I published a fourth, revised edition under the title *Symbols of Transformation*. One could not say that it had any noticeable influence on psychiatry. The alienist's lack of psychological interest is by no means peculiar to him. He shares it with a number of other schools of thought, such as theology, philosophy, political economy, history, and medicine, which all stand in need of psychological understanding and yet allow themselves to be prejudiced against it and remain ignorant of it. It is only within the last years, for instance, that medicine has recognized "psychosomatics."

[835] Psychiatry has entirely neglected the study of the psychotic mind, in spite of the fact that an investigation of this kind is important not only from a scientific and theoretical standpoint but also from that of practical therapy.

[836] Therefore I welcome Dr. Perry's book as a messenger of a time when the psyche of the mental patient will receive the interest it deserves. The author gives a fair representation of an average case of schizophrenia, with its peculiar mental structure, and, at the same time, he shows the reader what he should know about general human psychology if he wishes to understand the apparently chaotic distortions and the grotesque "bizarrerie" of the diseased mind. An adequate understanding often has a remarkable therapeutic effect in milder cases which, of course, do not appear in

mental hospitals, but all the more in the consultation hours of the private specialist. One should not underrate the disastrous shock which patients undergo when they find themselves assailed by the intrusion of strange contents which they are unable to integrate. The mere fact that they have such ideas isolates them from their fellow men and exposes them to an irresistible panic, which often marks the outbreak of the manifest psychosis. If, on the other hand, they meet with adequate understanding from their physician, they do not fall into a panic, because they are still understood by a human being and thus preserved from the disastrous shock of complete isolation.

[837] The strange contents which invade consciousness are rarely met with in neurotic cases, least not directly, which is the reason why so many psychotherapists are unfamiliar with the deeper strata of the human psyche. The alienist, on the other hand, rarely has the time or the necessary scientific equipment to deal with, or even to bother with, his patients' psychology. In this respect, the author's book fills a yawning gap. The reader should not be misled by the current prejudice that I produce nothing but theories. My so-called theories are not figments but facts that can be verified, if one only takes the trouble, as the author has done with so much success, to listen to the patient, to give him the credit—that is humanly so important—of meaning something by what he says, and to encourage him to express himself as much as he possibly can. As the author has shown, drawing, painting and other methods are sometimes of inestimable value, inasmuch as they complement and amplify verbal expression. It is of paramount importance that the investigator should be sufficiently acquainted with the history and phenomenology of the mind. Without such knowledge, he could not understand the symbolic language of the unconscious and so would be unable to help his patient assimilate the irrational ideas that bewilder and confuse his consciousness. It is not a "peculiar historical interest," a sort of hobby of mine to collect historical curiosities, as has been suggested, but an earnest endeavour to help the understanding of the diseased mind. *The psyche, like the body, is an extremely historical structure.*

[838] I hope that Dr. Perry's book will arouse the psychiatrist's interest in the psychological aspect of his cases. Psychology belongs as much to his training as anatomy and physiology to that of the surgeon.

FOREWORD TO SCHMALTZ: "KOMPLEXE PSYCHOLOGIE UND KÖRPERLICHES SYMPTOM"¹

[839] Having read his book with lively interest and undivided agreement, I am all the more ready to comply with the author's request that I say a few words by way of introduction. He has successfully undertaken to treat a case from the field of psychosomatic medicine psychologically, in collaboration with an internal specialist, and to describe the whole course of the treatment up to the cure in all its details. The clinical description of the case is impeccable and thorough, and it seems to me that its psychological elucidation and interpretation is equally satisfactory. Nowhere does the author betray any theoretical bias; all his conclusions are amply documented with noteworthy care and circumspection. The clinical history concerns one of those frequent cases of cardiac disorder, a disease that is associated with the lesion of feeling so characteristic of our time. The author deserves particular credit for fearlessly pointing out the deeper reasons for a neurosis and for setting it in a broader context. A neurosis is an expression of the "affections" of the whole man, and it is impossible to treat the whole man solely within the framework of a medical specialism. Psychogenic causes have to do with the psyche, and this, by its very nature, not only extends beyond the medical horizon but also, as the matrix of all psychic events, transcends the bounds of scientific understanding. Certainly the aetiological details have to be worked out within the limits of a specialist method, but the psychology and therapy of the neurosis demand an Archimedean point outside, without which they merely turn in a circle. Indeed, medicine itself is a science that has been able to make such great progress only because it borrowed lavishly from the other sciences. It necessarily had to draw physics, chemistry, and biology into its orbit, and if this was true of somatic medicine, then the psychology of the neuroses will not be able to get along without borrowing from the humanities.

[840] Of decisive importance for the aetiology and therapy of the neuroses is the individual's own attitude. If this is subjected to careful analysis, one finds that it rests on personal and collective premises which can be pathogenic as well as curative in their effects. Just as modern medicine is no longer content to establish that a patient has infected himself with typhoid fever, but must also worry about the water supply responsible for the infection, so the psychology of the neuroses cannot possibly be content with an aetiology that makes do with traumata and infantile fantasies. We have known for a long time that children's neuroses depend on the psychic situation of the parents. We also know to our cost how much these "psychic situations" are due

not merely to personal defects but to collective psychic conditions. That would be reason enough for the specialist to take heed of these general conditions—one cannot combat an epidemic of typhoid even with the most careful diagnosis and treatment of individual cases. The older medicine had to be satisfied with handing out any philtre provided only that it helped. Thanks to the auxiliary sciences, modern medicine is in a position to find out the true nature of its nostrums. But what cures a neurosis? In order to find the real answer to this question, the psychology of the neuroses must go far beyond its purely medical confines. There are a few doctors who already have inklings of this. In this respect, too, the author has dared to fling open one or two windows.

VI

FREUD AND PSYCHOANALYSIS

(related to Volume 4 of the Collected Works)

SIGMUND FREUD: "ON DREAMS"¹

25 January 1901

[841] Freud begins by giving a short exposition of his work. He first distinguishes the various interpretations which the problem of dreams has undergone in the course of history:

1. The old "mythological" or, rather, mystical hypothesis that dreams are meaningful utterances of a soul freed from the fetters of sense. The soul is conceived as a transcendent entity which either produces dreams independently, as [Gotthilf Heinrich von] Schubert still supposed, or else represents the medium of communication between the conscious mind and divine revelation.

2. The more recent hypothesis of [K. A.] Schemer and [J.] Volkelt, according to which dreams owe their existence to the operation of psychic forces that are held in check during the day.

3. The critical modern view that dreams can be traced back to peripheral stimuli which partially affect the cerebral cortex and thereby induce dream-activity.

4. The common opinion that dreams have a deeper meaning, and may even foretell the future. Freud, with reservations, inclines to this view. He does not deny the dream a deeper meaning and admits the rightness of the common method of dream interpretation, in so far as it takes the dream-image as a symbol for a hidden content that has a meaning.

[842] In his opening observations Freud compares dreams with obsessional ideas, which, like them, are strange and inexplicable to the conscious mind.

[843] The psychotherapy of obsessional ideas offers the key to unravelling the ideas in dreams. Just as we get a patient who suffers from an obsession to take note of all the ideas that associate themselves with the dominating idea, we can make upon ourselves the experiment of observing everything that becomes associated with the ideas in the dream if, without criticism, we allow all those things to appear which we are in the habit of suppressing as worthless and disturbing. We take note, therefore, of all psychically valueless ideas, the momentary perceptions and thoughts which are not accompanied by any deeper feeling of value, and which are produced every day in unending quantities.

[844] Example, p. 310:² On the basis of the results of this method, Freud conjectures that the dream is a kind of substitute, that is, a symbolic representation of trains of thought that have a meaning, and are often bound up with lively affects. The

mechanism of this substitution is still not very clear at present, but at any rate we may accord it the status of an extremely important psychological process once we have established its beginning and end by the method just described. Freud calls the content of the dream as it appears in consciousness the *manifest content of the dream*. The material of the dream, the psychological premises, that is to say all the trains of thought that are hidden from the dreaming consciousness and can be discovered only by analysis, he calls the *latent content of the dream*. The synthetic process, which elaborates the disconnected or only superficially connected ideas into a relatively unified dream-image, is called the *dream-work*.

[845] We are now faced with two cardinal questions:

1. What is the psychic process that changes the latent dream-content into the manifest dream-content?
2. What is the motive for this change?

[846] There are dreams whose latent content is not hidden at all, or barely so, and which in themselves are logical and understandable because the latent content is practically identical with the manifest content. Children's dreams are frequently of this kind, because the thought-world of children is chiefly filled with sensuous, concrete imagery. The more complicated and abstract the thoughts of an adult become, the more confused are most of his dreams. We seldom meet with a completely transparent and coherent dream in an adult. Frequently the dreams of adults belong to the class of dreams which, though meaningful and logical in themselves, are unintelligible because their meaning does not in any way fit the thought-processes of the waking consciousness. The great majority of dreams, however, are confused, incoherent dreams that surprise us by their absurd or impossible features. These are the dreams, also, that are furthest removed from their premise, the latent dream-material, that bear the least resemblance to it and are therefore difficult to analyse, and have required for their synthesis the greatest expenditure of transformative psychic energy.

[847] Children's dreams, with their clarity and transparent meaning, are the least subject to the transformative activity of the dream-work. Their nature is therefore fairly clear; most of them are wish-dreams.

[848] A child that is hungry dreams of food, a pleasure forbidden the day before is enacted in the dream, etc. Children are concerned with simple sensuous objects and simple wishes, and for this reason their dreams are very simple too. When adults are concerned with similar objects, their dreams as well are very simple. To this class belong the so-called dreams of convenience, most of which take place shortly before waking. For example, it is time to get up, and one dreams that one is up already, washing, dressing, and already at work. Or if any kind of examination is impending, one finds oneself in the middle of it, etc. With adults, however, very simple-looking

dreams are often fairly complicated because several wishes come into conflict and influence the formation of the dream-image.

[849] For children's dreams and dreams of convenience in adults the author lays down the following formula: A thought expressed in the optative has been replaced by a representation in the present tense.³

[850] The second of the questions we asked, concerning the motive for the conversion of the latent content into the concrete dream-image, can be answered most easily in these simple cases. Evidently the enacted fulfilment of the wish mitigates its affectivity; in consequence, the wish does not succeed in breaking through the inhibition and waking the sleeping organism. In this case, therefore, the dream performs the function of a guardian of sleep.

[851] Our first question, concerning the process of the dream-work, can best be answered by examining the confused dreams.

[852] In examining a confused dream, the first thing that strikes us is how very much richer the latent dream-material is than the dream-image constructed from it. Every idea in the manifest dream proves, on analysis, to be associated with at least three or four other ideas which all have something in common. The corresponding dream-image frequently combines all the different characteristics of the individual underlying ideas. Freud compares such an image with Galton's family photographs, in which several exposures are superimposed. This combination of different ideas Freud calls *condensation*. To this process is due the indefinite, blurred quality of many dream-images. The dream knows no "either-or" but only the copulative "and."

[853] Often, on a superficial examination of two ideas united in a single image, no common factor can be found. But, on penetrating more deeply, we discover that whenever no *tertium comparationis* is present, the dream creates one, and generally does so by manipulating the linguistic expression of the ideas in question. Sometimes dissimilar ideas are homophonous; sometimes they rhyme, or could be confused with one another if attention is poor. The dream uses these possibilities as a *quid pro quo* and thus combines the dissimilar elements. In other cases it works not only wittily but positively poetically, speaking in tropes and metaphors, creating symbols and allegories, all for the purpose of concealment under deceptive veils. The process of condensation begets monstrous figures that far surpass the fabulous beings in Oriental fairytales. A modern philosopher holds that the reason why we are so prosaic in our daily lives is that we squander too much poetic fantasy in our dreams. The figures in a confused dream are thus, in the main, composite structures. (Example on p. 321.)⁴

[854] In the manifest dream, the latent dream-material is represented by these composite structures, which Freud calls the dream-elements. These elements are not

incoherent, but are connected together by a common dream-thought, i.e., they often represent different ways of expressing the same dominating idea.

[855] This rather complicated situation explains a good deal of the confusion and unintelligibility of the dream, but not all of it. So far we have considered only the ideational side of the dream. The feelings and affects, which play a very large part, have still to be discussed.

[856] If we analyse one of our own dreams, we finally arrive by free association at trains of thought which at one time or another were of importance to us, and which are charged with a feeling of value. During the process of condensation and reinterpretation, certain thoughts are pushed onto the stage of the dream, and their peculiar character might easily invite the dreamer to criticize and suppress them, as actually happens in the waking state. The affective side of the dream, however, prevents this, since it imbues the dream elements with feelings that act as a powerful counterweight to all criticism. Obsessional ideas function in the same way. For example, agoraphobia manifests itself with an overwhelming feeling of fear, and so maintains the position it has usurped in consciousness.

[857] Freud supposes that the affects attached to the components of the latent dream-material are transferred to the elements of the manifest dream, thus helping to complete the dissimilarity between the latent and the manifest content. He calls this process *displacement*, or, in modern terms, a transvaluation of psychic values.

[858] By means of these two principles, the author believes he can offer an adequate explanation of the obscurity and confusion of a dream constructed out of simple, concrete thought-material. These two hypotheses shed a new light on the question of the instigator of a dream, and the connection between the dream and waking life. There are dreams whose connection with waking life is quite evident, and whose instigator is a significant impression received during the day. But far more frequently the dream-instigator is an incident which, although trivial enough in itself, and often positively silly, in spite of its complete valuelessness, introduces a long and intensely affective dream. In these cases, analysis leads us back to complexes of ideas which, though unimportant in themselves, are associated with highly significant impressions of the day by incidental relationships of one kind or another. In the dream the incidental elements occupy a large and imposing place, while the significant ones are completely occluded from the dreaming consciousness. The real instigator of the dream, therefore, is not the trivial, incidental element, but the powerful affect in the background. Why, then, does the affect detach itself from the ideas that are associated with it, and in their place push the nugatory and valueless elements into consciousness? Why does the dreaming intellect trouble to rout out the forgotten, incidental, and unimportant things from every corner of our memory, and to build them up into elaborate and ingenious images?

[859] Before turning to the solution of this question, Freud tries to point out further effects of the dream-work in order to shed a clear light on the purposiveness of the dream-functions.

[860] In adults, besides visual and auditory memory-images, the material underlying the dream includes numerous abstract elements which it is not so easy to represent in concrete form. In considering the *representability of the dream-content*, a new difficulty arises which influences the dream's performance. At this point the author digresses a bit and describes how the dream represents logical relations in sensuous imagery. His observations in this respect are of no further importance for his theory; they merely serve to increase the stock of the discredited dream in the estimation of the public.

[861] One extremely remarkable effect of the dream-work is what Freud calls the *dream-composition*. This, according to his definition, is a kind of revision which the disordered mass of dream-elements undergo at the moment of their inception—a regular dramatization frequently conforming to all the rules of art exposition, development, and solution. In this way the dream acquires, as the author says, a façade, which does not of course cover it up at all points. This façade is in Freud's view the crux of the misunderstanding about dreams, since it systematizes the deceptive play of the dream-elements and brings them into a plausible relationship. Freud thinks that the reason for this final shaping of the dream-content is the regard for intelligibility. He imagines the dream producer as a kind of jocular daimon who wants to make his plans plausible to the sleeper.

[862] Apart from this last effect of the dream-work, what is created by the dream is nothing in any way new or intellectually superior. Anything of value in the dream-image can be shown by analysis to be already present in the latent material. And it may very well be doubted whether the dream-composition is anything but a direct effect of reduced consciousness, a fleeting attempt to explain the hallucinations of the dream.

[863] We now come to the final question: Why does the dream do this work? In analysing his own dreams, the author usually came upon quickly forgotten and unexpected thoughts of a distinctly unpleasant nature, which had entered his waking consciousness only to be suppressed again immediately. He designates the state of these thoughts by the name *repression*.

[864] In order to elucidate the concept of repression, the author postulates two thought-producing systems, one of which has free access to consciousness, while the other can reach consciousness only through the medium of the first. To put it more clearly, there is on the borderline between conscious and unconscious a *censorship* which is continually active throughout waking life, regulating the flow of thoughts to consciousness in such a way that it keeps back all incidental thoughts which for some

reason are prohibited, and admits to consciousness only those of which it approves. During sleep there is a momentary predominance of what was repressed by day; the censorship must relax and produces a compromise—the dream. The author does not conceal the somewhat too schematic and anthropomorphic features of this conception, but solaces himself with the hope that its objective correlate may one day be found in some organic or functional form.

[865] There are thoughts, often of a preeminently egoistic nature, which are able to slip past the censorship imposed by ethical feelings and criticism when this is relaxed in sleep. The censorship, however, is not entirely abrogated, but only reduced in effectiveness, so that it can still exert some influence on the shaping of the dream-thoughts. The dream represents the reaction of the personality to the intrusion of unruly thoughts. Its contents are repressed thoughts portrayed in distorted or disguised form.

[866] From the example of dreams that are comprehensible and have a meaning, it is evident that their content is generally a fulfilled wish. It is the same with confused dreams that are difficult to understand. They, too, contain the fulfilment of repressed wishes.

[867] Dreams, therefore, can be divided into three classes:

1. Those that represent an *unrepressed wish in undisguised form*. Such dreams are of the infantile type.

2. Those that represent the fulfilment of a *repressed wish in disguised form*. According to Freud, most dreams belong to this class.

3. Those that represent a *repressed wish in undisguised form*. Such dreams are said to be accompanied by fear, the fear taking the place of dream-distortion.

[868] Through the conception of the dream as a compromise we arrive at an explanation of dreams in general. When the waking consciousness sinks into sleep, the energy needed to maintain the inhibition against the sphere of repressed material abates. But just as the sleeper still has some attention at his disposal for sensory stimuli coming from outside, and, by means of this attention, can eliminate sleep-disturbing influences by weaving around them a disguising veil of dreams, so stimuli arising from within, from the unconscious psychic sphere, are neutralized by the periphrasis of a dream. The purpose in both cases is the same, namely, the preservation of sleep, and for this reason Freud calls the dream the “guardian of sleep.” Excellent examples of this are waking dreams, which abound in periphrastic inventions designed to make the continuation of the reverie plausible.

[869] Confused dreams are not so clear in this respect, but Freud maintains that, with application and goodwill, repressed wishes can be discovered in them too. On this point he adopts a rather one-sided attitude, since, instead of a wish, the cause of a

dream may easily prove to be just the opposite, a repressed fear, which, manifesting itself in undisguised and often exaggerated form, makes the teleological explanation of dreams appear doubtful.

Freud: Dreams

CONTENTS

[870] *Arrangement:*

Introduction.

1. Example from analysis. Uncritical tracing back of associations.

a) Manifest dream-content.

b) Latent dream-content.

2. Classification of dreams.

a) Meaningful and intelligible.

b) Meaningful and unintelligible.

c) Confused.

3. Children's dreams.

4. Adults. Dreams of convenience and wish-dreams.

5. Causes of the strangeness of dreams.

a) Condensation.

i. by means of the natural common factor.

ii. by means of a common factor created by the dream itself.

b) Displacement. Dream-distortion. Distortion of prohibited thoughts.

c) Concrete representation of inadequate ideas, hence metaphors.

Sensuous metamorphosis of logical relations.

Causal: transformation or mere juxtaposition.

Alternatives = "and."

Similarity, common factor, congruence.

Contradiction, mockery, scorn = absurdity of manifest dream.

d) Dream-composition for the purpose of intelligibility.

e) Teleological conception: dream as guardian of sleep.

REVIEW OF HELLPACH: "GRUNDLINIEN EINER PSYCHOLOGIE DER HYSTERIE"¹

[871] All those professional colleagues who are interested in the great problem of hysteria will surely welcome with joy and eager expectation a work that, judging by its bulk, promises a thorough-going treatment of the psychology of hysteria on the broadest possible basis. Anyone acquainted with the present position of the hysteria theory, and especially the psychology of hysteria, is aware that our knowledge of this obscure field is unfortunately a minimal one. Freud's researches, which have received but scant recognition though they have not yet been superseded, have prepared the ground for thinking that future research into hysteria will be psychological. Hellpach's book appears to meet this expectation. Casting the most cursory glance at the index of names appended to the end of the book, we find the following cited: Archimedes, Behring, Billroth, Büchner, Buddha, Cuvier, Darwin, Euler, Fichte, Galileo, Gall, Goethe, Herbart, Hume, Kepler, Laplace, de la Mettrie, Newton, Rousseau, Schelling, and many others, all illustrious names among which we now and then light on that of a psychiatrist or neurologist. There can be no doubt at all that a future theory of hysteria will go far beyond the narrow confines of psychiatry and neurology. The deeper we penetrate into the riddle of hysteria, the more its boundaries expand. Hellpach thus starts from a basis of great scope, assuredly not without reason. But when we recall the limitless range of knowledge indicated by the names in the index, Hellpach's basis for a psychology of hysteria would seem to have undergone a dangerous expansion.

[872] From various hints thrown out by the author we gather that he is inclined to suspect adverse critics of being ill-intentioned. I would therefore like to say at once that I have no prejudices against Hellpach. On the contrary, I have read his book *sine ira* and with attention, in the honest endeavour to understand it and be fair to it. The text up to p. 146 can be considered an introduction. There are disquisitions on the concepts, theories, and history of science, ranging over every conceivable field of knowledge, which at first blush have nothing to do with hysteria. A mere handful of aphorisms culled from the history of the hysteria theory, chiefly appreciations of the achievements of Charcot and other investigators, have a tenuous connection with the theme. I do not feel competent to criticize the highly generalized discussions on the theories of scientific research. The sidelights from the history of hysteria research are neither exhaustive as a presentation of the subject nor do they offer the researcher anything new. They make practically no contribution to psychology.

[873] The actual treatment of the theme begins on p. 147. First we have a discussion on *suggestibility*. Here Hellpach's thinking and his sure touch must be applauded: he is tackling one of the most difficult points in the hysteria theory. It is immediately obvious that the current concept of suggestibility is rather vague and hence unsatisfactory. Hellpach tries to probe the problem of volition and motivation by analysing "command" and "suggestion." The analysis leads on to a discussion of mechanization and *demotivation*: emancipation of the act of will from the motive. By various convoluted trains of thought we then get to the problem of apperception (as understood by Wundt), which is intimately connected with the problem of volition. Hellpach attaches particular importance to one quality of apperception, and that is the *extinction of sensation*. Stimuli which are only just perceptible on the periphery of the visible field may under certain circumstances be extinguished, but the source of the stimulus (small stars, etc.) disappears as the result of focussing. This observation is extended by analogy to apperception, so-called active apperception taking over the role of focussing. A sensation-extinguishing effect is thus attributed to apperception. Hellpach expatiates at length on this notion, unfortunately in a hardly intelligible manner and without adducing sufficient reasons in support. Extinction of sensation seems to him to be something common and regular. But actually it is an exception, for apperception does not extinguish sensation—on the contrary. The discussion on apperception culminates in the passage: "The control that in the more passive state of apperception extends over the whole field of consciousness disappears with the increasing tension of active apperception. This gives rise to distracted actions."

[874] A further "state of apperception" Hellpach finds in "emptiness of consciousness." Here he undertakes, among other things, a little excursion into the uncultivated deserts of dementia praecox and carries off, as a trophy, negativism as a manifestation of suggestibility in the empty consciousness of the catatonic—as though anyone had the slightest idea of what the consciousness of a catatonic looks like!

[875] The following sentence may be taken as the final result of his analysis of suggestibility: "I regard complete senselessness or complete lack of moderation as the criteria for all psychic effects that can be called suggestions." Unfortunately I can make neither head nor tail of this. In the course of a fifty-page analysis the concept of suggestibility has, to be sure, rambled off into nebulosity, one doesn't quite know how, nor does one know what has become of it. Instead we are offered two peculiar criteria for suggestion, whose beginning and end both lie in the realm of unintelligibles.

[876] There now follows a chapter on one of the thousand hysterical symptoms: ataxia-abasia. The essence of this chapter is its emphasis on the meaning of hysterical paralysis. Another chapter deals with the meaning of hysterical disturbance of

sensation. Hellpach treats hysterical pain-apraxia as an illness on its own, but offers no proof of this. Equally, he treats hysterical hyperaesthesias as a physiological and not a psychological problem. Here again conclusive reasons are lacking. Particularly in hysteria, however, “explanatory principles should not be multiplied beyond the necessary.”² To explain anaesthesia, Hellpach uses the apperceptive extinction of sensation, that aforementioned paradoxical phenomenon which is anything but a simple, certain, clear-cut fact. The proposition that hysterics cease to feel when they ought to feel must be applauded. But this singular fact should not be explained by an even more obscure and ill-founded observation.

[877] Hellpach finds the hysterical intellect characterized by *fantastic apperception* and *tractability*. Fantastic apperception is a psychological state in which “fantasy activity is linked with a tendency towards passivization of apperception.” One can dimly guess what Hellpach is getting at with this turgid pronouncement, but I must own I am incapable of forming any clear conception of it. And I do not think that Hellpach had any clear conception of it either, or he would have been able to communicate it to an attentive reader.

[878] Hellpach defines tractability as follows: “The tractable person is one who meets the demands made upon him willingly or with psychic indifference, or at least without actively fighting down inner resistances.” Suggestibility, which in an earlier chapter vanished beneath a flood of psychological and conceptual verbiage, unexpectedly surfaces here in the innocuous guise of “tractability.”

[879] In the chapter entitled “The Psychological Bar to a Psychology of Hysteria,” we get to the “root phenomenon of hysteria.” The “disproportion between the insignificance of the affective cause and the intensity of the expressive phenomenon” is supposed to be the core of hysterical mental abnormality.

[880] The last section of the book deals with the further elaboration and application of the principles previously laid down, and partly with a discussion of Freud’s teachings in regard to the genesis of hysteria. It is to Hellpach’s credit that he understands Freud and is able to keep in check and counterbalance certain biases and exaggerations of the Freudian school. But as regards the genesis of hysteria he nowhere advances beyond Freud, and in point of clarity he lags far behind.

[881] Now and then Hellpach makes sorties against the “unconscious.” He set out to explain various expressive movements in hysteria without reference to this hypothesis. This attempt deserves to be read in the original (pp. 401ff.). To me it seems neither clear nor convincing. Moreover, expressive movements are, *par excellence*, not unconscious phenomena. It is known that the hypothesis of the psychological unconscious is based on quite other facts, which Hellpach does not touch on. Even so, he makes use of the concept of the unconscious several times, probably because he knows of no better one to put in its place.

[882] His attempts in the concluding chapters to elucidate the sociological and historical aspects of the hysteria problem deserve to be greeted as a general tendency; they show that the author has an unusual, indeed splendid over-all view of his material. Unfortunately he remains stuck at all points in the most general and uncertain of concepts. The net result of all this effort is disproportionately small. The psychological gain reduces itself to the announcement of a grand design and to a few astute observations and interpretations. For this failure the blame lies not least with the extreme infelicities of Hellpach's style. If the reader has at last managed to grasp a sentence or a question, and then hopes to find its continuation or answer in the next sentence, he is again and again pulled up by explanations of how the author arrived at the first sentence and all that can or could be said about this first sentence. In this way the argument proceeds by fits and starts, and the effect of this in the long run is insufferably fatiguing. The number of wrong turns Hellpach takes is astonishing, but he enumerates still more circumstantially how many others he could have taken. The result is that he often has to explain why he is coming back to his theme again. Because of this, the book suffers from a peculiar opacity which makes orientation extraordinarily difficult.

[883] The author has, furthermore, committed a grave sin of omission in that he cites next to no examples. This omission is especially painful when pathological phenomena are being discussed. Anyone who wants to teach something new must first teach his public how to see, but without examples this is impossible. Maybe Hellpach could still come out with a few good and new things if he deigned to descend into the nether regions of case material and experimental research. If he wishes to address himself to the empiricist at all, he will find this advice assuredly justified.

REVIEWS OF PSYCHIATRIC LITERATURE¹

1906

[884] L. Bruns: *Die Hysterie im Kindesalter*. 2nd revised edn., Halle, 1906. —The author, known for his researches into the symptomatology and therapy of hysteria, has now published a second edition of his book on hysteria in childhood, a work familiar to most medical men. After a short historical introduction he gives a concise survey of the symptomatology, keeping to the empirical essentials and leaving aside all rarities and curiosities with commendable self-restraint. With the help of clear-cut cases he gives a brief description of the various forms and localizations of the paralyzes and spasms, tics and choreic affections; somnambulism, lethargies, and states of possession are treated more cursorily, being less common. The painful symptoms (neuralgias, etc.) and bladder disturbances, and particularly the *psychic* symptoms that are so extraordinarily important in hysteria, come off rather poorly. In his discussion of the aetiology, the author holds, as against Charcot, that too much significance should not be attached to heredity. More important, it seems to him, and I think rightly, are the psychic causes in the individual concerned, particularly imitation of bad examples, the influence of bad upbringing, fright, fear, etc. In many cases the influence of the parents is directly psychogenic.

[885] In view of the admitted frequency of infantile hysteria, diagnosis is of great importance, for many cases are not only retarded by a false diagnosis but are completely wrecked by it. The author takes a firm stand on psychogenesis: the unmistakable psychic element in hysterical symptoms is of the utmost significance in differential diagnosis. Often one has to rely on one's own impressions; the author quotes the classic words of Möbius:² "According to the view I have formed of the nature of hysteria, many symptoms can be hysterical, many others not." In many cases, therefore, the diagnosis of hysteria is less a science than an art. Commendably, the author urges the greatest caution against assuming *simulation*.

[886] Treatment is fundamentally *always a psychic one*; water, electricity, etc. work only by suggestion. This excellently written chapter is an invaluable guide for the practitioner, but the details of it cannot be gone into here.

[887] The book is written by a practitioner for practitioners; it is no handicap, therefore, that the theoretical side is represented somewhat aphoristically and takes no account of the latest analytical views of Freud.

[888] E. Bleuler: *Affektivität, Suggestibilität, Paranoia*.³ Halle, 1906. This work, addressed chiefly to psychologists and psychiatrists, is distinguished, like all Bleuler's publications, by its lucidity; its theme is one that is coming more and more into the forefront of psychological interest: namely, affects and their influence on the psyche. This field of research, like some other domains of psychology, suffers greatly from a confusion of concepts. Bleuler therefore proposes, first of all, a clean division between affects proper and intellectual feelings, a conceptual distinction of the greatest value in scientific discussion. *Affectivity*, comprising all affects and quasi-affective processes, is an inclusive concept which covers all nonintellectual psychic processes such as volition, feeling, suggestibility, attention, etc. It is a psychic factor that exerts as much influence on the psyche as on the body.

[889] In the first and second parts of his book Bleuler applies this conception in the realm of normal psychology. In the third part he discusses the *pathological alterations of affectivity*. Affectivity is of the greatest imaginable importance in psychopathology. Quite apart from the affective psychoses proper (manic-depressive insanity), it plays a significant role in psychoses which one was wont to regard as predominantly intellectual. Bleuler demonstrates this with the help of careful clinical histories of *paranoia originaria*.⁴ He found that the content of the paranoid picture developed from a *feeling-toned complex*, that is, from ideas accompanied by intensive affect which therefore have an abnormally strong influence on the psyche. This is the keynote of the book.

[890] It is impossible, in a short review, to do justice to the numerous perspectives which Bleuler's book opens out and to the wealth of empirical material it contains. It is urgently recommended first of all to professionals; but non-psychiatrists also, who are interested in the general problems of psychopathology, will not be able to lay it aside without reaping a rich harvest of psychological insights.

[891] Carl Wernicke.⁵ *Grundriss der Psychiatrie in klinischen Vorlesungen*. 2nd revised edn., Leipzig, 1906. — Following Wernicke's sudden death, Liepmann and Knapp have seen to the publication of the second edition of this important book, which has acted as a ferment in modern psychiatry like no other. Wernicke incarnated, so to speak, that school of psychopathology which believed it could base itself exclusively on anatomical data. His book is an impressive exponent of this thinking; besides a huge mass of empirical material we find many brilliant speculations whose starting point is always anatomical. The book is the work of an entirely original mind that tried, on the basis of clinical data combined with brain anatomy, to introduce new viewpoints into psychotherapy, hoping to effect a final synthesis of those two mutually repellent disciplines, brain anatomy and psychology. Wernicke is always the master where psychopathological events come closest to the anatomical, above all, therefore, in the treatment of problems clustering round the question of aphasia. His

“Psychophysiological Introduction,” where he tries to answer questions concerning the connection between cerebral and psychophysiological data, is, even for the non-psychiatrist, one of the most interesting in recent medical literature.

[892] The section that follows, “Paranoid States,” introduces Wernicke’s famous sejunction theory,⁶ which is the cornerstone of his system. The third and longest section treats of “acute psychoses and defective states.” Here, with the help of numerous examples, Wernicke develops his revolutionary clinical approach, which has met with only the limited approbation of fellow professionals and has so far not produced a school. Wernicke’s ideas, for all their brilliance, are too narrow: brain anatomy and psychiatric clinics are certainly important for psychopathology, but *psychology* is more important still and this is what is lacking in Wernicke. The danger of dogmatic schematism for anyone who follows in Wernicke’s footsteps, but with less brilliance, is very great. It is devoutly to be hoped, therefore, that this admirable book will produce as few schools as possible.

1907

[893] Albert Moll:⁷ *Der Hypnotismus, mit Einschluss der Hauptpunkte der Psychotherapie und des Occultismus*. 4th enlarged edn., Berlin, 1907. — Moll’s well-known book has now attained nearly twice the size of the first edition. The first, historical section is very full and covers the whole range of the hypnosis movement. The second is a lucid and, didactically speaking, very good introduction to the various forms and techniques of hypnotism, followed by a discussion of the hypnotist’s work and the nature of suggestion. Moll defines it thus: “Suggestion is a process whereby, under inadequate conditions, an effect is obtained by evoking the idea that such an effect will be obtained.” The third part, treating of symptomatology, is very thorough and contains some good criticism. It also covers the very latest phenomena in the domain of hypnotism, including Mme. Madeleine and “Clever Hans.”⁸ It is incomprehensible to me why Moll, in the section on dreams, does not consider Freud’s pioneering researches. Freud is accorded only a few meagre quotations. In his discussion on the relations between certain mental disturbances (catatonia especially) and similar hypnotic states, Moll has overlooked the work of Ragnar Vogt,⁹ which is of significance in this respect. Altogether, the examination of the connection of pathological mental states with hypnosis and related functional phenomena is neither exhaustive nor productive of tangible results, as is the case, incidentally, in all textbooks of hypnotism to date. The case of echolalia described on p. 200 may well be a simple catatonia, and this is true also of a large number of so-called “imitative illnesses” which are generally observed by doctors who have no knowledge of the symptomatology of catatonia. If Moll can blithely speak of great suggestibility during sleep, then the whole concept of suggestibility needs very

drastic revision. In the discussion on the subconscious one again misses the highly important researches of Freud. Section VIII, "Medicine," gives a very valuable and useful account of the influence of "authorities" on the question of hypnosis and its alleged dangers. Discussing hypnotic methods of treatment, Moll also touches on the cathartic method. He bases himself here on the original publications of Breuer and Freud,¹⁰ which Freud meanwhile has long since superseded. His present technique differs somewhat from the way Moll describes it. Recently Löwenfeld¹¹ has given up his negative attitude towards Freud, at least as regards anxiety neurosis. The remaining chapters give a comprehensive account of various psychotherapeutic methods. The forensic significance of hypnotism is also discussed at some length. The final chapter, "The Occult," is a critical survey of the most important "occult" phenomena.

[894] Apart from Löwenfeld's book,¹² Moll's is the best and fullest introduction to hypnotic psychotherapy. It is warmly recommended to all doctors, nerve specialists in particular.

[895] Albert Knapp: *Die polyneuritischen Psychosen*. Weisbaden, 1906. — The first 85 pages are taken up with detailed clinical histories and their epicrises. The following 50 contain a general description of the relevant symptoms, in clear language which makes a rapid orientation possible. The nomenclature is strongly influenced by Wernicke, which will hardly meet with general approval. The preference given to the term "akinetic motility psychosis" for catatonia etc., is hardly intelligible, especially when one considers that it only describes a condition that can take on a totally different appearance the next moment. The book should be especially welcome to psychiatrists.

[896] M. Reichhardt: *Leitfaden zur psychiatrischen Klinik*. Jena, date not given. — This book is a valuable introduction to the elements of psychiatry. The author discusses them under three main heads:

[897] General symptomatology, with clear and precise definitions.

[898] Exploratory methods, with a detailed description of the numerous methods for testing intelligence and apprehension.

[899] Special psychiatry. Here the author confines himself to essentials. On the controversial subject of dementia praecox, the emphasis falls on dementia simplex, catatonia and paranoia, the latter being treated *in globo*, without reference to the special diagnoses of the Kraepelin school, which in practice are irrelevant anyhow. A good index adds to the book's handiness. Apart from the clear exposition, one of its main advantages is the noteworthy restriction to what is essential. The legal definitions of insanity are taken exclusively from German law-books. On the question of intelligence tests, no mention is made of the not unimportant method of reading a fable with free reproduction afterwards. The statement that in country areas

an institution with 1000–1500 beds is enough for a million inhabitants is certainly not true of Switzerland. Besides private institutions, we have in Canton Zurich about 1300 public beds, not nearly enough to meet the demand. For the rest, the book is warmly recommended not only to students, but especially to all doctors called upon to give a judicial opinion on any kind of mental abnormality.

1908

[900] Franz C. R. Eschle: *Grundzüge der Psychiatrie*. Vienna, 1907. — The author—director of the sanatorium at Sinsheim in Baden—has tried to present the fundamentals of psychiatry in the form of a manual, drawing upon his many years of experience as an alienist. **Part I** treats of the nature and development of insanity. He distinguishes, as general forms of psychic abnormality, a distinctive, an affective, and an appetitive insufficiency, corresponding roughly to the old psychology of Kant. This chapter is rather heavy going. The arrangement is far from clear and the style is often tortuous, for instance p. 37: “In hypnotic sleep, which represents the most intense and persistent form of the artificial suggestive insufficiency of the psychosomatic mechanism, Rosenbach holds that the psychic organ is unable to build up the differentiating unity which stands in antithetical relation to the other parts of the body (and to the external world) as the ‘ego,’ although it nevertheless represents this unity,” etc. This but one example among many!

[901] In **Part II**, “Clinical Pictures of Insanity,” the author gives a description of the specific diseases with a great deal of interesting case material and original views which one cannot always endorse, as for instance when he asserts with Rosenbach that a widespread use of hypnosis would lead to a general stultification of the public. His classification of the psychoses is a mixture of old and modern points of view; he groups acute hallucinatory confusion and acute dementia (curable stupidity) with dementia praecox while distinguishing paranoia and paranoid dementia.

[902] **Part III** is a forensic evaluation of doubtful mental conditions. There is a good index of authors and subjects. The book is essentially eclectic and tries to select the best from the old psychiatry and the new and combine them into a unity with a dash of philosophy thrown in. It should therefore prove stimulating reading for doctors in sanatoria who have not kept abreast of the latest developments in psychiatry.

[903] P. Dubois:¹³ *Die Einbildung als Krankheitsursache*. Wiesbaden, 1907. —Dubois presents in generally understandable outline his view of the nature and the treatment of the psychoneuroses. He begins with a clear and illuminating definition of “imagination” and then proceeds to show the pathological effects of imagination with the help of numerous instructive examples. His therapy, likewise derived from this view and clearly expounded, consists essentially in enlightening the patients on the nature of their symptoms and in re-educating their thinking. Let us hope that this

distinguished book will contribute to a general breakthrough of the conception of the psychogenic nature of most neuroses! Like all Dubois' other writings, it is urgently recommended to the practising doctor. Even though the Dubois method may not be successful with every neurosis, it is eminently suited to have a prophylactic effect, so that cases where the symptoms are due to imprudent suggestions on the part of the doctor may gradually become less common. In conclusion Dubois hints at a possible extension of his therapy to the psychoses—but in this matter the alienist is not so optimistic.

[904] Georg Lomer: *Liebe und Psychose*. Wiesbaden, 1907.— Lomer's book is more an example of *belles-lettres* than a scientific evaluation of sexuality and its psychological derivatives. By far the greater part of it is concerned with normal psychosexual processes which it seeks to present to an intelligent lay public. Readers who would like to penetrate deeper must have recourse to Havelock Ellis and Freud. The pathology of sex is discussed in an appendix, with—in comparison with similar productions—a wholesome reserve in the communication of piquant case histories. One could have wished for a rather deeper grasp of the problems of psychosexual pathology, where such excellent preparatory work has been done, as witness the researches of Freud.

[905] E. Meyer: *Die Ursachen der Geisteskrankheiten*. Jena, 1907. — Meyer's book comes at the right time and will be welcomed not only by every psychiatrist but by all those who are interested in the causes of mental illnesses in the widest sense. It also remedies the palpable lack of any comprehensive account of the aetiology of the psychoses. The author discusses in great detail the numerous factors that have to be taken into account in their causation. The chapter on poisonings is written with especial care. In discussing the psychic causes, which are at present the subject of violent controversy, the author displays a calm impartiality, allowing the psychic elements more freedom of play than do certain other views which would like to reduce the whole aetiology to non-psychic causes. One small error needs correcting: Freud and the Zurich school see in the psychological disposition only the material determinants of the later symptoms, but not the sole cause of psychosis. The author has made a singularly good selection from the extensive literature dealing with the question of aetiology. An excellent index assists easy reference.

[906] Sigmund Freud: *Zur Psychopathologie des Alltagslebens*. 2nd enlarged edn., Berlin, 1907.¹⁴ — It is a heartening sign that this important book has now gone into a second edition. It is practically the only major work of Freud's that introduces his ideas into the world with little or no effort, so simply and fluently is it written. Thus it is well suited to initiate the layman (and there are few who are *not* laymen in this field) into the problems of Freudian psychology. It is concerned not with the speculations of theoretical psychology but with psychological case material taken

from everyday life. It is just the apparently insignificant incidents of everyday life that Freud has made the theme of his researches, showing with the help of numerous examples how the unconscious influences our thoughts and actions at every turn in an unexpected way. Many of his examples have an implausible look, but one should not be put off by that, because all unconscious trains of thought in an individual look anything but plausible on paper. The profound truth of Freud's ideas will carry conviction only when one tests them for oneself. Even for those who are not especially interested in psychological matters Freud's book makes stimulating reading; for those who think more deeply, who by inclination or profession are interested in the psychic processes, it is a rich mine of far-sighted ideas which have a significance that can scarcely be estimated at present for the whole range of mental and nervous diseases. In this respect the book is an easy guide to Freud's latest works on hysteria,¹⁵ which despite the deep truth of their subject-matter, or because of it, have hitherto met only with fanatical opposition and intractable misunderstanding. The book is therefore recommended with all urgency to alienists and to nerve specialists in particular.

1909

[907] L. Löwenfeld:¹⁶ *Homosexualität und Strafgesetz*. Wiesbaden, 1908. — This book is the product of the current struggle that has been touched off in Germany by section 175 of the penal code. This section, as is generally known, concerns unnatural vice between men, and also with animals. The author gives a concise history of the clinical concept of homosexuality. He sums up the present state of opinion as follows: "Though homosexuality is an anomaly that may appear in the physical sphere in association with disease and degeneration, in the majority of cases it is an isolated psychic deviation from the norm, which cannot be regarded as pathological or degenerative and is not likely to reduce the value of the individual as a member of society." Section 175, which became law only under the pressure of orthodoxy despite opposition by influential authorities, has so far proved to be not only useless and inhuman, but directly harmful as it offers opportunities for professional blackmail with all its tragic and repulsive consequences. The book gives a very good survey of the whole question of homosexuality.

[908] Karl Kleist: *Untersuchungen zur Kenntnis der psychomotorischen Bewegungsstörungen bei Geisteskranken*. Leipzig, 1908 — The book presents the clinical history of a motility psychosis alias catatonia with a detailed epicritical discussion. The author leans heavily on the views of Wernicke, with the result that the book is concerned chiefly with cerebral localizations. The conclusion reached is that psychomotor disturbances in catatonics are conditioned by two factors, innervatory and psychic. The seat of disease is supposed to be the terminal point of

the cerebellar-cortical tracts, i.e., the frontal cerebral cortex. As the patients occasionally have sensations of strain and fatigue in the performance of the tasks assigned them, and as the psychomotor symptoms are due to a disturbance of the motor reactions coordinated with these sensations, the psychic conditioning factor likewise points to the cerebellar-frontal system. This conclusion is logical if one regards the psychic functional complexes as an appendix of their executive organs from the start. The book is recommended to specialists because of its acute differential-diagnostic analysis of apraxia and related motility disturbances.

[909] Oswald Bumke:¹⁷ *Landläufige Irrtümer in der Beurteilung von Geisteskranken*. Wiesbaden, 1908. — This little book contains more than its title indicates. It is a short and clearly written outline of psychiatry, and while it does not give an altogether elementary description of the psychoses it presupposes some knowledge of the main types—knowledge which almost every practitioner possesses today. On this basis the author discusses questions which are wont to present difficulties to doctors with no psychiatric training in their assessment of mental disturbances. Aetiology, diagnosis, prognosis, and therapy are discussed from this standpoint, the author giving valuable advice and hints from his own practical experience. At the end there is a chapter on the forensic view of the insane.

[910] A comprehensive and handy little book, highly recommended.

[911] Christian von Ehrenfels: *Grundbegriffe der Ethik*. Wiesbaden, 1907. — The author—professor of philosophy in Prague—gives a philosophical but easily understandable account of his basic ethical concepts. His argument culminates in the confrontation between social and individual morality, once more a subject of violent controversy. The conclusion reached, though typical of the general tenor of the book, can hardly be called positive: “Normative morality is identical with correct social morality, the sole proviso being that every individual must be free to modify social morality, not in accordance with his own caprice but in a manner he can defend before the tribunal of the eternal and inscrutable.”

[912] Christian von Ehrenfels: *Sexualethik*. Wiesbaden, 1907.— While the author’s *Grundbegriffe der Ethik* is mainly of theoretical interest, this work is of great practical importance. It is the clearest and best account I know of sexual ethics and its postulates. The author begins with a deeply thought out and lucid presentation of natural and cultural sexual morality. The following chapter, “Contemporary Sexual Morality in the West,” discusses the tremendous conflict between the postulates of natural and cultural sexuality, the socially useful effects of monogamy on the one hand and its shadow-side on the other, prostitution, the double sexual morality of society and its pernicious influence on culture. In his discussion of reform movements the author takes a cautious and reserved stand, as far from Philistine approval of the *status quo* as from certain modern tendencies that would like to pull

down all barriers. Although he has no definite programme of reform (which shows he is no dreamer!), he expresses many liberal views which will surely help to solve our greatest social problem, beginning with the individual. His book, which unlike others of the kind is not a parade of garish nudities veiled in scientific garb, deserves the widest acclaim for its unpretentious and reasonable attempt to find *possible* solutions.

[913] Max Dost: *Kurzer Abriss der Psychologie, Psychiatrie und gerichtlichen Psychiatrie*. Leipzig, 1908. — This little book is a new kind of compendium of psychiatry with special reference to intelligence testing. Psychology comes off rather too lightly. The chapters on psychiatry, however, really offer everything one could expect from a short outline. For the psychiatrist the enumeration of various psychic exploratory methods will be particularly welcome. It will be hard to find so handy an account anywhere in the literature.

[914] Alexander Pilcz: *Lehrbuch der speziellen Psychiatrie für Studierende und Aerzte*. 2nd revised edn., Leipzig and Vienna, 1909. — Not every branch of medicine is in such an infantile state of development as psychiatry, where a textbook, which ought to have general validity, is only of local significance. When one considers that dementia praecox is a disease which in Zurich accounts for half the admissions, in Munich is steadily decreasing (as a result of new theories), is not common in Vienna, is rare in Berlin and in Paris hardly occurs at all, the reviewer of a psychiatric textbook must disregard the Babylonian confusion of tongues and concepts and simply accept the standpoint of the textbook in question. Pilcz's book, now in its 2nd edition, is an admirable work which fulfils its purpose. It is excellently written, and contains everything essential. The material is clearly arranged, the exposition terse and precise. Highly recommended.

[915] W. von Bechterew: *Psyche und Leben*. 2nd edn., Wiesbaden, 1908. — This book does not treat of psychological problems on the basis of a wide knowledge of the literature, as the title might suggest, but deals with psychophysiological relations in general from the theoretical philosophical side, and then goes on to discuss the relation of energy to the psyche and of the psyche to physiology and biology. The style is aphoristic; the chapters, thirty-one in number, are only loosely connected. The chief value of the book lies in its numerous reports of the views of a great variety of specialist researchers and in its literary references. Readers who want a synthetic or critical clarification of the psychophysiological problems will seek for it in vain. But for anyone who seeks orientation in this interesting field and its complicated, widely dispersed literature this stimulating book is highly recommended.

[916] M. Urstein: *Die Dementia praecox und ihre Stellung zum manisch-depressiven Irresein*. Vienna, 1909. — As the title indicates, this is a clinical examination of dementia praecox diagnosis, a topic that has come once more to the forefront because of the recent swing towards the Kraepelin school. Not everyone will be able to

imitate the ease with which manic-depressive insanity is now distinguished from dementia praecox, and Urstein is one of them. He sharply criticizes the work of Wilmann and Dreyfus, who would like to restrict dementia praecox diagnosis in favour of manic-depressive insanity. His book can count on the decided sympathy of all who doubt the thoroughness of Kraepelin's diagnostics, and who cannot go along with the idea that a catatonic is from now on a manic-depressive. Pages 125 to 372 are padded out with case histories, an unnecessary appendage in view of the specialist readership for which the book is intended.

[917] Albert Reibmayer: *Die Entwicklungsgeschichte des Talentes und Genies*. Munich, 1908. — Only the first volume of the book is available at present, but despite this drawback it is already apparent that it is a broad and comprehensive study. The present volume is essentially a theoretical, constructive survey of the problem, which naturally has extensive ramifications into biology and history. If the second volume provides the necessary biographies and suchlike material, we shall have in Reibmayer's book an important work meriting the widest attention.

[918] P. Näcke:¹⁸ *Über Familienmord durch Geisteskranke*. Halle, 1908. — The book is a monograph on family murder. The author presents 161 cases, classified according to their respective peculiarities. He is of the opinion that family murder is now on the increase. He distinguishes between "complete" and "incomplete" family murder. The first is more common in the case of relatively sane individuals; the second more common with the insane. The murderers are usually in the prime of life. The victims of the men are usually their wives, of the women their children. The commonest causes are chronic alcoholism, paranoia, and epilepsy in men; melancholy, paranoia, and dementia praecox in women.

[919] Th. Becker: *Einführung in die Psychiatrie*. 4th revised and enlarged edn., Leipzig, 1908. — This handy little book is a clear and concise introduction to psychiatry. With regard to the classification of the psychoses the author is conservative, allowing a good deal of room for paranoia alongside dementia praecox. The book has much to recommend it as an "introduction" if one disregards the chapter on hysteria, which no longer meets with modern requirements.

[920] A. Cramer: *Gerichtliche Psychiatrie*. 4th revised and enlarged edn., Jena, 1908. — Cramer's guide to judicial psychiatry, now in its fourth edition, is one of the best of its kind; it is thorough, comprehensive, and, compared with Hoche's manual,¹⁹ has the great advantage of consistent exposition. As everywhere in psychiatry, the lack of a consistent classification is to be regretted; this is not the fault of the author but of the discipline itself. Were it not for this inconvenience Cramer's book could be generally recommended; as it is, the beginner can rely on it completely only if he is disposed to trust its particular approach. For the rest, the book will prove useful in the hands of psychiatric experts.

[921] August Forel:²⁰ *Ethische und rechtliche Konflikte im Sexualleben in- und ausserhalb der Ehe*. Munich, 1909. — The author introduces his book with the following words: “The following pages are for the most part an attack, based on documentary material, on the hypocrisy, the dishonesty and cruelty of our present-day morality and our almost non-existent rights in matters of sexual life.” From which it is apparent that this work is another contribution to the great social task to which Forel has already rendered such signal service. Essentially it presents a large number of psychosexual conflicts of a moral or judicial nature, knowledge of which is indispensable not only for the nerve specialist, but for every doctor who has to advise his patients in the difficult situations of life.

THE SIGNIFICANCE OF FREUD'S THEORY FOR NEUROLOGY AND PSYCHIATRY¹

[922] In medical terms, Freud's achievements are on the whole limited to the fields of hysteria and obsessional neurosis. His investigations begin with the psychogenetic explanation of the hysterical symptom, an explanation formulated by Möbius and experimentally tested by Pierre Janet. According to this point of view, every physical symptom of a hysterical nature is causally connected with a corresponding psychological event. This view can be corroborated by a critical analysis of the hysterical symptom, which becomes intelligible only when the psychological factor is taken into account, as exemplified by the many paradoxical phenomena of cutaneous and sensory anesthetics. But the theory of psychogenesis cannot explain the *individual determinants* of the hysterical symptom. Stimulated by Breuer's discovery of a psychological connection, Freud bridged this large gap in our knowledge by his method of psychoanalysis, and he demonstrated that a determining psychological factor can be found for every symptom. The determination always proceeds from a *repressed feeling-toned complex of representations*. (Lecturer illustrates this statement with a few case histories taken partly from Freud, partly from his own experience.) The same principle applies to the obsessional neurosis, the individual manifestation of which is determined by very similar mechanisms. (Lecturer adduces a number of examples.) As Freud maintains, sexuality in the widest sense plays a significant role in the genesis of a neurosis, quite understandably so, since sexuality plays an important role in the intimate life of the psyche. Psychoanalysis, in addition, has in many cases an unmistakable therapeutic effect, which however does not mean that it is the only way of treating a neurosis. By dint of his theory of psychological determination, Freud has become very important for psychiatry, especially for the elucidation of the symptoms, so far completely unintelligible, of dementia praecox. Analysis of this disease uncovers the same psychological mechanisms that are at work in the neuroses, and thus makes us understand the individual forms of illusionary ideas, hallucinations, paraesthesias, and bizarre hebephrenic fantasies. A vast area of psychiatry, up until now totally dark, is thus suddenly illuminated. (Lecturer relates two case histories of dementia praecox as examples.)

REVIEW OF STEKEL: "NERVÖSE ANGSTZUSTÄNDE UND IHRE BEHANDLUNG"¹

[923] The book contains a presentation of states of nervous anxiety, buttressed by an abundance of case material: in **Part I**, Anxiety Neuroses, in **Part II**, Anxiety Hysteria. The clinical boundaries for either group are flung far afield, taking in much more than existing clinical methods have accounted for. Anxiety neurosis, especially, is enriched by many new categories of disease, the symptoms of which are taken to be *equivalents of anxiety*. By its very nature anxiety hysteria has fluctuating boundaries and tends to merge with other forms of hysteria. **Part III** is concerned with the general diagnostics of anxiety states as well as general therapy and, specifically, the technique of psychotherapy. Now, what makes the book especially attractive is the fact that Stekel, a pupil of Freud, very laudably makes the first attempt to enable a larger medical public to gain insight in the psychological structure of the neuroses. In his case histories, Stekel does not confine himself to presenting only the surface (as has hitherto been usual), but, following the most intimate individual reactions of the patient, gives a penetrating picture of the psychogenesis in each case and its further progress during the therapeutic effect of the psychoanalysis. He analyses many cases with great skill and rich experience and in great detail, while others are presented only in psychological outline, which the psychological layman may have difficulty in following. Such outline presentations, unfortunately, cannot be avoided if the book is not to become inordinately long, even though such cases are hard to understand and can easily lead to misconstruction and to the reproach that the author indulges in rash interpretation. On the basis of this method, which specifically considers every individuality on its own terms, Stekel can demonstrate that without exception states of nervous anxiety are determined by psychosexual conflicts of the most intimate nature, thereby once more confirming Freud's assertion that neurotic anxiety is nothing but a converted sexual desire.

[924] Up to now we suffered from a lack of case material in the light of Freudian analysis. To an extent Stekel's book fills this gap. It is very readable and therefore must be highly recommended to all practising physicians, not merely to specialists, for open and hidden neuroses are legion and every physician has to cope with them.

EDITORIAL PREFACE TO THE "JAHRBUCH"¹

[925] In the spring of 1908 a private meeting was held in Salzburg of all those who are interested in the development of the psychology created by Sigmund Freud and in its application to nervous and mental diseases. At this meeting it was recognized that the working out of the problems in question was already beginning to go beyond the bounds of purely medical interest, and the need was expressed for a periodical which would gather together studies in this field that hitherto have been scattered at random. Such was the impetus that gave rise to our *Jahrbuch*. Its task is to be the progressive publication of all scientific papers that are concerned in a positive way with the deeper understanding and solution of our problems. The *Jahrbuch* will thus provide not only an insight into the steady progress of work in this domain with its great future, but also an orientation on the current state and scope of questions of the utmost importance for all the humane sciences.

DR. C. G. JUNG

MARGINAL NOTES ON WITTELS: "DIE SEXUELLE NOT"¹

[926] This book is written with as much passion as intelligence. It discusses such questions as abortion, syphilis, the family, the child, women, and professions for women. Its motto is: "Human beings must live out their sexuality, otherwise their lives will be warped." Accordingly, Wittels lifts up his voice for the liberation of sexuality in the widest sense. He speaks a language one seldom hears, the language of unsparing, almost fanatical truthfulness, that falls unpleasantly on the ear because it tears away all shams and unmasks all cultural lies. It is not my business to pass judgment on the author's morals. Science has only to listen to this voice and tacitly admit that it is not a lone voice crying in the wilderness, that it could be a leader for many who are setting out on this path, that we have here a movement rising from invisible sources and swelling into a mightier current every day. Science has to test and weigh the evidence—and understand it.

[927] The book is dedicated to Freud and much of it is based on Freud's psychology, which is in essence the scientific rationalization of this contemporary movement. For the social psychologist the movement is and remains an intellectual problem, while for the social moralist it is a challenge. Wittels meets this challenge in his own way, others do so in theirs. We should listen to them all. Nowhere is the warning more in place that on the one hand we should refrain from enthusiastic applause, and on the other not kick against the pricks in blind rage. We have to realize, quite dispassionately, that whatever we fight about in the outside world is also a battle in our inner selves. In the end we have to admit that mankind is not just an accumulation of individuals utterly different from one another, but possesses such a high degree of psychological collectivity that in comparison the individual appears as merely a slight variant. How shall we judge this matter fairly if we cannot admit that it is also our own problem? Anyone who can admit this will first seek the solution in himself. This, in fact, is the way all great solutions begin.

[928] Most people, however, seem to have a secret love of voyeurism; they gaze at the contestants as though they were watching a circus, wanting to decide immediately who is finally right or wrong. But anyone who has learnt to examine the background of his own thoughts and actions, and has acquired a lasting and salutary impression of the way our unconscious biological impulses warp our logic, will soon lose his delight in gladiatorial shows and public disputation, and will perform them in himself and with himself. In that way we preserve a perspective that is particularly needful in an age when Nietzsche arose as a significant portent. Wittels will surely not remain

alone; he is only the first of many who will come up with “ethical” conclusions from the mine of Freud’s truly biological psychology—conclusions that will shake to the marrow what was previously considered “good.” As a French wit once remarked, of all inventors moralists have the hardest lot, since their innovations can only be immoralities. This is absurd and at the same time sad, as it shows how out of date our conception of morality has become. It lacks the very best thing that modern thought has accomplished: a biological and historical consciousness. This lack of adaptation must sooner or later bring about its fall, and nothing can stop this fall. And here I am reminded of the wise words of Anatole France: “And, although the past is there to point out to them ever-changing and shifting rights and duties, they would look upon themselves as dupes were they to foresee that future humanity is to create for itself new rights, duties and gods. Finally, they fear disgracing themselves in the eyes of their contemporaries, in assuming the horrible immorality which future morality stands for. Such are the obstacles to a quest of the future.”²

[929] The danger of our old-fashioned conception of morality is that it blinkers our eyes to innovations which, however fitting they may be, always carry with them the odium of immorality. But it is just here that our eyes should be clear and far-seeing. The movement I spoke of, the urge to reform sexual morality, is not the invention of a few cranky somnambulists but has all the impact of a force of nature. No arguments or quibbles about the *raison d’être* of morality are any use here; we have to accept what is most intelligent and make the best of it. This means tough and dirty work. Wittels’ book gives a foretaste of what is to come, and it will shock and frighten many people. The long shadow of this fright will naturally fall on Freudian psychology, which will be accused of being a hotbed of iniquity. To anticipate this I would like to say a word in its defence now. Our psychology is a science that can at most be accused of having discovered the dynamite terrorists work with. What the moralist and general practitioner do with it is none of our business, and we have no intention of interfering. Plenty of unqualified persons are sure to push their way in and commit the greatest follies, but that too does not concern us. Our aim is simply and solely scientific knowledge, and we do not have to bother with the uproar it has provoked. If religion and morality are blown to pieces in the process, so much the worse for them for not having more stamina. Knowledge is a force of nature that goes its way irresistibly from inner necessity. There can be no hushing up and no compromises, only unqualified acceptance.

[930] This knowledge is not to be identified with the changing views of the ordinary medical man, for which reason it cannot be judged by moral criteria. This has to be said out loud, because today there are still people claiming to be scientific who extend their moral misgivings even to scientific insights. Like every proper science, psychoanalysis is beyond morality; it rationalizes the unconscious and so fits the

previously autonomous and unconscious instinctual forces into the psychic economy. The difference between the position before and afterwards is that the person in question now really *wants* to be what he is and to leave nothing to the blind dispensation of the unconscious. The objection that immediately arises, that the world would then get out of joint, must be answered first and foremost by psychoanalysis; it has the last word, but only in the privacy of the consulting room, because this fear is an individual fear. It is sufficient that the goal of psychoanalysis is a psychic state in which “you ought” and “you must” are replaced by “I will,” so that, as Nietzsche says, a man becomes master not only of his vices but also of his virtues. Inasmuch as psychoanalysis is purely rational—and it is so of its very nature—it is neither moral nor antimoral and gives neither prescriptions nor any other “you oughts.” Undoubtedly the tremendous need of the masses to be led will force many people to abandon the standpoint of the psychoanalyst and to start “prescribing.” One person will prescribe morality, another licentiousness. Both of them cater to the masses and both follow the currents that drive the masses hither and thither. Science stands above all this and lends the strength of its armour to Christian and anti-Christian alike. It has no confessional axe to grind.

[931] I have never yet read a book on the sexual question that demolishes present-day morality so harshly and unmercifully and yet remains in essentials so true. For this reason Wittels’ book deserves to be read, but so do many others that deal with the same question, for the important thing is not the individual book but the problem common to them all.

REVIEW OF WULFFEN: "DER SEXUALVERBRECHER"¹

[932] Wulffen's comprehensive account of sexual misdemeanours is not confined merely to criminal case histories but seeks to get at the psychological and social foundations of the offence. Two hundred and fifty pages alone are devoted to sexual biology in general, sexual psychology, characterology, and pathology. In the chapter on sexual psychology the author himself will surely deplore the absence of psychoanalytic viewpoints. The other chapters on criminology, being written by an experienced criminologist, are of great interest and very stimulating to the researcher in this field. The illustrations are uniformly good, some of them of great psychological value.

[933] For a future psychoanalytic investigation of this subject Wulffen's book should be a most valuable source alongside the compilations of Pitaval.²

ABSTRACTS OF THE PSYCHOLOGICAL WORKS OF SWISS AUTHORS (to the end of 1909)¹

[934] This compilation contains among other things all works of the Zurich school that are either directly concerned with psychoanalysis or touch upon it in essentials. Works with a clinical or psychological content not concerned with psychoanalysis have been omitted. Abraham's works, including those written in Zurich, are abstracted in *Jahrbuch* 1909. A few works by German authors that come close to the findings in *Diagnostische Assoziationsstudien* are noted in passing. A consideration of the critical and oppositional literature is unfortunately impossible as long as the scientific soundness of our principles of research is called in question.

[935] Bezzola (formerly Schloss Hard, Ermatingen): "Zur Analyse psychotraumatischer Symptome," *Journ. f. Psychol., u. Neurol.*, VIII (1907). — The author still bases himself entirely on the trauma theory. His procedure corresponds in detail to the Breuer-Freud method, which was called "cathartic." The author has no real grasp of later methods. He recommends a modification which he calls *psychosynthesis*. "Every psychically effective experience reaches consciousness in the form of dissociated excitations of the senses. In order to become concepts, these excitations have to be associated among themselves and also with consciousness. But in consequence of the narrow range of consciousness, this process cannot be fully completed, certain components remain in the unconscious or become conscious by false association. Psychosynthesis consists in reinforcing these isolated conscious components by empathy until the components subconsciously associated with them are reactivated, whereupon the development of the whole process reaches consciousness and the dissolution of the psychotraumatic symptoms ensues." This theory is supported by a series of cases. Naturally they are presented with total blindness for the actual psychosexual background. The epilogue contains an attack on Freud's sexual theory in the usual nervous tone and with arguments to match.

Binswanger, see Jung: *Diagnost. Assoz. stud.*, XI.

[936] Bleuler (Zurich): "Freudsche Mechanismen in der Symptomatologie von Psychosen," *Psychiatr.-neurol. Wochenschrift*, 1906.— Analyses of symptoms and associations in various psychotic states.

[937] Bleuler and Jung: "Komplexe und Krankheitsursache bei Dementia praecox," *Zentralbl. f. Nervenheilkunde u. Psychiatrie*, XXXI (1908), 220ff. —The authors seek to clarify their aetiological standpoint in the light of Meyer's critique of Jung's

theory of dementia praecox. They first demonstrate that the new conception is not aetiological but symptomatological. Questions of aetiology are complicated and take second place. Bleuler makes a rigorous distinction between the physical process of disease and the psychological determination of the symptoms, and in view of the importance of the former he attaches no aetiological significance to the latter. As against this, Jung leaves the question of the ideogenic aetiology open, since in physical processes of disease the physical correlate of affect can play an aetiological significant role.

[938] Bleuler: *Affektivität, Suggestibilität, Paranoia*. Halle, 1906.— In this book Bleuler makes a broadminded attempt to provide a general psychological description and definition of affective processes, and to correlate them with an outline of Freudian psychology. The conception of attention and suggestibility as special instances or partial manifestations of affectivity is a pleasing simplification of the Babylonian confusion of tongues and concepts prevailing in psychology and psychiatry today. Even though the last word has not been spoken, Bleuler offers us a simple interpretation, based on experience, of complicated psychic processes. Psychiatry is in urgent need of this since the psychiatrist is *forced* to think and operate with complicated psychic entities. We could easily wait for a hundred years until we got anything of this kind from experimental psychology. With affectivity as a basis, Bleuler devotes an uncommonly important chapter to the inception of paranoid ideas, demonstrating in four cases that a feeling-toned complex lies at the root of the delusion.

[939] The reviewer must rest content with this general sketch of the book's scope and tendency. Its wealth of detail does not lend itself to brief summation. We can say that Bleuler's book is the best general description to date of the psychology of affect. It is warmly recommended to everyone, especially the beginner.

[940] _____. "Sexuelle Abnormitäten der Kinder," *Jahrbuch der schweiz. Gesellschaft f. Schulgesundheitspflege*, IX (1908), 623ff. — A lucid description of sexual perversions in children. Frequent reference is made to Freud's psychology. The author favours sexual enlightenment, not in the form of mass sex education at school, but at home, the right moment being tactfully chosen by the parents.

_____. See Jung: *Diagnost. Assoz. stud.*, V.

[941] Bolte (Bremen): "Assoziationsversuche als diagnostisches Hilfsmittel," *Allgemeine Zeitschrift f. Psychiatrie*, LXIV (1907).— The author demonstrates the use of the association experiment for diagnostic purposes. He concurs in essentials with the basic findings of the *Diagnostische Assoziationsstudien*. Some interesting examples bring the ideas in this book vividly to life.

- [942] Chalewsky (Zurich): "Heilung eines hysterischen Bellens durch Psychoanalyse," *Zentralbl. f. Nervenheilkunde u. Psychiatrie*, XX (1909). [Abstract, by Maeder, omitted.]
- [943] Claparède (Geneva): "Quelques mots sur la définition de l'hystérie," *Archives de psychologie*, VII (1908), 1969ff. —The author criticizes with great skill the recent conception of hysteria inaugurated by Babinski. In the concluding chapter he develops his own views into a conception which itself consists of a series of question marks. He acknowledges the importance of Freudian repression and endows it with biological significance. Psychoanalytic resistance, of which he has gained first-hand experience, is for him a defence reaction. He takes the same view of globus [hystericus = lump in the throat], vomiting, spasms in the oesophagus, lying, simulation, etc. He sees bodily symptoms as a revivification of ancestral reactions that were once useful. Thus the hysterogenic mechanism is conceived as a "tendance à la réversion," an atavistic mode of reaction. Its infantile character and the "disposition ludique" (play tendency) seem to him to support this theory. His arguments lack the necessary empirical basis which of course can only be acquired through psychoanalysis.
- [944] Eberschweiler (Zurich): "Untersuchungen über die sprachliche Komponente der Assoziation," *Allgemeine Zeitschrift für Psychiatrie*, 1908. — A painstaking and careful investigation prompted by the reviewer. One finding is of particular interest for complex psychology: it has been shown that in the association experiment certain vowel sequences occur, i.e., successive reactions have the same vowel sound. Now if these "perseverations" are correlated with complex-indicators, we find that, given an average percentage of 0.36 complex-indicators per reaction, 0.65 fall on a word in the vowel sequence. If we take the two associations preceding the vowel sequences without clang affinity, we reach the following result:
- a) Association without vowel sequence: 0.10 complex-indicators.
 - b) Association without vowel sequence: 0.58 complex-indicators.
1. Beginning of vowel sequence (association with vowel sound perseverating in the ensuing series): 0.91 complex-indicators.
 - 2nd term in the vowel sequence: 0.68.
 - 3rd term in the vowel sequence: 0.10.
 - 4th term in the vowel sequence: 0.05.
- [945] It is evident that after complex-disturbances there is a distinct tendency to clang perseverations, and this is an important finding as regards the mechanism of punning and rhyming.
- [946] Flournoy (Geneva): *Das Indes à la Planète Mars. Étude sur un cas de somnambulisme avec glossolalie*. 3rd edn., Paris, 1900.— "Nouvelles observations

sur un cas de somnambulisme avec glossolalie,” *Archives de psychologie*, I (1901). — Flournoy’s comprehensive and extremely important work on a case of hysterical somnambulism contributes valuable material on fantasy systems and merits the attention not only of psychoanalysts but also of the general public. In presenting his case Flournoy comes very close to certain of Freud’s views, though no use could be made of his more recent discoveries.

[947] Frank Zurich: “Zur Psychoanalyse” (Festschrift for Forel), *Journ. f. Psychol, u. Neurol.* XIII (1908). — After a short historical introduction based on the studies by Breuer and Freud, the author expresses his regret that Freud has abandoned the original method without giving his reasons for so doing. Attentive reading of Freud’s subsequent writings discloses soon enough why he preferred the perfected technique to the originally imperfect one. The author restricts himself to the use of the original cathartic method in conjunction with hypnosis, and his case material proves that he is working with a valuable, practically useful method which yields rewarding results. The inevitable attack on Freud’s theory of sexuality is consequently set forth in more temperate tones. The author poses the question: “Why should just the sexual affects among the many others with which the psyche is endowed give rise to disturbances, or is the sexual affect supposed to be the root of all others?” (The role of sexuality in the neuroses was not invented *a priori*, but was discovered empirically through the use of psychoanalysis, and this is something quite different from the cathartic method.) The author does not use psychoanalysis because “a practising physician should not be obliged, in each case, to carry the psychoanalysis through to its very end for theoretical reasons only.” This obligation exists nowhere, but for *practical* reasons one has to go further than one did in 1895; had the method of that time accomplished everything, there would have been no need for going further. The author gained the impression that Freud mastered hypnosis and suggestion very well in theory, but by no means perfectly in actual practice. “I can understand his constant change of method only on the supposition that, because of his *insufficiently thorough hypnotic treatments and their unsatisfactory results*, he as a theoretician, was constantly trying to find new methods.” Reviewer’s italics. A little earlier in his paper, the author says that “Freud has relinquished these methods *in spite of his successes*.” In connection with this contradiction it should be noted that Frank *utterly ignores* Freud’s later works, as well as the writings of other authors and the Zurich Clinic, otherwise he could not possibly assert—in 1908!—that the cathartic method and its results remained “unnoticed” and only “isolated verifications” were attempted.

[948] (The reviewer cannot refrain from pointing out how simple it is to obtain information on these seemingly difficult problems. If, for instance, an author is faced with the problem why Freud may have given up hypnosis, he need only compose a

letter to Professor Freud and inquire about it. On this point the reviewer is insistent because it is the basic sickness of German psychiatry that one is never eager to *understand*, but only to *misunderstand*. In these matters a *personal discussion* is needed in order to eliminate all unnecessary difficulties and misunderstandings. If this principle, which is fully accepted in America, were acknowledged on our continent, we would not see so many otherwise deserving authors making fools of themselves by their criticism, which is frequently couched in a language that renders any reply impossible.)

Fürst, see Jung: *Diagnost. Assoz. stud.*, X.

- [949] Hermann (Galkhausen): "Gefühlsbetonte Komplexe im Seelenleben des Kindes, im Alltagsleben und im Wahnsinn," *Zeitschrift für Kinderforschung*, XIII, 129–43. — Clearly written introduction to the theory of complexes and its application to various normal and pathological psychic states.
- [950] Isserlin (Munich): "Die diagnostische Bedeutung der Assoziationversuche," *Münchener medizinische Wochenschrift*, no. 27 (1907). — In this critical account of the association studies in Zurich, the author acknowledges the existence of several important findings. But where Freudian psychology begins, his approval ends.
- [951] Jung (Zurich): *Zur Psychologie und Pathologie sogenannter okkulten Phänomene*.² Leipzig 1902. — Besides clinical and psychological discussions on the nature of hysterical somnambulism, this work contains detailed observations on a case of spiritualistic mediumship. The splitting of the personality derives from its infantile tendencies and the fantasy systems are found to be rooted in sexual wish-deliria. Examples of neurotic automatisms include a case of cryptomnesia which the author discovered in Nietzsche's *Zarathustra*.
- [952] _____. "Ein Fall von hysterischem Stupor bei einer Untersuchungsgefangenen,"³ *Journ. f. Psychol, u. Neurol.*, I (1902).— Description of the patient's pathological intention, wish to be ill, Freudian repression of anything unpleasant, and wish-fulfilling delusions in a case of the Ganser-Raecke twilight state.
- [953] _____. "Die psychopathologische Bedeutung des Assoziationsexperimentes,"⁴ *Archiv für Kriminalanthropologie*, XX (1906), 145ff. — General introduction to the association experiment and the theory of complexes.
- [954] _____. "Experimentelle Beobachtungen über das Erinnerungsvermögen,"⁵ *Zentralbl. f. Nervenheilkunde u. Psychiatrie*, XXVIII (1905), 653ff. — The author describes the reproduction procedure he himself inaugurated. If, on completion of an association experiment, the subject is asked whether he can remember his previous reaction to each of the stimulus words, it is found that the forgetting usually occurs at or immediately after complex-disturbances. Hence it is a "Freudian forgetting." The procedure is of practical value in pin-pointing complex-indicators.

[955] _____. “Die Hysterielehre Freuds. Eine Erwiderung auf die Aschaffenburgsche Kritik,”⁶ (*Münchener medizinische Wochenschrift*, LIII:47 (1906). — As the title indicates, this is a piece of polemic the aim of which is to induce our opponent to get better acquainted with the psychoanalytic method before judging it. Today this paper is merely of historical value, marking, we might say, the starting-point of the now flourishing Freudian movement.

[956] _____. “Die Freudsche Hysterietheorie,”⁷ *Monatsschrift f. Psychiatrie u. Neurologie*, XXIII:4 (1908), 310ff. — A report written at the request of the president of the International Congress for Psychiatry in Amsterdam, 1907. The author confines his remarks to the most elementary principles in accordance with his knowledge at that time, which since then has been considerably enlarged with increasing experience. Historically, Freud’s theory may be regarded as a transformation of the cathartic method into psychoanalysis. The psychoanalytic conception of hysteria is illustrated with the help of a case which may serve as a paradigm. Summary (abbreviated): Certain precocious sexual activities of a more or less perverse nature grow up on a constitutional basis. At puberty, the fantasies tend in a direction constellated by the infantile sexual activity. The fantasies lead to the formation of complexes of ideas that are incompatible with the other contents of consciousness and are therefore repressed. This repression takes with it the transference of libido to a love-object, thus precipitating a great emotional conflict which then provides occasion for the outbreak of actual illness.

[957] _____. “Associations d’idées familiales”⁸ (avec 5 graphiques), *Archives de psychologie*, VII (1907). — With the help of Fürst’s material (see *Diagnostische Assoziationsstudien*, X) the author evaluates the average difference between various types of association. The results are given in percentages, with graphs.

[958] _____. “L’analyse des rêves,”⁹ *Année psychologique*, published by Alfred Binet, V (1909), 160ff. — Outline of the elements of Freud’s interpretation of dreams, based on examples from the author’s own experience.

[959] _____. *Über die Psychologie der Dementia praecox*.¹⁰ Halle, 1907. — The book consists of five chapters:

- I. Critical survey of theoretical views on the psychology of dementia praecox, as found in the literature up to 1909. In general, a central disturbance is assumed, given different names by different authors, some of whom also mention “fixation” and the “splitting-off of sequences of ideas.” Freud was the first to demonstrate the psychogenic mechanism of paranoid dementia.
- II. The feeling-toned complex and its general effects on the psyche. A distinction is made between the acute and the chronic effects of the complex, i.e., between the immediate

and long-lasting assimilation of its contents.

- III. The influence of the feeling-toned complex on the valency of associations. This question is discussed in some detail, the main accent falling on the biological problem of working through the complex and of psychological adaptation to the environment.
- IV. Dementia praecox and hysteria: a parallel. A comprehensive description of the similarities and differences of both diseases. Summary: Hysteria contains as its innermost core a complex that can never be overcome completely, though the possibility of overcoming it is present *in potentia*. Dementia contains a complex that has become permanently fixed and can never be overcome.
- V. Analysis of a case of paranoid dementia as a paradigm. An absolutely typical case of an elderly patient, presumed to be imbecilic, who produced masses of neologisms that could be satisfactorily explained under analysis and confirm the content of the preceding chapters.

[960] The book has been translated into English by Peterson and Brill, with an introduction by the translators. Title: C. G. Jung: *The Psychology of Dementia Praecox*. Nervous and Mental Diseases Monograph Series No. 3. Authorized translation with an introduction by Frederick Peterson, M.D., and A. A. Brill, Ph.B., M.D. New York, 1909.

[961] _____. *Diagnostische Assoziationsstudien*. Beiträge zur experimentellen Psychopathologie. Edited by C. G. Jung. Vol. I. [Leipzig,] 1906.¹¹ — This volume contains a selection of works from the Zurich Clinic on association and the association experiment which were previously published separately in the *Journal für Psychologie und Neurologie*. Quite apart from their psychological viewpoint, these works are of practical and medical interest because it was from these researches that the diagnostic association experiment was developed, an experiment which furnishes us with a quick and certain clue to the most important of the complexes. The diagnostic use of the experiment is of primary importance; of secondary importance is its use as a clinical aid to differential diagnosis in very many cases where the diagnosis is still uncertain. [Contents as follows.]

[962] Preface: by Professor Bleuler: “Über die Bedeutung von Assoziationsversuchen,” pp. 1–6.—Verbal association is one of the few psychological products that can be evaluated experimentally. Much may be expected from these experiments because the whole psychic past and present, with all their experiences and aspirations, are reflected in the associative activity. It is an “index of all psychic processes, and we need only decipher it in order to know the whole man.”

[963] I. C. G. Jung and Franz Riklin (Zurich): “Experimentelle Untersuchungen über Assoziationen Gesunder,”¹² pp. 7–145.— The aim of this paper was to collect and present a large amount of associations of normal subjects. In order to evaluate the material statistically, a system of classification was needed that would represent an extension and improvement of the Kraepelin-Aschaffenburg system. The system adopted by the two authors follows logical linguistic principles and allows a statistical evaluation which, though imperfect, is nevertheless sufficient for present purposes. The first question to be discussed was whether and if so what types of reaction occur in the normal state. It was found that, on average, educated subjects exhibit a shallower type of reaction than do the uneducated; further, that the subjects fall into two main types, which shade off into each other: an objective and an egocentric type. The first reacts with few signs of emotion, the second with many. The second type is of particular interest from the practical standpoint and falls into two further subdivisions: the so-called constellation or *complex-constellation type* and the *predicate type*. The first tries to suppress emotions, the second to display them.

[964] Fatigue, somnolence, alcoholic intoxication, and mania produce a shallow type of reaction. The shallowness is due primarily to disturbance of attention in these states. This was proved by conducting a special experiment designed to distract the subject’s attention and then continuing the association test under these conditions. The experiments yielded positive results.

[965] II. K. Wehrlin (Zurich): “Über die Assoziationen von Imbezillen und Idioten,” pp. 146–174. — The author reports the results of his association experiments with 13 imbeciles. The associations of the most feeble-minded exhibit a distinct type known as the *definition type*. Characteristic reactions:

Winter: consists of snow.

Singing: consists of notes and song-books.

Father: member beside the mother.

Cherry: a garden thing.

[966] Imbeciles thus display an extraordinarily intense attitude to the intellectual meaning of the stimulus word. It is characteristic that this type is found precisely among the feeble-minded.

[967] III. C. G. Jung: “Analyse der Assoziationen eines Epileptikers.”¹³ pp. 175–92. — The associations of this epileptic clearly belong to the definition type, having an awkward and cumbersome character that confirms and supplements the subject’s own reaction:

Fruit: that is a fruit, a fruity fruit.

Strong: am powerful, that's strong.

Jolly: I'm jolly. I'm merry.

[968] There are also an extraordinary number of feeling-toned, egocentric associations that are expressed undisguised. Certain indications support the conjecture that the epileptic feeling-tone has a markedly perseverating character.

[969] V. C. G. Jung: "Über das Verhalten der Reaktionszeit beim Assoziationsexperimente."¹⁴ pp. 193–228. — The hitherto unknown reasons for the abnormal prolongation of certain reaction-times are here investigated, with the following results: Educated subjects react, on average, quicker than the uneducated. Reaction-time of female subjects is, on average, considerably longer than that of male subjects. The grammatical quality of the stimulus word has a definite influence on reaction-time, and so has the logical linguistic quality of the association. *Reaction-times exceeding the probable mean are for the most part caused by the interference of an unconscious repressed complex.* Hence they are an important aid in the discovery of repressed complexes. This is documented with numerous examples of analyses of associations that have been constellated in this way.

[970] V. E. Bleuler: "Bewusstsein und Assoziation." pp. 229–57.— Drawing upon literary as well as case material, this paper sets out to prove that "so far as has been observed, no sharp distinction can be made between conscious and unconscious," and that the same functional structures and mechanisms that we find in our consciousness can be shown to exist outside it and to influence the psyche just as much as the analogous conscious processes. "In this sense there are unconscious sensations, perceptions, conclusions, feelings, fears and hopes, which differ from their conscious counterparts only because the quality of consciousness is absent." B. cites in particular the cases of multiple personality and remarks that we should not speak merely of *an* unconscious, but that an almost infinite number of different unconscious groupings is possible. The grouping of memory elements into different personalities is due without exception to the overriding influence of affects.

[971] B. regards the quality of consciousness as something subsidiary, since psychic processes need to become conscious only under certain conditions, that is to say when they enter into association with "those ideas, sensations, strivings which at a given moment constitute our personality."

[972] VI. Jung: "Psychoanalyse und Assoziationsexperiment,"¹⁵ pp. 258–81. — This paper still shows the strong influence of the original Breuer-Freud theory of neurosis, namely, the theory of the psychic trauma. Neurotic symptoms are essentially symbols

of repressed complexes. Disturbed reactions in the association experiment reveal the words and things that lead directly to the unknown complex. Thus far the experiment can be a valuable aid in analysis. This possibility is discussed by means of a practical example, a case of obsessional neurosis. The building up of disturbed reactions into a legend proves the existence of an extensive erotic complex containing a number of individual determinants. In this way we gain a deep insight into the actual personality. Subsequent psychoanalysis justified the expectations the association experiment had aroused, thus bearing out the conclusion that the experiment renders the complex hidden behind the neurotic symptoms accessible to investigation. Every neurosis harbours a complex that exerts considerable influence on the experiment and, as countless experiences show, it must have a causal significance.

*

Contributions VII to XI have now been published in Vol. II of *Diagnostische Assoziationsstudien*:

[973] VII. Riklin: "Kasuistische Beiträge zur Kenntnis hysterischer Assoziationsphänomene," pp. 1–30. — The author examines the association phenomena in eight hysterics and comes to the following conclusions: The hysterical type of reaction is dominated by more or less autonomous complexes of great affective power, the development of which seems to be much more pronounced than with normal subjects. One or the other complex dominates the reaction to the exclusion of everything else, so that the experiment is thickly studded with complex-disturbances. Domination by one complex is the hallmark of hysterical psychology; it is probable that all the symptoms can be derived directly from the complex.

[974] VIII. Jung: "Assoziation, Traum und hysterisches Symptom,"¹⁶ pp. 31–66. — This paper undertakes to describe and to determine the various ways in which the erotic complex manifests itself in a case of hysteria. First, analysis of the associations shows how they are constellated by the erotic complex, then follows an analysis of its transformations in a dream-series, and finally the complex is shown to be the root of the neurosis as well. In hysteria the complex possesses an abnormal degree of autonomy and tends to lead an active existence on its own, which progressively diminishes and replaces the power of the ego-complex. In this way a new, pathological personality comes into being, whose inclinations, judgments, and decisions tend only in the direction of the pathological will. The second personality consumes the normal ego-remnant and forces it into the role of a secondary (controlled) complex.

[975] IX. Jung: "Über die Reproduktionsstörungen beim Assoziationsexperiment,"¹⁷ pp. 67–76. — The subject of this paper is the reproduction method discussed above (Jung, "Experimentelle Beobachtungen über das Erinnerungsvermögen"). On the

basis of extensive pathological material it is shown that a faultily reproduced association has a reaction-time that exceeds the mean for the experiment, and exhibits an average of more than twice as many complex-indicators as a correctly reproduced association. From this it is evident that disturbance of reproduction is another indicator for the interference of a complex.

[976] X. Emma Fürst (Schaffhausen): “Statistische Untersuchungen über Wortassoziationen und über familiäre Überstimmung im Reaktionstypus bei Ungebildeten,” pp. 77–112. — Association experiments were made with 24 families totalling 100 subjects; this interim paper presents the results of the evaluation of only 9 of the uneducated families consisting of 37 subjects. Evaluation of the remaining material is not yet complete.

[977] It was found that husbands tend to produce rather more outer associations than their wives, and sons rather more than their sisters. 54% of the subjects, predominantly women, were pronounced predicate-types. The tendency to form value-judgments is greater in age than in youth; with women it begins at 40 and with men at 60. Relatives have a tendency to conform in reaction type to concordance of associations. The most striking and most regular conformity occurs between parents and children of the same sex.

[978] XI. Ludwig Binswanger (Kreuzlingen): “Über das Verhalten des psychogalvanischen Phänomens beim Assoziationsexperiment,” pp. 113–95. [Abstract, by Binswanger, omitted.]

The following works of the Zurich Clinic are concerned with the diagnostic use of the association experiment:

[979] Jung: *Die psychologische Diagnose des Tatbestandes*.¹⁸ Halle, 1906. — General description and interpretation of the experiment. Practical application to a case of theft.

[980] _____. “Le nuove vedute della psicologia criminale. Contributo al metodo della ‘Diagnosi della conoscenza del fatto,’”¹⁹ *Rivista di psicologia applicata*, IV (1908), pp. 285–304. — Practical application to an actual case of theft with several suspects.

[981] Philipp Stein (Budapest): “Tatbestandsdiagnostische Versuche bei Untersuchungsgefangenen,” *Zeitschrift für Psychologie und Physiologie der Sinnesorgane*, 1909. — Investigation of factual evidence presented by guilty, suspected, and innocent persons. The material was collected partly from the Psychiatric Clinic and partly from prisoners held in detention in Zurich, and is of particular interest as stemming from the living reality of criminal practice.

- [982] Jung: *Der Inhalt der Psychose*.²⁰ Freuds Schriften zur angewandten Seelenkunde. No. 3. 1908. — This paper, an academic lecture, discusses the great change which the introduction of Freudian psychology has wrought in our psychological conception of the psychoses. First a simple account is given of the switch from the anatomical to the psychological approach; then follows an outline of the psychological structure of dementia praecox, illustrated by a number of concrete cases. The paper does not purport to be anything more than an introduction to the modern problems of psychological psychiatry. It was published in Russian and Polish in 1909.
- [983] Ladame Geneva: “L’association des idées et son utilisation comme méthode d’examen dans les maladies mentales.” *L’Encéphale, journal mensuel de neurologie et de psychiatrie*. No. 8, 1908). — Extremely objective account of the results of association studies.
- [984] _____. Review of Jung’s *Psychologie der Dementia praecox*. *Archives de psychologie*. IX 1909), 76. — The author summarizes the content of the book in some detail, but refrains from criticism and only adds the following passage at the end: “In conclusion, let us remark how fruitful attempts of this kind ... are. After reading them it is impossible to go to sleep again mentally and to take a calm or desultory view of the innumerable dementia praecox patients who inhabit our asylums. One feels irresistibly compelled to look for something else behind the banal symptoms of psychosis, to discover the individual himself and his normal and abnormal personality.”
- [985] Alphonse Maeder Zurich: I. “Contributions à la psychopathologie de la vie quotidienne.” *Archives de psychologie*. VI. — II. “Nouvelles contributions à la psychopathologie,” *Archives de psychologie*. VII. I Simple analyses of Freudian slips of the tongue, forgetting, *faux pas*. demonstrating the existence of a repressed idea with negative feeling-tone. II The author gives examples of various kinds of forgetting caused by “isolation” and “derivation,” discusses abreaction “décharge émotionnelle” in relation to the concept of the complex, and offers evidence of dissociation in normal persons, including the mechanisms of displacement, “irradiation” and identification. Attention is drawn to “automatismes musicaux” and to the indirect means of expression employed by the unconscious. The author stresses the fruitfulness of this branch of psychopathology.
- [986] _____. “Essai d’interprétation de quelques rêves,” *Archives de psychologie*, VI. —A short introductory account of Freud’s theory of dream interpretation and of psychoanalysis, illustrated by four of the author’s dream analyses. He shows that the same symbols are frequently employed in dreams, legends, and myths in exactly the same way (notably the snake, dog, bird, garden, house, box).
- [987] _____. “Die Symbolik in den Legenden, Märchen, Gebräuchen und Träumen,” *Psychiatrisch-neurologische Wochenschrift*, X. — Thinking in symbols is an inferior

stage of association that equates similarity with identity; it is frequently a process of unconscious activity (hence its role in dreams, hallucinations, delusional ideas, as well as in poetry). Examples are taken from epileptic twilight states. Author discusses the assimilative tendency of the sexual complex in relation to symbol formation. Interpretation of the fish as a sexual symbol provides the clue to numerous customs, folk beliefs (fish on Friday, April fish = April fool, the game on Ash Wednesday), legends and fairytales (Grimm: "The Golden Fish").

[988] _____. *Une voie nouvelle en psychologie*. Coenobium Lugano-Milano, 1909. — Informative essay on Freudian psychology (excluding psychopathology). By uncovering unconscious motivations, psychoanalysis provides a coherent view of the way a person thinks and acts.

[989] Disturbances of unconscious activity are discussed with the help of the author's own analyses. These disturbances should be regarded as expressions of the unconscious, as revelations of unadmitted tendencies. The gradual transition to the pathological is stressed throughout. Dreams are intimately connected with the individual's actual conflicts; they are solutions offered by the unconscious which are often accepted later on and become realities. Conflicts are due partly to the stresses of civilization.

[990] Section III treats of symbols in dreams, hallucinations, fairytales, and legends, and in ordinary speech. The symbol is a special form of thought association characterized by its impreciseness: vague analogies are taken as identities. This is probably typical of the unconscious: it has something infantile and primitive about it. Symbolisms in popular speech (Rabelais, folklore), in legends, in the language of primitives show affinities with associations under fatigue, in *abaissement du niveau mental*, in symptomatic actions when attention is distracted, in dreams, psychoses, and neuroses.

[991] _____. "A propos des Symboles," *Journal de Psychologie normale et pathologique*, 1909. [Abstract, by Maeder, omitted.]

[992] Hermann Müller (Zurich): "Beiträge zur Kenntnis der Hyperemesis Gravidarum," *Psychiatrische-neurologische Wochenschrift*, X. — On the basis of careful clinical observations on a number of cases of hyperemesis²¹ the author comes to the following conclusions:

1. *Vomitus matutinus gravidarum* is a psychogenic symptom.
2. Hyperemesis is in the majority of cases psychogenic.

[993] Although the author does not put forward any complete analysis, in several of his cases he makes psychological insight possible. Attention is paid throughout to the views of the Freudian school.

- [994] _____. "Ein Fall von induziertem Irresein nebst anschliessenden Erörterungem," *Psychiatrisch-neurologische Wochenschrift*, XI. — A case of religious exaltation in a female religious fanatic induced a psychosis in a female hysteric who lived with her, by reason of the "same aetiological demand." The presentation of the two cases is elegant and lucid, thanks to the application of Freudian analysis.
- [995] Oskar Pfister (Zurich): "Wahnvorstellung und Schülerselbstmord. Auf Grund einer Traumanalyse beleuchtet," *Schweizerische Blätter für Schulgesundheitspflege*, I (1909). — "Psychoanalytische Seelsorge und experimentelle Moralpädagogik," *Protestantische Monatshefte*, I (1909). — "Ein Fall von psychoanalytischer Seelsorge und Seelenheilung," *Evangelische Freiheit. Monatsschrift für die kirchliche Praxis in der gegenwärtigen Kultur*, II–V (1909). [Abstract, by Pfister, covering all three items, omitted.]
- [996] Pototsky (Berlin): "Die Verwertbarkeit des Assoziationsversuches für die Beurteilung der traumatischen Neurosen," *Monatsschrift für Psychiatrie und Neurologie*, XXV, pp. 521ff. — The author applied the association experiment to two patients with neuroses due to an accident. In the first case there was an overwhelming predominance of the compensation complex, in the second a striking absence of the same complex. Prognostic conclusions are drawn from these findings.
- [997] Frank Riklin (Zurich): "Hebung epileptischer Amnesien durch Hypnose," *Journ. f. Psychol, u. Neurol.*, 1:5/6 (1903). — The author's success in clearing up the amnesias of epileptics under hypnosis demonstrates their affinity with hysterical amnesias. Association experiments of clinical, diagnostic interest are also reported.
- [998] _____. "Zur Anwendung der Hypnose bei epileptischen Amnesien," *Journ. f. Psychol, u. Neurol.*, II (1903). — Report of another case with epileptic twilight states and disappearance of amnesia, though it is to be regretted that no analysis is given of their content. During these states the patient lovingly stroked a cat, and sometimes a goat too. It has since been brought to my knowledge that this scene was a fragment of an infantile erotic experience.
- [999] _____. "Zur Psychologie hysterischer Dämmerzustände und des Ganserschen Symptoms," *Psychiatrisch-neurologische Wochenschrift*, No. 22 (1904). — Ganser has described the symptom of "irrelevant talk" in hysterical twilight states. Subsequently, the concept of Ganser's symptom has been taken by various authors (Raecke in particular) now in a broader and now in a narrower sense. Further, it was maintained that the symptom is exclusively associated with the outbreak of twilight states among prisoners in detention. The psychological affinity between the irrelevant talk of hysterics and the mechanism of simulation forced itself upon these authors largely because of this fact. Jung ("Ein Fall von hysterischem Stupor bei einer Untersuchungsgefangenen," *Journ. f. Psychol, u. Neurol.*, 1, 1902) was the first to

place the problem on the footing of Freudian psychology, thus facilitating the correct evaluation and interpretation of Ganser's symptom and the twilight state.^{21a}

[1000] The paper reports four cases of hysterical twilight states with Ganser's symptom. Only one of them was a prisoner in detention, the others not. The psychic situation of the detainee is exceptional: he is driven into a corner, gives false answers, tells lies, and in an extremity of distress falls into a twilight state; and only under these conditions will the symptom of "automatized simulation," of not knowing and not understanding, come markedly to the fore. The general situation at the onset of Ganser's twilight state is that a painful event is immediately repressed and thrust into oblivion because it is incompatible with the other contents of consciousness. The motive of not knowing or of not wanting to know produces the symptom of irrelevant talk. Disturbance of orientation proves to be a wish not to be oriented in regard to the existing situation. In twilight states, not knowing can also be replaced by compensatory wish-fantasies. The pronounced "restriction of consciousness" serves to split off the intolerably painful idea and to allow the emergence of censored, wish-fulfilling situations.

[1001] _____. "Analytische Untersuchungen der Symptome und Assoziationen eines Falles von Hysterie," *Psychiatrisch-neurologische Wochenschrift*, No. 46 (1905). — For the main part the analysis stems from the year 1902–3 and concerns a typical, severe case of conversion hysteria. At that time the Breuer-Freud *Studien über Hysterie* still served as a theoretical and technical model. The therapeutic results must be rated very good; during the 6–7 years since then, the patient's physical symptoms have come back only occasionally. Her personality, however, shows signs of moral deterioration. Nowadays, perhaps, we would no longer have the courage or the desire to analyse a personality of so little value and so poorly developed, and with so few hopes for the future. The results are therefore to be rated all the more highly. An important contributory factor was the transference to the analyst. While the author found that abreaction was not sufficient to account for the therapeutic result, he was handicapped by insufficient knowledge of the nature of the transference.

[1002] At the time of the analysis the author was also not familiar enough with dream interpretation to derive much benefit from it.

[1003] The structure of the symptoms was analysed and a number of psychic traumata were discovered. The patient's early childhood received scant attention; on the other hand the mechanism by which hysterical ailments of the body are produced is amply documented.

[1004] One section of the book is devoted to association experiments. At that time it was of great importance to show that the same mechanisms are at work in the association experiment as those which produce hysterical phenomena, and that the

laws governing the effects of the complex are the same in the experiment as in normal persons, but only emerge with greater clarity.

[1005] Another section is concerned with the association mechanism leading to conversion hysteria and with the theory of abreaction. The author was keenly aware of the gap between theory and fact, which has since been filled by introducing the concepts of transference, libido, and infantile sexuality.

[1006] _____. *Die diagnostische Bedeutung von Assoziationsversuchen bei Hysterischen*. — Lecture delivered at the 35th meeting of the Society for Swiss Psychiatrists in St. Urban, 1904. Abstract in the annual report of the Society and in the *Psychiatrisch-neurologische Wochenschrift*, No. 29 (1904).

[1007] _____. “Über Versetzungsbesserungen,” *Psychiatrisch-neurologische Wochenschrift*, Nos. 16/18 (1905). — The opening of the annexes to the Rheinau Sanatorium (Canton Zurich) affords an opportunity to observe the effect of transferring mentally ill patients from one institution to another. The observations relate to 85 patients of whom the author has previous knowledge at the Burghölzli. In more than half the cases an improvement was noted.

[1008] Adaptation to reality is helped by greater freedom of movement and, above all, by work therapy. Especially in the commonest disease, dementia praecox, this draws the patient out of his introversion and transfers his interest to reality. In order to show how the patients assimilate their new milieu, the author briefly discusses the psychological significance of the most important symptoms of this disease (negativism, blocking, wish-fulfilment in delusional ideas, servant-girl psychoses, fertility symbols, mistaken identity due to complexes, religious delusions as translation of wish fantasies into paranoid ideas; their elaboration, condensation, stereotypization, cathexis of the motor apparatus by complex-automatisms).

[1009] The best results are obtained through the exercise of complexes of ideas and functions that have remained normal. Equally effective are early discharge, replacement whenever possible of bed treatment, which only accentuates introversion and “dreaminess,” by work therapy which draws the patients out of themselves.

[1010] With the aid of two case histories it is shown how the introversion comes about, where the transference of interest to the outside world fails, and how the process of introversion goes much further than simple wish-fulfilment in fantasy would require. In the second case even the attempt at wish-fulfilment in reality was unable to check the introversion; the unconscious produced ideas of self-destruction to which the patient succumbed by committing suicide.

[1011] In about half the cases the transfer had no noticeable influence.

[1012] The effects of the transfer are illustrated by a series of excerpts from case histories analytically interpreted.

[1013] _____. "Beitrag zur Psychologie der kataleptischen Zustände bei Katatonie," *Psychiatrisch-neurologische Wochenschrift*, Nos. 32/33 (1906). — The author succeeded in making contact with a catatonic while in a severe cataleptic state and in discovering something of what was going on in this state. We learn from the anamnesis that this condition set in after a psychosis lasting for four years. The psychosis first manifested itself in the patient's autoerotic self-aggrandizement from the age of 18. He tried to win the hand of a relative's rich daughter, completely ignoring the impossibility of doing so. Despite being rebuffed he continued to press his suit undeterred. Cataleptic symptoms were already present on his admission to the clinic, along with a persistent tendency to break out and get to his cousin.

[1014] The patient's condition can be outlined as follows: underlying the catalepsy is a powerful tendency to sleep, to "be a dead man," as was evident from the patient's own statements. The result of this tendency resembles natural sleep, but actually it is more like hypnotic sleep. It is motivated by the repression of a complex, a wish to forget.

[1015] Although the author succeeded in breaking through this sleep tendency, the breakthrough was not complete, so that, side by side with adequate discharge of affect, for instance weeping over the utter hopelessness of ever reaching the beloved, a peculiar compromise between the discharge of affect and the sleep tendency could be observed in the patient's facial expression and demeanour. The two components were sometimes divided into the two halves of the face: one side weeping, one eye open. Keeping the eyes open meant rapport with the investigator; closing the eyes meant breaking off the rapport and the victory of the tendency to sleep or forget.

[1016] Throughout the investigation the thought perseverated, "I am going to marry Emma C.," or "I love Emma C.," counterbalanced by another thought which maintains the sleep tendency as a protective factor and which voices the cousin's reply, "Don't expect anything of the future."

[1017] The patient readily imagined wish-fulfilling situations in which he believed his beloved was standing before him, went towards her, tried to embrace her, took other persons present (doctor, warder) as substitutes (mistaken identity), but always through the veil of cataleptic sleep.

[1018] Through this veil it is possible to perceive quite adequate and profound discharges of affect.

[1019] Evaluation of the questions and modes of reaction follows the laws of complex-reactions in the association experiment.

[1020] This study suggests that the catatonic phenomena in dementia praecox have in general the significance attributed to them in the present case.

[1021] _____. "Über Gefängnispsychosen," *Psychiatrisch-neurologische Wochenschrift*, XI, Nos. 30/37. —An attempt to explain and classify the clinical pictures of prison psychosis along psychoanalytic lines. Prison is a psychological situation which, despite differences of constitution in the diagnostic sense, releases psychological and pathological reactions that are more or less uniform.

[1022] _____. "Psychologie und Sexualsymbolik der Märchen," *Psychiatrisch-neurologische Wochenschrift*, IX, Nos. 22/24. — Excerpts from the author's major work: *Wunscherfüllung und Symbolik im Märchen*.

_____. *Wunscherfüllung und Symbolik im Märchen*. (Schriften zur angewandten Seelenkunde, edited by Freud, No. 2, 1908.) [Abstract, by Riklin, omitted.]

[1023] Schnyder (Bern): *Définition et nature de l'hystérie*. (Congrès des médecins aliénistes et neurologistes de France et des pays de langue française, XVIIIème Session.) Geneva, 1907. — The doctrinal tenets of a wide-ranging literature are scrutinized in this volume. Among the reviews there is an objective account of the Breuer-Freud method, as well as of the theory of complexes. Schnyder rejects the modern viewpoints. "The ideas of Freud and his partisans are certainly an important contribution to the solution of the problem of hysteria. However, the sage of Vienna might be reproached for having introduced an arbitrary mechanization into the psychological conception of hysteria, and for relying on hypotheses which, however ingenious, are of too subjective a nature to lay claim to incontestable scientific value."

[1024] Schwarzwald (Lausanne): "Beitrag zur Psychopathologie der hysterischen Dämmerzustände und Automatismen," *Journ. f. Psychol., u. Neurol.*, XV (1909). — Investigation of a psychogenic twilight state in which the patient set fire to his house. The material allows glimpses into the psychological mechanism of the deed and of the case itself. The infantile history is unfortunately incomplete, but the author is mistaken in dispensing entirely with infantile development. The patient's childhood is of the greatest importance for the subsequent development of neurosis, at least as great as the situation at the moment, if not greater.

[1025] A refining of his psychoanalytic technique would convince the author of the soundness of this view. The dream of "Tom Thumb" which the patient had the day before the incendiarism is very significant and clearly indicates that the act was determined by infantile reminiscences. This has escaped the attention of the author. Analysis of childhood and the correct evaluation of its results is one of the most difficult parts of the psychoanalytical technique, particularly for the beginner.

[Jung contributed several abstracts to the periodical *Folia neuro-biologica* (Leipzig).²² for which he was an editorial consultant. As these are summaries without critical comment, they are not translated but merely listed here:

REVIEW OF HITSCHMANN: "FREUD'S NEUROSENLEHRE"¹

[1026] Hitschmann's book meets a longfelt need. A book that introduces the beginner to the problems of psychoanalysis in a clear and simple way has long been wanted. Hitschmann has fulfilled this task most satisfactorily. It cannot have been easy to present the manifold discoveries and conclusions of psychoanalysis in systematic order, for, contrary to the prejudices of our opponents, it is not at all a question of a preconceived system that puts no difficulties in the way of further theoretical development, but of extraordinarily complicated material that throws into relief the whole laboriousness of patient empirical research (only, of course, if one works in this field oneself.) The content of the book is very diverse but in no way confusing. The author has confined himself to essentials and, where the problems are still fluid, has been satisfied with hints. He has thus succeeded in painting an excellent picture of the present state of psychoanalysis and its far-reaching problems. It is to be hoped that the book will reach the widest possible public, not least because it will dispel numerous prejudices and false opinions which have arisen among medical men through inadequate knowledge of the literature. We must also hope that it will soon be translated into foreign languages, for which purpose it is better suited than many original researches which are so specialized that they are difficult to understand.

ANNUAL REPORT (1910/11) BY THE PRESIDENT OF THE INTERNATIONAL PSYCHOANALYTIC ASSOCIATION¹

[1027] A year and a half ago at the Congress in Nuremberg it was decided to establish an International Association; the foundation of local branches in Vienna, Berlin, and Zurich followed in quick succession. The Berlin branch, with nine members, was set up in March 1910, with Dr. Abraham² as chairman; Vienna followed in April with twenty-four members, under the chairmanship of Dr. Adler.³ Zurich was established in June with nineteen members, under Dr. Binswanger⁴ as chairman. These branches formed the base of our International Psychoanalytic Association, though with its fifty-two members in three countries it was still a tender shoot. With great pleasure and satisfaction I now can announce that in the past year our Association has led a most vigorous life. In February the seed planted in America sprouted. A local branch was established in New York with twenty-one members under the chairmanship of Dr. Brill.⁵ And at long last South Germany joined in: the Munich branch was established in March with six members under Dr. Seif⁶ as chairman.

[1028] During 1911 the respective memberships grew as follows: Berlin, from 9 to 12; Vienna, from 24 to 38; Zurich, from 19 to 29. Thus the total membership rose from 52 to 106. In other words, we have slightly more than doubled.

[1029] The Zurich group is deeply grateful to the stimulus provided by Freud's scientific theories. It may to some extent lessen our debt of gratitude if we may be allowed to point out that the founders of the branches in Berlin, Munich, and New York have come out of the Zurich school.

[1030] This encouraging proliferation in the outside world is matched by the teeming scientific activity within the sections. I refer to the variety of topics on which lectures were given in the individual groups. Positive contributions to our scientific problems, however, can be expected only when an individual member's rich experience is brought to bear on the solution of the problem adduced. In general, such an ideal condition is difficult to bring about; specifically, groups with comparatively recent local traditions will consider it their foremost goal to instruct and educate their members. At this time psychoanalysis demands of anybody who wants to master it an uncommon amount of industry and scientific concentration, if it is to be more than the free-wheeling exercise of highly individualized talents. The temptation to eschew empirical evidence is very strong in psychoanalytic work, especially since scientific *pseudo-exactitude*, like all cultural absurdities, collapses before the gaze of the analysand into its own nothingness. Yet, this does not do away with the need for

systematic planning of scientific research and exposition, which must be well conceived and immediately convincing. We who are favoured with taking possession of these newly discovered territories are obliged to use self-discipline so as to prevent these goods from being jeopardized by an unbridled imagination. Let us never forget that everything we conceive and create is well conceived and well created only when it is addressed to mankind in a humanly intelligible language. What fate expects of us is that we faithfully husband the enormous store of knowledge provided by Freud's discoveries and pass it on to our fellow men, rather than pervert it for the gratification of our own ambitions. This task requires from each of us not only a high degree of self-criticism, but also a thorough psychoanalytic training. We know well that this training is hard to come by in isolation; it is easier to obtain it when many different heads work together. This task of teaching and training is one of the main purposes of the branches of our Association, and I should like to recommend it to the local chairmen with special emphasis. Next to the results of new research, discussions of elementary questions should be on the agenda of local meetings; they would enable younger members to acquire knowledge of fundamental ideas and principles with which a thorough familiarity is the *sine qua non* of the scientific method. Such basic discussions would make it possible to dispose of many theoretical and practical misconceptions. And it seems to me of great importance to expose deviations of opinion to immediate and thorough discussion in order to forestall any squandering of our strength on pointless side-issues. This possibility, as the events in Vienna⁷ have shown, lies not so far afield, inasmuch as the present unbridled ways of psychoanalytic investigation and the multitude of problems that are touched upon encourage changes, as revolutionary as they are unjustified, in the principles of neurosis theory that Freud discovered and elaborated in decades of hard work. I believe, vis-à-vis such temptations, that we must never forget that our Association also has the important purpose of discrediting "wild" psychoanalysis and not admitting it to its own ranks. We need not fear that dogmatism—long desired by our opponents—would surely invade psychoanalysis; but it rather means that we are holding tightly to the principles we have gained and to which we will adhere until they have been either entirely confirmed or else recognized as wholly false.

[1031] After these remarks and wishes concerning the cultivation of our science in the local branches, I must also call your attention to the publishing activities in the psychoanalytic field. The past year has seen the *Zentralblatt für Psychoanalyse*⁸ added to the *Jahrbuch*; under its alert editorship the new journal has already published a great deal of material and by its variety rendered a good account of the variety of psychoanalysis. Next year a further organ will be added,⁹ of a more general rather than strictly medical character.

[1032] This year I have witnessed with my own eyes the tremendous impression that the efforts on behalf of our cause have created in the world. Knowledge and appreciation of psychoanalysis are more widespread than is generally assumed.

[1033] This past year has brought us in Zurich a loss, a loss of special poignancy for the hopes for our scientific future. It is the death of our friend Honegger,¹⁰ who had recommended himself to the membership by his ingenious paper read at Nuremberg.

TWO LETTERS ON PSYCHOANALYSIS¹

10 January 1912

[1034] In the communication from Dr. Kesselring and Dr. B. of the Keplerbund, which appeared in this column, exception was taken to the following remark of the reporter: “Dr. Kesselring, as he himself observed, spoke as an opponent of Freud’s psychoanalytic method and at the request of the Keplerbund. This Society is opposed to a tendentious materialistic pursuit of the natural sciences and wishes to combat the erroneous view that scientific knowledge stands in the way of religious belief. Hence the impression which the speaker intended to make upon his audience is perfectly understandable.”

[1035] In saying this the reporter did not “discredit” Dr. Kesselring’s willingness to speak on Freud in the Keplerbund, nor did he discredit the general activity of that Society—he merely stated something that was self-evident. The Keplerbund has the following article in its programme, which it claims is based on a “scientifically and ethically unassailable foundation”: “The Keplerbund holds the conviction that the truth contains within itself the harmony of scientific facts with philosophical knowledge and with religious experience.” Further: “The Keplerbund differs quite consciously from the materialistic dogma of monism and combats the atheistic propaganda resulting therefrom, which wrongly seeks support in the findings of natural science.”

[1036] According to this programme, therefore, the Keplerbund is not merely a champion of enlightenment and popular education, but also a militant organization. Since Freud’s teachings likewise stand in sharpest contrast to the “harmony” sought for by the Keplerbund, every thinking person will know that the society must, on its own admission, fight against them. When an organization arranges a lecture, it usually makes sure beforehand of the point of view of the lecturer, no matter whether its interest in the theme is religious, political, artistic, or scientific. Anyone who knows that Dr. Kesselring was a pupil of Freud’s must also know—so at least one must assume—that he is Freud’s opponent in theory and in practice. Equally, a reporter engaged by the Keplerbund knows that he cannot defend Freud’s “pan-sexualism” within its precincts. The reporter, who incidentally is neither a Freudian nor against the Keplerbund, did not credulously rely on the opinions of others, but to the best of his ability oriented himself beforehand on the theme of the lecture, the principles of the Keplerbund, and the views of Dr. Kesselring.

[1037] In this same connection a correspondent wrote: "To the amazement of professional people Dr. Kesselring's lecture 'On Psychoanalysis' brought before the public at the Schwurgerichtssaal a recent line of medical research which, among other things, has to include within the scope of its analytical work the most intimate and repulsive of all human fantasies. Disputes over the results of this research are taking a violent form in professional circles, and opinions are very much divided. But however violent the scientific discussion may be, opponents and friends of psychoanalysis are alike agreed that such things, even if only for the sake of good taste, should not be paraded before the public at the Schwurgerichtssaal, quite apart from the fact that even the best educated public can exercise no competent judgment in these matters. One could, with as much right, hold gynaecological examinations at the Schwurgerichtssaal in order to arouse public feeling against some of the findings of medical research."

[1038] For the rest, the lecture, whose lack of objectivity must have struck even the layman, contained so many distortions that it seemed designed to spread confusion and error. Those who wish to find out what psychoanalysis is really about are recommended to read Freud's *Über Psychoanalyse*² (publ. Deuticke, Vienna and Leipzig), in which he gives an account of his views and methods in more or less popular language. Reference should also be made to the invaluable work *Die Psychoanalyse Freuds*³ (Deuticke) by Eugen Bleuler, professor of psychiatry at Zurich, who discusses in an objective and critical way the pros and cons of psychoanalysis. The authority and continental reputation of this excellent scholar should guarantee the educated public a more competent view of psychoanalysis than the statements of Dr. Kesselring.

DR. J.

17 January 1912

[1039] In connection with the article on "Psychoanalysis" that was published in your columns last Saturday, I would like to remark that the concept of sexuality used by Freud and me has a far wider range of meaning than it has in common usage. As I have often pointed out, we understand by "sexuality" all those instinctual forces which extend beyond the domain of the instinct of self-preservation. The scientific justification for this conception cannot be discussed here. It can be read about in Freud's and my writings. Confusion between the common conception and our biological conception of sexuality naturally leads to the greatest misunderstandings.

[1040] I further allow myself to remark that it is not permissible to lay at our door all the immature researches that have been undertaken by less qualified persons. We can accept responsibility only for what we ourselves have written, and not for the manifold sins of other writers. One could just as well hold Christianity responsible

for the abominations of the Inquisition, if one wished to adopt so summary a procedure. Naturally, I am not thinking of the invaluable researches of Dr. Riklin, with which I am in full agreement, but of the book by Michelsen,⁴ mentioned by my critic F. M.,⁵ and a number of other writings whose standpoints and method of exposition I must repudiate.

DR.JUNG

ON THE PSYCHOANALYTIC TREATMENT OF NERVOUS DISORDERS¹

[1041] Psychoanalysis differs from other psychotherapeutic methods in that, by preference, it takes as its starting point those products of the human psyche which originate outside the selective effect of attention—parapraxes, the seemingly pointless fantasies of daydreaming, nocturnal dreams. The founder of the method, Professor Freud of Vienna, has succeeded in demonstrating from this material the existence of a principle which governs psychic events, the principle of *determination*. These inferior products, accordingly, are not fortuitous, but clearly and demonstrably are causally conditioned, or in psychological terms determined. They are formed under the influence of feeling-toned, unconscious ideas.

[1042] The application of the method to the pathological formations of psychoneurotics has shown that these are built up in a similar way, only they are much more complicated. The first formulation of the newly won insights was the trauma theory, as propounded by Breuer and Freud in their *Studies on Hysteria*, published in 1895.

[1043] Further investigations showed, however, that the trauma is of less pathological significance than the *conflict*, or rather, that most experiences acquire traumatic force only when they release a conflict within the patient. These conflicts are in the overwhelming majority of cases between sexual wishes (in the widest sense) and opposing tendencies of a moral and aesthetic nature. The result of such conflicts, which affect the emotional life, is a series of pathological processes, mechanisms altogether comparable to the defensive measures which the body puts up against a noxious agent.

[1044] To trace these mechanisms is now the task of the therapy, the ultimate aim of which is to free the psyche from the conflict.

[1045] In the case of a 35-year-old female hysteric, married, mother of several children, who since her 20th year had exhibited a number of hysterical physical symptoms, psychoanalysis was carried out after numerous other treatments had failed. Three of her symptoms, which all affected the respiratory activity, could be traced back to a trauma at the age of puberty, an attempted rape, when the full impact of the man's body had compressed the thorax. But the ultimate determinant was to be found in the experiences of earliest childhood, when the patient had listened with sexual excitement to the nightly intercourse of her parents. Thus the symptom which seemed like a sudden involuntary expiration with simultaneous closure of the glottis was a repetition of the following scene: her mother once came to her bed, whereupon she

started violently and wanted to let out a scream, which she was just able to suppress. These two opposed innervations persisted in the form of the aforesaid symptom.

[1046] Now when, as a result of unfavourable experiences, the individual does not obtain sufficient sexual gratification in later life, a process occurs which Freud calls regression: as a substitute for the failure of gratification, the patient reverts to an earlier, infantile one.

[1047] This infantile gratification, however, is not re-experienced in its original form, but only in the form of its somatic, physiological concomitant. There is a *conversion* of sexual excitation into somatic-motor excitation.

[1048] So with this patient the respiratory disturbance induced by the two opposed innervations became fixated not because of the fright she had received, but because of the sexual excitement that had accompanied her listening.

[1049] The onset of the disorder was directly connected with her marriage, which had brought the patient disappointments, so that in intercourse she remained frigid. The libido that was nevertheless present consequently chose the way of regression and led to the reactivation of those past and forgotten experiences of gratification, or rather to their physiological concomitants.

[1050] The result of the treatment was that all symptoms disappeared but for a few traces.

[The discussion that followed did not deal specifically with Jung's case. The speakers, including Paul-Charles Dubois, of Bern,² recounted cases of their own that had been cured by nonpsychoanalytic means and made various hostile remarks. Jung concluded:]

[1051] It is regrettable that the discussion failed to deal more specifically with the analysis presented here. The method of psychoanalytic research and treatment cannot be rejected as a whole unless on examination it turns out to be defective, but this was not done here. Psychoanalysis represents a radical theory which should be used together with other methods.

[1052] The view that it should not be used because its usefulness has not been proved or theoretically established cannot be supported by the facts [of the case], and it would disregard the principle of scientific research that practical experimentation is to be given preference over theoretical considerations.

[1053] Failures, naturally, do occur, but just as in other fields they do not permit us to draw conclusions of a general validity.

[1054] The discussion of sexual matters is admittedly not easy and not to everyone's taste; tactfully employed, however, it is an essential ingredient of any psychotherapy. — Dreams are often inexactly reported or added to; these additions are, however, as Freud has shown, not fortuitous coincidences, but governed by the same unconscious

ideas that informed the dream itself. That childhood impressions persist throughout one's life, even if they seemingly are insignificant, is a certainty. The explanation for this is that such impressions have been repressed because of a certain significant conjunction of ideas, and for this very reason could survive in the unconscious until they were uncovered by analysis.

A COMMENT ON TAUSK'S CRITICISM OF NELKEN¹

[1055] In the first issue of this periodical there was a review by Tausk of Nelken's "Analytische Beobachtungen über Phantasien eines Schizophrenen."² In this review I came upon the following passage:

In the first catatonic attack the patient produced the fantasy that mice and rats were gnawing at his genitals. Nelken derives the symbolic significance of these animals from a suggestion of Jung's, who sees them as symbolizing nocturnal fear. There is no doubt that this interpretation is correct, but it comes from a later elaboration of this symbol and bars the way to deeper insight. Analysis of dreams and neuroses has taught me beyond question—and I find my view supported by other psychoanalysts—that mice and rats are cloacal animals and that they represent, in symbolic form, the defecation complex (anal complex).

[1056] I would like to defend Nelken's view against Tausk's. I do not doubt in the least that Tausk's view is also right. We have known this for a long time, and it has been completely confirmed once more by Freud's rat-man.³ Further, we know very well that catatonic introversion and regression reactivate all the infantile impulses, as is evident from numerous observations in Nelken's analysis. So there is no question of this aspect of the case having escaped us; it merely seemed unimportant because by now it is self-evident. It is no longer of vital importance to know that the anal complex can act as a substitute for normal modes of transference or adaptation, since we know already that the pathological regression of libido reactivates every variety of infantile sexualism and produces infantile fantasies of every conceivable kind. Anyone who still thinks that a definite group of fantasies, or a "complex" has been singled out just hasn't seen enough cases. We therefore consider it irrelevant that the castration is performed by cloacal animals. Incidentally, mice are not "cloacal animals" but animals that live in holes, and this is a more comprehensive concept than "cloacal animals."

[1057] The only thing we learn from this interpretation is that an infantile complex or infantile interest takes the place of the normal interest. It may be of some value for the specialist to know that in this particular case it was the anal fantasy that contributed a bit of symbolism for the purpose of expressing the introversion and regression of libido. But this interpretation does not supply a generally applicable principle of explanation when we come to the far more important task of discovering

the real functional significance of the castration motif. We cannot content ourselves with a simple reduction to infantile mechanisms and leave it at that.

[1058] I was once given a very impressive example of this kind of interpretation. In a discussion on the historical fish-symbol, one of those present remarked that the fish vanishing in the sea was simply the father's penis vanishing in his wife's vagina. This kind of interpretation, which I consider sterile, is what I call sexual concretism. It seems to me that psychoanalysts are confronted with the much greater and more important task of understanding what these analogies are trying to say. What did men of many different races and epochs mean by the symbol of the fish? Why—in the present case too, for that matter—were these infantile channels of interest reactivated? What does this fetching up of infantile material signify? For this obviously is the problem. The statement: "Infantile reminiscences are coming to the surface again" is vapid and self-evident. It also leads us away from the real meaning. In Nelken's case the problem is not the derivation of part of the rat-symbol from the anal complex, but the castration motif to which the fantasy obviously belongs. The rats and mice are the instrument of the castration. But there are many other kinds of castrating instrument which are by no means anally determined. Tausk's reduction of the rats is merely of value to the specialist and has no real significance as regards the problem of sacrifice, which is at issue here.

[1059] The Zurich school naturally recognizes that the material is reducible to simpler infantile patterns, but it is not content to let it go at that. It takes these patterns for what they are, that is, images through which the unconscious mind is expressing itself. Thus, with reference to the fish-symbol, we would argue as follows : We do not deny the Viennese school the possibility that the fish-symbol can ultimately be reduced to parental intercourse. We are ready to assume this provided there are fairly cogent reasons for doing so. But, because we are not satisfied with this relatively unimportant reduction, we ask ourselves what the evocation of parental intercourse or something similar means to the patient. We thus carry the assumption a stage further, because with the reduction to the infantile pattern we have not gained an understanding of the real significance of the fact that the reminiscence was regressively reactivated. Were we to remain satisfied with the reduction, we would come back again and again to the long-since-accepted truth that the infantile lies at the root of the mental world, and that adult mental life is built upon the foundations of the infantile psyche.

[1060] Even in the backwaters of the psychoanalytic school one should have got beyond marvelling over the fact that, for instance, the artist makes use of images relating to the incest complex. Naturally every wish has these infantile patterns which it makes use of in every conceivable variation in order to express itself. But if the pattern, the infantile element, were still absolutely operative (i.e., not just

regressively reactivated), all mental products would turn out to be unbelievably trivial and deadly monotonous. It would always be the same old infantile story that formed the essential core of all mental products. Fortunately, the infantile motifs are not the essential; that is to say, for the most part they are regressively reactivated, and are fittingly employed for the purpose of expressing currents and trends in the actual present—and most clearly of all when the things to be expressed are as far-off and intangible as the most distant childhood. Nor should it be forgotten that there is also a future. The reduction to infantile material makes the inessential in art—the limited human expression—the essence of art, which consists precisely in striving for the greatest variety of form and the greatest freedom from the limitations of the conventional and the given.

[1061] Herbert Silberer⁴ once made the very good observation that there is a mythological stage of cognition which *apprehends symbolically*. This saying holds good for the employment of infantile reminiscences: they aid cognition or apprehension and are expressive symbols. No doubt the infantile reminiscence or tendency is still partly operative and thus has an extraordinarily disturbing and obstructive effect in actual life. That is also the reason why it is so easy to find. But we would be wrong to regard it as a *source of energy* on that account; it is much more a limitation and an obstacle. But because of its undeniable existence it is at the same time a necessary means of expression by analogy, for the furthest reaches of fantasy cannot offer any other material for analogical purposes. Accordingly, even if we do approach the primitive images analytically, we are not content with reduction and with establishing their self-evident existence, but, by comparing them with similar material, we try rather to reconstruct the actual problem that led to the employment of these primitive patterns and seeks expression through them. In this sense we take incest primarily as a symbol, as a means of expression, as Adler too has suggested.

[1062] Hence I cannot agree with Tausk when he says that comparison with analogous material “bars the way to deeper insight.” We do not regard the discovery of the anal fantasy as an insight that could be compared in importance with an understanding of the castration motif. I must therefore defend Nelken’s attempt to establish general connections in a wider context. We can hardly expect proof of the self-evident existence of infantile fantasies to furnish any insight into the general problem of sacrifice, which makes use of the castration motif among others. That Nelken has this question in mind is clear from his footnote, in which he refers to the snake and scorpion as historical castration animals.

[1063] I have taken the liberty of dwelling at some length on Tausk’s comment because it seemed to offer a favourable opportunity to sketch out our different approach to these matters. We do not by any means deny the possibility of Tausk’s reduction, as should be obvious. But in this and all similar reductions we find nothing that seems

to us to offer a satisfactory explanation. We believe, on the contrary, that a satisfactory explanation must make clear the teleological significance of the castration motif. In psychology, as is generally known, you cannot get very far with purely causal explanations, since a very large number of psychic phenomena can be satisfactorily explained only in teleological terms. This does nothing to alter or to detract from the exceedingly valuable discoveries of the Freudian school. We merely add the factor of teleological observation to what already exists. I have devoted a special study to this question, which will shortly appear in the *Jahrbuch*.⁵

[1064] Our attempts to develop and broaden the previous insights have given rise to absurd talk of a schism. Anything of that sort can only be the invention of people who take their working hypotheses as articles of faith. This rather childish standpoint is one which I do not share. My scientific views change with my experience and insight, as has always been the case in science generally. It would be a matter for suspicion if this were not so.

ANSWERS TO QUESTIONS ON FREUD¹

On 24 July 1953. the representative of the *New York Times* in Geneva, Michael L. Hoffman, sent Jung the following questionnaire in connection with a projected article on Freud:

1. What part of Freud's work do you accept?

2. What was the role of Freud's work and views in the development of your own analytical psychology?

3. In your opinion does Freudian sexuality play any part in the aetiology of neuroses?

4. Would you care to make an estimate of Freud's contribution to our knowledge of the psyche?

5. Would you care to comment on the value of Freud's procedure as a therapeutic procedure?

[1065] As it is impossible to deal with a critique of Freud's work in a short article I have to restrict myself to concise answers.

[1066] 1. I accept the facts Freud has discovered, but accept his theory only partially.

[1067] 2. The facts of repression, substitution, symbolization, and systematic amnesia described by Freud coincided with the results of my association experiments (1902–4). Later on (1906) I discovered similar phenomena in schizophrenia. I accepted in those years all of Freud's views, but I could not make up my mind to accept the sexual theory of neurosis and still less of psychosis, no matter how much I tried. I came to the conclusion (1910) that Freud's one-sided emphasis on sex must be a subjective prejudice.

[1068] 3. It is obvious that the sexual instinct plays a considerable role everywhere in life, and thus also in neurosis, and it is equally obvious that the power-drive, the many forms of fear, and the individual necessities are of equal importance. I object only to the uniqueness of sexuality as suggested by Freud.

[1069] 4. Freud's contribution to our knowledge of the psyche is without doubt of the greatest importance. It yields an insight into the dark recesses of the human mind and character which can be compared only to Nietzsche's *Genealogy of Morals*. In this respect Freud was one of the great cultural critics of the nineteenth century. His specific resentment explains the one-sidedness of his explanatory principle.

[1070] One could not say that Freud is the discoverer of the unconscious—C. G. Carus and Eduard von Hartmann were before him and Pierre Janet was his contemporary—

but he certainly showed a way to the unconscious and a definite possibility of investigating its contents. In this respect his book on dream interpretation proved to be most helpful, although from a scientific standpoint it is most objectionable.

[1071] 5. The question of psychological therapy is exceedingly complex. We know for certain that just any method or any procedure or any theory, seriously believed, conscientiously applied and supported by a humanly congenial understanding, can have a most remarkable therapeutic effect. Therapeutic efficacy is by no means the prerogative of any particular system; what counts is the character and the attitude of the therapist. For this reason I tell my pupils: you must know the best you can about the psychology of neurotic individuals as well as of yourself. If it is the best, you are likely to believe it, and then you can be serious enough to apply what you know with devotion and responsibility. If it is the best *you* know, then you will always entertain a reasonable doubt whether somebody else might not know better than yourself, and out of sheer compassion with your patient you will make sure that you don't lead him astray. Therefore you will never forget to inquire how far he agrees or disagrees with you. When he disagrees you are stuck, and if this fact is overlooked both doctor and patient are fooled.

[1072] Theory is important in the first place for science. In practice you can apply as many theories as there are individuals. If you are honest you will preach your individual gospel, even if you don't know it. If you are right, it will be good enough. If you are wrong, even the best theory will be equally wrong. Nothing is worse than the right means in the hands of the wrong man. Never forget that the analysis of a patient analyses yourself, as you are just as much in it as he is.

[1073] I am afraid psychotherapy is a very responsible business and anything but an impersonal application of a convenient medical method. There was a time when the surgeon did not even think of washing his hands before an operation, and the time is still with us when doctors believe they are not personally concerned when they apply psychotherapeutic methods.

[1074] For this reason I object to any kind of prejudice in the therapeutical approach. In Freud's case I disagree with his materialism, his credulity (trauma theory), his fanciful assumptions (totem and taboo theory), and his asocial, merely biological point of view (theory of neurosis).

[1075] This is a mere outline of critical viewpoints. I myself regard such statements as futile, since it is much more important to put forward facts that demand an altogether different conception of the psyche, i.e., new facts unknown to Freud and his school.

[1076] It has never been my purpose to criticize Freud, to whom I owe so much. I have been far more interested in the continuation of the road he tried to build, namely the further investigation of the unconscious so sadly neglected by his own school.

VII

ON SYMBOLISM

(related to Volume 5 of the Collected Works)

[Though not recorded by Jung himself, these brief abstracts are included as evidence of Jung's preparatory work for *Wandlungen und Symbole der Libido* (1911–12), revised as *Symbols of Transformation* (1952). *The Freud/Jung Letters* contains references to preliminary drafts, e.g., the unrecovered "Herisau lecture," in 193J, par. 3, which Freud subjected to detailed criticism in 199aF.]

THE CONCEPT OF AMBIVALENCE¹

[1077] *Discussion.*² C. G. Jung: The concept of ambivalence is probably a valuable addition to our terminology. In one and the same thing the opposite may be contained. *Altus* = high and deep. Pleasure may derive from pain. This implies not a sequence of one after the other, but a simultaneous one-in-the-other: a uniform given. He [Jung] objects to the statement “Ambivalence is the driving force.” Ambivalence probably is not the driving force, but rather a formal aspect as we find it everywhere. Freud has adduced many examples from the history of language. Modern words too show ambivalence, e.g., *sacré*,³ *luge* (Irish) = contract;⁴ *bad* (English) = *bat* = *bass* (Middle High German) = good. Through the migration of language the meaning of a word is transformed into its historical opposite. Dreams make use of similarities as well as of opposites. Among the possibilities of similarity, contrast is closest at hand. He, Jung, had this dream: *He is a small man with a beard, wears no glasses and is no longer young.* Hence, everything the opposite. If we want to demonstrate our psychoanalytic view, we too, just like the anatomists, command an unambiguous kind of material that we find in the monuments of antiquity and in the field of mythology. For example, the fertility god is at the same time the destroyer (Indra). The sun means fertility and destruction. Therefore we have the lion as a zodiac sign standing for the intense heat of the sun. Ambivalence is evident in the mythological successions. Odin becomes the wild hunter who molests lonely girls on the highways. Freia has turned into a she-devil. Venus, as the philologists teach us, acquired a good aspect and turned into St. Verena (St. Verena, the patron saint of Baden, Ct. Aargau; watering places, as we know from history, were consecrated and subject to Venus). St. Verena, Venus, however, also lends her name to dangerous mountains (Verenelisgärtli near the Glärnisch; St. Verenakehle is the name of the great avalanche chute on the Schafburg in the Säntis mountains). *Devas* (Sanskrit, = angel) becomes the devil in Persian. The snake on the pole corresponds to the ambivalence of the concept of Christ.

[1078] The representation of libido oscillates between the symbols of the lion and the snake, the principle of dry and wet: both are opposite sexual or phallic symbols. Jung saw a stele of Priapus in Verona. The god smilingly holds a basket full of phalli on his arm and points with the other hand to a snake which bites off his erect penis.⁵

[1079] Nice examples of ambivalence are shown by the language of erotic jokes, such as occur in the *Golden Ass* of Apuleius;⁶ also in the language of mysticism; Mechtild of Magdeburg says: “By Christ’s love I have been wounded unto death.” Through the

killing of the bull (in the Mithras mythologies) creation is brought about. “The bull is the father of the snake and the snake is the father of the bull.”⁷ Our Christian religious ideas are likewise based on this principle. Through Christ’s death, man is redeemed for life eternal. We encounter the same idea in the cult of Mithras, which was of great importance in antiquity and helped spread the concepts of Christianity.

* * *

[1080] *Discussion.*⁸ C. G. Jung: The expression “taken off my chest”⁹ in reference to the discussion of the tormenting complex is very apt and characteristic of analytic therapy. An officer, whenever his complex was about to get the better of him, commanded: “Attention— halt! Six paces to the rear—march!” and every time felt very much relieved by this objectivation of his disease.

* * *

[1081] *Discussion.*¹⁰ As a contribution from child psychology to the significance of sacrifice, C. G. Jung tells about the “Tantalus Club” which was founded by some youngsters for the celebration of sexual mysteries. Their emblem depicted a man who hung from a gallows by a rope tied to his penis and his nose. The sacrificed and tormented were the youngsters themselves, just like Tantalus whose torment consists in constantly being denied satisfaction of his most ardent desires.

CONTRIBUTIONS TO SYMBOLISM¹

[1082] Starting from the contrast that exists between hysterical fantasies and those of dementia praecox, the lecturer points out that in order to understand the latter, historical parallels must be adduced, because in dementia praecox the patient suffers from the reminiscences of mankind. In contrast to hysteria, his language uses ancient images of universal validity, even though at first glance they seem incomprehensible to us.

[1083] The case of a 34-year-old female neurotic serves to illustrate how a recent fantasy can be documented and elucidated by historical material. The patient's fantasy deals with a man she loves unrequitedly who is suspended by the genitals, a fantasy which was also found in a 9-year-old boy as a symbolic expression of his unfulfilled libido ("Hanging and fearing, suspended in pain").² This fantasy, when taken together with corresponding ethnological traditions and mythological parallels of the sacrifice of the god of spring by hanging or flaying, signifies a sacrifice of sexuality which one hangs on to and cannot get rid of and which in ancient cults was offered to the Great Mother as a sacrifice of the phallus.³

VIII

TWO ESSAYS ON ANALYTICAL PSYCHOLOGY

(related to Volume 7 of the Collected Works)

ADAPTATION, INDIVIDUATION, COLLECTIVITY¹

1. Adaptation

[1084] A. *Psychological adaptation* consists of two processes:

1. Adaptation to outer conditions.
2. Adaptation to inner conditions.

[1085] By outer conditions are meant not only the conditions of the surrounding world, but also my conscious judgments, which I have formed of objective things.

[1086] By inner conditions are meant those facts or data which force themselves upon my inner perception from the unconscious, independently of my conscious judgment and sometimes even in opposition to it. Adaptation to inner conditions would thus be adaptation to the unconscious.

[1087] B. In *neurosis* the adaptation process is disturbed, or rather we might say that the neurosis is itself a disturbed or diminished process of adaptation that takes two basic forms:

1. Disturbance of adaptation to outer conditions.
2. Disturbance of adaptation to inner conditions.

[1088] In the first case we must again distinguish two different and fundamental situations:

1. Adaptation to outer conditions is disturbed because the subject tries to adapt entirely and exclusively to the outside, while entirely neglecting the inside, thereby upsetting the balance of the act of adaptation.

2. The disturbance arises from a preferential adaptation to the inside.

[1089] Equally, adaptation to inner conditions can be disturbed in two ways:

1. By exclusive adaptation to the outside.
2. By neglect of the outside in favour of adaptation to the inside.

[1090] C. *The Energetics of Adaptation*: These considerations lead to the energetics of the adaptation process. When the libido invested in a particular function cannot be equilibrated by the exercise of the function, it accumulates until it attains a value which exceeds that of the neighbouring functional system. Then a process of equilibration begins, because a potential is present. The energy flows over, as it were, into another system. When, therefore, adaptation to the inside is not achieved, the libido intended for that purpose accumulates until it begins to flow out of the system

of inner adaptation into the system of outer adaptation, with the result that characteristics belonging to inner adaptation are carried over into outer—that is to say, fantasies intervene in the relation to the real world. Conversely, when the system of outer adaptation overflows into the system of inner adaptation, characteristics belonging to the former are carried over into the latter, namely, qualities belonging to the reality-function.

[1091] D. *Adaptation in Analysis*: Adaptation in analysis is a special question. During the analysis, experience shows that, barring quite exceptional circumstances, the analysis is the main thing. There is no categorical imperative, “The analysis *must* be the main thing”; it is simply that, judging by the average run of experience, the analysis *is* the main thing. Hence the main achievement is in the first place adaptation to the analysis, which for one patient is represented by the person of the analyst, and for another by the “analytical idea.” The purpose in either case is to secure trust: the one who starts off with an unconscious mistrust of his fellow seeks above everything to make sure of the personality of the analyst; the other, whose main desire is to be instructed about the reliability of methods of thinking, seeks above everything to understand the basic ideas.

[1092] As the analysis proceeds, the former must naturally catch up in understanding the idea, the latter in learning to trust the analyst’s personality.

When adaptation has been carried thus far, the analysis is generally held to have come to an end for all practical purposes, in so far as it is assumed that this personal balance is the essential aim and demand. There is, on the fact of it, nothing to be said against this view.

[1094] Experience shows, however, that in certain and not too uncommon cases a demand is raised by the unconscious, which expresses itself to begin with in the extraordinary intensity of the transference, and in the influence thus exerted on the patient’s lifeline. This heightened transference seems, at first, to contain the demand for a particularly intensive adaptation to the analyst, and for the time being it should be accepted as such, though it is at bottom an over-compensation for a resistance to the analyst that is felt to be irrational. This resistance arises from the demand for individuation, which is *against* all adaptation to others. But since the breaking of the patient’s previous personal conformity would mean the destruction of an aesthetic and moral ideal, the first step in individuation is a tragic *guilt*. The accumulation of guilt demands *expiation*. This expiation cannot be offered to the analyst, for that would only restore the patient’s personal conformity. The guilt and its expiation call for a *new collective function*: just as before the object of faith and love, namely the image of the analyst, was a *representative* of humanity, so now humanity itself takes the place of the analyst and to it is offered the expiation for the guilt of individuation.

[1095] Individuation cuts one off from personal conformity and hence from collectivity. That is the guilt which the individuant leaves behind him for the world, that is the guilt he must endeavour to redeem. He must offer a ransom in place of himself, that is, he must bring forth values which are an equivalent substitute for his absence in the collective personal sphere. Without this production of values, final individuation is immoral and—more than that—suicidal. The man who cannot create values should sacrifice himself consciously to the spirit of collective conformity. In so doing, he is free to choose the collectivity to which he will sacrifice himself. Only to the extent that a man creates objective values can he and may he individuate. Every further step in individuation creates new guilt and necessitates new expiation. Hence individuation is possible only so long as substitute values are produced. Individuation is exclusive adaptation to inner reality and hence an allegedly “mystical” process. The expiation is adaptation to the outer world. It has to be offered to the outer world, with the petition that the outer world accept it.

[1096] The individuant has no *a priori* claim to any kind of esteem. He has to be content with whatever esteem flows to him from outside by virtue of the values he creates. Not only has society a right, it also has a duty to condemn the individuant if he fails to create equivalent values, for he is a deserter.

[1097] When, therefore, the demand for individuation appears in analysis under the guise of an exceptionally strong transference, it means farewell to personal conformity with the collective, and stepping over into solitude, into the cloister of the inner self. Only the shadow of the personality remains in the outer world. Hence the contempt and hate that come from society. But inner adaptation leads to the conquest of inner realities, from which values are won for the reparation of the collective.

[1098] Individuation remains a pose so long as no positive values are created. Whoever is not creative enough must re-establish collective conformity with a group of his own choice, otherwise he remains an empty waster and windbag. Whoever creates *unacknowledged* values belongs to the contemned, and he has himself to blame for this, because society has a right to expect *realizable* values. For the existing society is always of absolute importance as the point of transition through which all world development passes, and it demands the highest collaborative achievement from every individual.

2. Individuation and Collectivity

[1099] Individuation and collectivity are a pair of opposites, two divergent destinies.² They are related to one another by guilt. The individual is obliged by the collective demands to purchase his individuation at the cost of an equivalent work for the benefit of society. So far as this is possible, individuation is possible. Anyone who cannot do this must submit directly to the collective demands, to the demands of

society, or rather, he will be caught by them automatically. What society demands is *imitation* or conscious identification, a treading of accepted, authorized paths. Only by accomplishing an equivalent is one exempted from this. There are *very many people who at first* are altogether incapable of accomplishing this equivalent. They are therefore bound to the well-trodden path. If they are pushed off it, they are seized by helpless anxiety, from which only another of the prescribed paths can deliver them. Such people can achieve self-reliance only after imitating for a very long time one of the models they have chosen. A person who by reason of special capacities is entitled to individuate must accept the contempt of society until such time as he has accomplished his equivalent. Only a few are capable of individuating, because individuation rules out any renunciation of collective conformity until an equivalent has been accomplished whose objective value is acknowledged. Human relationship establishes itself automatically on the basis of an acknowledged equivalent, because the libido of society goes directly towards it. Without the equivalent, all attempts at conformity are foredoomed to failure.

[1100] Through imitation, one's own values become *reactivated*. If the way to imitation is cut off, they are nipped in the bud. The result is helpless anxiety. If the imitation is a demand made by the analyst, i.e., if it is a demand for the sake of adaptation, this again leads to a destruction of the patient's values, because imitation is an automatic process that follows its own laws, and lasts as long and goes as far as is necessary. It has quite definite limits which the analyst can never know. Through imitation the patient learns individuation, because it reactivates his own values.

[1101] The collective function may be divided into two functions, which from the "mystical" or metapsychological point of view are identical:

1. The collective function in relation to society.
2. The collective function in relation to the unconscious.

[1102] The unconscious is, as the collective psyche, the psychological representative of society. The persona can have no relation to the unconscious since it is collectively identical with it, being itself collective. Hence the persona must be extinguished or, in other words, restored to the unconscious. From this arises individuality as one pole that polarizes the unconscious, which in turn produces the counterpole, the God-concept.

[1103] The individual must now consolidate himself by cutting himself off from God and becoming wholly himself. Thereby and at the same time he also separates himself from society. Outwardly he plunges into solitude, but inwardly into hell, distance from God. In consequence, he loads himself with guilt. In order to expiate this guilt, he gives his good to the soul, the soul brings it before God (the polarized unconscious), and God returns a gift (productive reaction of the unconscious) which the soul offers to man, and which man gives to mankind. Or it may go another way:

in order to expiate the guilt, he gives his supreme good, his love, not to the soul but to a human being who stands for his soul, and from this human being it goes to God and through this human being it comes back to the lover, but only so long as this human being stands for his soul. Thus enriched, the lover begins to give to his soul the good he has received, and he will receive it again from God, in so far as he is destined to climb so high that he can stand in solitude before God and before mankind.

[1104] Thus I, as an individual, can discharge my collective function either by giving my love to the soul and so procuring the ransom I owe to society, or, as a lover, by loving the human being through whom I receive the gift of God.

[1105] But here as well there is a discord between collectivity and individuation: if a man's libido goes to the unconscious, the less it goes to a human being; if it goes to a human being, the less it goes to the unconscious. But if it goes to a human being, and it is a true love, then it is the same as if the libido went direct to the unconscious, so very much is the other person a representative of the unconscious, though only if this other person is truly loved.

[1106] Only then does love give him the quality of a mediator, which otherwise and in himself he would not possess.

FOREWORD TO THE HUNGARIAN EDITION OF JUNG: "ON THE PSYCHOLOGY OF THE UNCONSCIOUS"¹

[1107] The Hungarian translation of my book *On the Psychology of the Unconscious*,² by Dr. Peter Nagy, carefully collated and checked by Dr. Jolande Jacobi, deserves to be greeted as a novum since this is the first Hungarian publication of any of my writings. Except for a few translations into Russian, one of my earliest books now appears in a language of Eastern Europe for the first time. I am indebted to Dr. Jacobi not only for making this possible, but more particularly because she was closely associated with the revision of this book and its publication, and was ready with helpful suggestions and useful advice. It is also due to her conscientious collaboration that the Hungarian edition is equipped with an index, lacking in the Swiss edition, as well as with a short glossary to elucidate the terminology, which is often difficult and new, attaching to the theme.

[1108] For it is a particular pleasure that my book is now available in Hungary, a country from which signs of the liveliest interest have again and again come my way. I hope to pay off a little of my debt of gratitude, at least indirectly, with this foreword. Of my many pupils, who all come from the Western half of the world, Dr. Jacobi is the first Hungarian; she has worked for years under my personal direction in Zurich, and in so doing has acquired a profound knowledge of that very extensive and difficult territory, the psychology of the unconscious. In her book *The Psychology of C. G. Jung*,³ an excellent introduction to my work in general, she has given evidence of this. Her knowledge also guarantees the accuracy and fidelity of the translation, so very necessary in dealing with such tricky and delicate material as the psychology of the unconscious.

[1109] This essay makes no claim to be a comprehensive exposition; its aim is to acquaint the reader with the main problems of the psychology of the unconscious, and this only within the limits prescribed by direct medical experience. As it does not pretend to be more than an introduction, the manifold relations with the history of human thought, mythology, religion, philosophy, the psychology of primitives, and so on are only hinted at.

Küsnacht-Zurich, January 1944

IX

THE STRUCTURE AND DYNAMICS OF THE PSYCHE

(related to Volume 8 of the Collected Works)

FOREWORDS TO JUNG: “ÜBER PSYCHISCHE ENERGETIK UND DAS WESEN DER TRÄUME”¹

First Edition (1928)

[1110] In this volume, the second of the *Psychologische Abhandlungen*,² I am publishing four papers of which three have so far appeared only in English.³ One of the papers deals with the still unsolved problem of dream interpretation, while the others are concerned with—in my view—a question of central importance: the fundamental psychic factors, the *dynamic images*, which it seems to me express the nature of psychic energy. My concept of psychic energy, first put forward in *Wandlungen und Symbole der Libido* (1912),⁴ has met with so much opposition and misunderstanding that it seemed to me worth working over the problems of psychic energetics once again, this time not from the practical but from the theoretical side. The reader, therefore, need fear no repetitions.

Küsnacht-Zurich 1928

Second Edition (1948)

[1111] The papers in this volume are attempts to introduce some order into the chaotic profusion of psychic phenomena by means of concepts that are current in other fields of research besides psychology. Since our psychological knowledge is still in its infancy, our primary concern must be with elementary concepts and groups of facts, and not with the individual complications in which our case histories abound, and which can never be completely elucidated. The Freudian “model” of neurosis and dreams gives only a partial explanation of the empirical material. As medical psychologists, we must seek to refine our methods as well as our psychological concepts, more particularly because the “academic” psychologists have abandoned the attempt to investigate the unconscious empirically. It falls to the lot of the medical psychologist to probe more deeply into the compensatory relationship between conscious and unconscious which is so vital for an understanding of the psyche as a whole.

[1112] Except for some improvements I have made no drastic alterations to the text. The number of papers has been increased to six, as I have added a short “Review of the Complex Theory” and some recent aperçus on dream research, “On the Nature of Dreams.”¹

Küsnacht-Zurich, May 1947

ON HALLUCINATION¹

[1113] Hallucination is not merely a pathological phenomenon but one that also occurs in the sphere of the normal. The history of prophecy as well as experiences among primitives show that psychic contents not infrequently come to consciousness in hallucinatory form. In this respect only the form is worthy of note, not the function, which is nothing other than what is commonly called a “brain wave” [*Einfall*]. As the word itself indicates, a certain spontaneity attaches to the phenomenon; it is as though the psychic content had a life of its own and forced its way into consciousness by its own strength. This peculiarity probably explains the ease with which the brain wave assumes an hallucinatory character. Common speech is familiar with these transitions from brain wave to hallucination. In the mildest cases we say: “I thought”; “it occurred to me” is a little stronger; stronger still is “it was as though an inner voice said,” and finally “it was as though someone were calling to me,” or “I heard a voice quite distinctly.”

[1114] Hallucinations of this kind usually derive from the still subliminal, maturer personality which is not yet capable of direct consciousness, as observations of somnambulists show. In the case of primitive medicine-men they come from a subliminal thinking or intuiting which at that level is not yet capable of becoming conscious.

FOREWORD TO SCHLEICH: "DIE WUNDER DER SEELE"¹

[1115] When, after many years, I again took up the works of Carl Ludwig Schleich and tried to capture the mental world of this remarkable thinker in a telling image, what persistently came into my mind was the indelible impression which another powerful thinker—very unlike Schleich and yet so very like him—had made upon me: Paracelsus. Odd bedfellows indeed—the contemporary of the humanists and the modern, forward-looking Schleich, separated by four centuries of spiritual growth and change, not to speak of differences of personality. The very idea would have struck me as preposterous had I not been strangely moved just by the affinity of opposites. Above all, it seemed to me significant that Paracelsus stood at the beginning of an epoch in the history of medicine and Schleich at its end. Both were typical representatives of a period of transition, and both of them revolutionaries. Paracelsus cleared the way for scientific medicine, benighted at times by age-old animistic beliefs yet filled with the liveliest apprehension of an age in which the intangibles of the soul would be replaced by a massive materialism. Schleich was a revolutionary in the opposite sense. Although steeped in anatomical and physiological concepts, he boldly reached out towards the very same psychic realm upon which Paracelsus, obeying the dictates of his age, had half-reluctantly turned his back. Both were enthusiasts, uplifted and fortified by the certitudes of their vision, optimistically credulous, rejoicing in their hopes, pioneers of a new spiritual outlook who went their head-spinning way sure-footed and undismayed. Both gazed fearlessly into suprahuman, metaphysical abysses and both avowed their faith in the eternal images deeply engraved in the human psyche. Paracelsus' way took him down to the divine but essentially pre-Christian *prima materia*, the "Hyliaster."² Schleich, starting from the darkness of the blood vessels, ducts, and the labyrinth of the nerve-endings, mounted the ganglionic ladder of the sympathetic nervous system to a transcendental soul which appeared to him in all its Platonic glory in the "supracelestial place." Both were inspired by the effervescence of an age of decay and change. Both were born out of their time, eccentric figures eyed askance by their contemporaries. One's contemporaries are always dense and never understand that enthusiasm, and what appears to them to be unseemly ebullience come less from personal temperament than from the still unknown well-springs of a new age. How people looked askance at Nietzsche's volcanic emotion, and how long he will be spoken of in times to come! Even Paracelsus has now been gratefully disinterred after four hundred years in an attempt to resuscitate him in modern dress. What will

happen with Schleich? We know that he was aiming at that unitary vision of psychic and physical processes which has given the strongest impetus to medical and biological research today. Though hampered by a terminology inherited from an age of scientific materialism, he broke through the narrow confines of a de-psychized materiality and crossed the threshold, barricaded with thorny prejudices, which separated the soul from the body. And though he had no knowledge of my own efforts, which for a long time remained unknown to the scientific public in Germany, in his own way he fought shoulder to shoulder with me for the recognition of the soul as a factor *sui generis*, and thus broke a new path for psychology, which till then had been condemned to get along without a psyche.

[1116] The breakthrough initiated by Paracelsus led the way out of medieval scholasticism into the then unknown world of matter. This is the great and essential service which has placed medicine forever in his debt. And it is not isolated facts, methods, or laws which make Schleich important for us, but his pushing forward into a new field of vision where the mass of known facts appears in a new and different light. By syncretizing all our previous knowledge and seeking a standpoint from which to gain a view of the whole, he succeeded in escaping from the charmed circle of pure empiricism and touched upon the very foundation of the empirical method itself, though most people are quite unaware of it. This fundamental thing is the relation of the body's chemistry to psychic life. Paracelsus ultimately decided in favour of "chemism," despite his allegiance to a view of the world dominated by the spirit as the highest authority. Schleich, four hundred years later, decided in favour of psychic animation, and thus raised the psyche from its undignified position as a subsidiary product to that of the *auctor rerum*. With a bold stroke he put the mechanisms and chemisms of the body in a new hierarchy. The "vestigial" sympathetic nervous system, an apparently fortuitous tangle of ganglionic nodes that regulate the vegetative functions of the body in an astoundingly purposive way, becomes the matrix of the cerebrospinal system, whose crowning miracle, the brain, seems to our fascinated gaze the controller of all bodily processes. Nay more: the sympathetic system is, for Schleich, the mysterious "cosmic nerve," the true "ideoplast," the original and most immediate realization of a body-building and body-sustaining World Soul, which was there before mind and body came into existence. The Hyliaster of Paracelsus is thus stripped of its unfathomable creative secret. Once again the solidity and tangibility of matter, so fervently believed in and so convincing to the senses, dissolve into Maya, into a mere emanation of primordial thought and will, and all hierarchies and all values are reversed. The intangible, the psyche, becomes the ground and substrate, and the "merely vegetative" sympathetic system the possessor and realizer of unthinkable creative secrets, the vehicle of the life-giving World Soul, and, ultimately, the architect of the brain, this newest

achievement of the pre-existent creative will. What lay modestly hidden beneath the overwhelming grandeur of the cerebrospinal system, which, as the vehicle of consciousness, seems to be identical with the psyche as such—this same sympathetic system is “psyche” in a deeper and more embracing sense than is the interplay of the cortical fields of the cerebrum. Notwithstanding its quantitative and qualitative insignificance, it is the exponent of a psyche far excelling consciousness both in depth and scope, and is not, like this, defencelessly exposed to the potions of the endocrine system, but itself creates these magical secretions with single-minded purposiveness.

[1117] Just as Paracelsus laboured to concoct sylphids and succubi out of mandrakes, hangman’s amulets, and the blackest folk-medicine in his alchemical retort while yet having intimations of the truth, so Schleich spoke the language of the best “brain mythology” of the pre-war era and yet penetrated into the deepest problems and symbols of the human psyche, following his inner intuition and without knowing what he was doing. His soaring imagination transmuted figures of speech into forms which, unbeknownst to him, are actually archetypes of the collective unconscious that manifest themselves wherever introspection seeks to plumb the depths of the psyche, as for instance in Indian and Chinese yoga.

[1118] Schleich was thus a pioneer not only in somatic medicine but also in the remoter reaches of psychology, where it coalesces with the vegetative processes of the body. This is without doubt the darkest area of all, which scientific research has long sought to elucidate in vain. It is just this darkness which fascinated Schleich’s mind and let loose a spate of imaginative ideas. Though they were not based on any new facts, they will certainly stimulate new interpretations and new modes of observation. As the history of science shows, the progress of knowledge does not always consist in the discovery of facts but, just as often, in opening up new lines of inquiry and in formulating hypothetical points of view. One of Schleich’s favourite ideas was that of a psyche spread through the whole of the body, and dependent more on the blood than on grey matter. This is a brilliant notion of incalculable import. It enabled him to reach certain conclusions as to the way in which the psychic processes are determined, and these conclusions have independently confirmed my own research work. I am thinking chiefly of the historical factors determining the psychic background, as formulated in my theory of the collective unconscious. The same might be said of the mysterious connections between the psyche and the geographical locality, which Schleich linked up with dietetic differences—a possibility that should not be dismissed out of hand. When one considers the remarkable psychic and biological changes to which European immigrants are subject in America,³ one cannot help feeling that in this matter science has still a number of important problems to solve.

[1119] Although Schleich's thought and language were wholly dependent on the data of the body, he was nevertheless impressed by the incorporeal nature of the psyche. What struck him about dreams was their spacelessness and timelessness, and for him hysteria was a "metaphysical problem"—metaphysical because the "ideoplastic" capacities of the unconscious psyche were nowhere more palpably in evidence than in the neuroses. Marvelling he gazed at the bodily changes wrought by the unconscious in hysteria. One can see from this almost childlike amazement how new and unexpected such observations were for him, although for the psychopathologist they have long been truisms. But one also sees from what generation of medical men he came—a generation blinded by prejudice, that passed unheedingly by the workings of the psyche upon the body, and even with its first, groping steps in psychology believed that the psyche could be dispensed with. Considering this lack of psychological knowledge, it is all the more astonishing and greatly to Schleich's credit that he was able to break through to a recognition of the psyche and to a complete reversal of biological causality. His conclusions seem almost too radical to the psychologist, or at any rate over-audacious, since they trespass upon regions which philosophical criticism must put beyond the bounds of human understanding.

[1120] Schleich's limited knowledge of psychology and his enthusiasm for intuitive speculation are responsible for a certain lack of reflection and for the occasional shallow patches in his work, for instance, his blindness to the psychic processes in dreams, which he sees through the spectacles of materialistic prejudice. Again, there is no inkling of the philosophical and moral problems that are conjured up by his identification of conscience with the function of hormones. Schleich thus paid tribute to the scientific past and to the spirit of the Wilhelmine era, when the authority of science swelled into blind presumption and the intellect turned into a ravaging beast. But he saw very clearly that if medicine considered only the body and had no eyes for the living man, it was doomed to stultification. For this reason he turned away from the investigation of mere facts and used his knowledge of biology for wider purposes, to construct a bold synoptic view which would eradicate the grave errors of an obsolete materialism. The nineteenth century did everything it could to bring the psyche into disrepute, and it is Schleich's great achievement to have thrust the psychic meaning of vital processes into the light of day. His works may serve as an introduction to the revolution that has taken place in our general outlook and extricated us from the straitjacket of academic specialism.

FOREWORD TO JACOBI: "THE PSYCHOLOGY OF C. G. JUNG"¹

[1121] The present work, I believe, meets a generally felt need which I myself up to now have not been in a position to satisfy—the wish for a concise presentation of the elements of my psychological theories. My endeavours in psychology have been essentially pioneer work, leaving me neither time nor opportunity to present them systematically. Dr. Jacobi has taken this difficult task upon herself with a happy result, having succeeded in giving an account free from the ballast of technical particulars. It is a synopsis that includes or at least touches upon all essential points, so that it is possible for the reader—with the aid of the references and the bibliography of my writings—to orient himself readily wherever needful. An additional merit is that the text has been supplemented with a number of diagrams, which are a help in understanding certain functional relations.

[1122] It is a particular satisfaction to me that the author has been able to avoid furnishing any support to the opinion that my researches constitute a doctrinal system. Expositions of this kind slip all too easily into a dogmatic style which is wholly inappropriate to my views. Since it is my firm conviction that the time for an all-inclusive theory, taking in and describing all the contents, processes, and phenomena of the psyche from one central viewpoint, has not yet arrived, I regard my concepts as tentative attempts to formulate a scientific psychology based in the first place upon immediate experience with human beings. This is not a kind of psychopathology, but a general psychology which also takes cognizance of the empirical material of pathology.

[1123] I hope that it may be the lot of this book not only to give the general reader an insight into my researches, but also to save him much laborious searching in his study of them.

August 1939

Foreword to the Spanish Edition¹

[1124] It gives me particular pleasure to know that this book is now appearing in a Spanish translation. It will acquaint the Spanish public with the most recent developments of a psychology that has grown out of the experiences of the physician's art. This psychology is concerned with complex psychic phenomena that are continually encountered in daily life. It is not an abstract academic science, but a formulation of practical experiences which remains faithful to the scientific method.

As a result, this psychology includes within its scope wide areas of other sciences and of life in general. My very best wishes accompany this book on its journey through the world.

FOREWORD TO HARDING: "PSYCHIC ENERGY"¹

[1125] This book presents a comprehensive survey of the experiences of analytical practice, a survey such as anyone who has spent many years in the conscientious pursuit of professional duties may well feel the need of making. In the course of time, insights and recognitions, disappointments and satisfactions, recollections and conclusions mount to such proportions that one would gladly rid oneself of the burden of them in the hope not merely of throwing out worthless ballast but also of presenting a summation which will be useful to the world of today and of the future.

[1126] The pioneer in a new field rarely has the good fortune to be able to draw valid conclusions from his total experience. The efforts and struggles, the doubts and uncertainties of his voyage of discovery have penetrated his marrow too deeply to allow him the perspective and clarity of vision needed for a comprehensive survey. Those of the second generation, who base their work on the groping experiments, the lucky hits, the circuitous approaches, the half truths and mistakes of the pioneer, are less burdened and can take more direct roads, envisage more distant goals. They can cast off many doubts and hesitations, concentrate on essentials, and, in this way, map out a simpler and clearer picture of the newly discovered territory. This simplification and clarification redound to the benefit of those of the third generation, who are thus equipped from the outset with an over-all chart. With this chart they are enabled to formulate new problems and mark out the boundary lines more sharply than ever before.

[1127] We can congratulate the author on the success of her attempt to provide a general orientation on the problems of medical psychotherapy in its most modern aspects. Her many years of practical experience have stood her in good stead; without them her undertaking would not have been possible at all. For it is not a question, as many believe, of a "philosophy," but rather of facts and their formulation, which in turn must be tested in practice. Concepts like "shadow" and "anima" are in no sense intellectual inventions. They are designations for psychic facts of a complex nature which are empirically verifiable. These facts can be observed by anyone who takes the trouble to do so and who is able to lay aside his preconceived ideas. Experience shows how difficult this is. For instance, how many people still labour under the delusion that the term archetype denotes an inherited idea! Such completely unwarranted assumptions naturally make any understanding impossible.

[1128] It is to be hoped that Dr. Harding's book, with its simple and lucid exposition, will be especially suited to dispel such absurd misunderstandings. In this respect it

can be of the greatest service not only to the doctor but also to the patient. I should like to emphasize this point particularly. It is obviously necessary for a doctor to have an adequate understanding of the material laid before him; but if he is the only one who understands, it is of no great help to the patient, since he is actually suffering from lack of consciousness and should therefore become more conscious. To this end, he needs knowledge; and the more of it he acquires, the greater is his chance of overcoming his difficulties. For those of my patients who have reached the point where greater spiritual independence is necessary, Dr. Harding's book is one that I should unhesitatingly recommend.

Küsnacht-Zurich, July 8, 1947

ADDRESS ON THE OCCASION OF THE FOUNDING OF THE C. G. JUNG INSTITUTE, ZURICH, 24 APRIL 1948¹

[1129] It is a particular pleasure and satisfaction for me to have the privilege of speaking to you on this memorable day of the founding of an Institute for Complex Psychology. I am honoured that you have come here for the purpose of establishing this institute of research which is designed to carry on the work begun by me. I hope, therefore, I may be allowed to say a few words about what has been achieved up to the present, as well as about our aims for the future.

[1130] As you know, it is nearly fifty years since I began my work as a psychiatrist. At that time, the broad fields of psychopathology and psychotherapy were so much wasteland. Freud and Janet had just begun to lay the foundations of methodology and clinical observation, and Flournoy in Geneva had made his contribution to the art of psychological biography, which is still far from being appreciated at its true value. With the help of Wundt's association experiments, I was trying to evaluate the peculiarities of neurotic states of mind as exactly as possible. In the face of the layman's prejudice that the psyche was something immeasurably subjective and boundlessly capricious, my purpose was to investigate what appeared to be the most subjective and most complicated psychic process of all, namely, the associative reaction, and to describe its nature in numerically expressible quantities. This work led directly to the discovery of the *feeling-toned complex*, and indirectly to a new question, namely, the problem of *attitude*, which exerts a decisive influence upon the associative reaction. The answer to this question was found by clinical observation of patients and by analysis of their behaviour. From these researches there emerged a *psychological typology*, which distinguished two attitude-types, the extravert and the introvert, and four function-types corresponding to the four orienting functions of consciousness.

[1131] The existence of complexes and of typical attitudes could not be adequately explained without the hypothesis of the unconscious. From the beginning, therefore, the above-mentioned experiments and researches went hand in hand with an investigation of unconscious processes. This led, about 1912, to the actual discovery of the *collective unconscious*. The term itself is of a later date. If the theory of complexes and type psychology had already overstepped the bounds of psychiatry proper, with the hypothesis of the collective unconscious the scope of our researches was extended without limit. Not only the domain of normal psychology, but also those of racial psychology, folklore, and mythology in the widest sense became the

subject-matter of complex psychology. This expansion found expression in the collaboration with the sinologist Richard Wilhelm and the indologist Heinrich Zimmer. Both are now dead, but our science has not forgotten the inestimable contribution they made. Wilhelm above all introduced me to medieval Chinese alchemy and thus prepared the ground for an understanding of the rudiments of modern psychology that are to be found in the medieval texts. Into the painful gap left by the death of these two fellow workers there stepped, a few years ago, Karl Kerényi, one of the most brilliant philologists of our time. Thus a wish I personally had long cherished saw fulfillment, and our science was granted a new helper.^{1a}

[1132] The insights gained originally in the domains of psychopathology and normal psychology proved to be keys to the most difficult Taoist texts and to abstruse Indian myths, and Kerényi has now supplied such a wealth of connections with Greek mythology that the cross-fertilization of the two branches of science can no longer be doubted. In the same way that Wilhelm aroused an interest in alchemy and made possible a true interpretation of this little understood philosophy, Kerényi's work has stimulated a large number of psychological researches, in particular the investigation and elucidation of one of the most important problems in psychotherapy, namely, the *phenomenon of the transference*.²

[1133] Recently an unexpected and most promising connection has been forged between complex psychology and physics, or to be more accurate, *microphysics*. On the psychological side, it was first of all C. A. Meier who pointed out the common conception of complementarity. Pascual Jordan approached psychology from the physicist's side by drawing attention to the phenomenon of spatial relativity which applies equally to the phenomena of the unconscious. W. Pauli has taken up the new "psychophysical" problem on a much broader basis, examining it from the standpoint of the formation of scientific theories and their archetypal foundations.³ Recently, in two impressive lectures, he showed on the one hand how the archetypal triad or trinity formed the point of departure for Kepler's astronomy, and on the other how Fludd's polemics with Kepler were based on the alchemical thesis of the quaternity. The object at issue, the *proportio sesquitertia* or ratio of 3 : 1, is likewise a fundamental problem in the psychology of the unconscious. Thirty years ago, the problem first presented itself in psychology as a typological phenomenon, i.e., as the relation of three more or less differentiated functions to one inferior function which was contaminated with the unconscious. Since then it has been considerably widened and deepened by the study of Gnostic and alchemical texts. It appears there partly in the form of the social or folkloristic *marriage quaternio*, derived originally from the primitive cross-cousin-marriage, and partly in the form of a differentiation in the sequence of elements, in which one or the other element, usually fire or earth, is distinguished from the other three. The same problem appears in the controversy

between the trinitarian and the quaternarian standpoint in alchemy. In complex psychology the quaternity symbol has been shown to be an expression of psychic totality, and in the same way it could be established that the *proportio sesquitertia* commonly occurs in the symbolism produced by the unconscious. If, as conjectured, the quaternity or above-named proportion is not only fundamental to all concepts of totality but is also inherent in the nature of observed microphysical processes, we are driven to the conclusion that the space-time continuum, including mass, is psychically relative—in other words, that it forms a unity with the unconscious psyche. Accordingly, there must be phenomena which can be explained only in terms of a psychic relativity of space, time, and mass. Besides numerous individual observations the experiments conducted at Duke University by Rhine and elsewhere by other investigators have furnished sufficient proof of this. You will forgive me if I have dwelt on the latest connections of our psychology with physics at some length. It did not seem to me superfluous in view of the incalculable importance of this question.

[1134] To round out the position of complex psychology as it is at present, I would like to mention some major works by pupils. These include the “Einführung in die Grundlagen der komplexen Psychologie,” by Toni Wolff,⁴ a work distinguished for its philosophical clarity; the books of Esther Harding on feminine psychology;⁵ the analysis of the *Hypnerotomachia* of Francesco Colonna, by Linda Fierz-David,⁶ a showpiece of medieval psychology; the valuable introduction to our psychology by Jolande Jacobi;⁷ the books on child psychology by Frances Wickes,⁸ notable for their interesting material; the great book by H. G. Baynes, *Mythology of the Soul*;⁹ a synoptic study by Gerhard Adler;¹⁰ a large-scale work in several volumes by Hedwig von Roques and Marie-Louise von Franz;¹¹ and finally, a work of significant content and scope on the evolution of consciousness by Erich Neumann.¹²

[1135] Of particular interest are the repercussions of complex psychology in the psychology of religion. The authors here are not my personal pupils. I would draw attention to the excellent book by Hans Schaer¹³ on the Protestant side, and to the writings of W. P. Witcutt¹⁴ and Father Victor White¹⁵ concerning the relations of our psychology to Thomist philosophy, and finally to the excellent account of the basic concepts by Gebhard Frei,¹⁶ whose unusual erudition facilitates an understanding from all sides.

[1136] To the picture of the past and present I must now try to sketch out one for the future. This can naturally take the form only of programmatic hints.

[1137] The manifold possibilities for the further development of complex psychology correspond to the various developmental stages it has already passed through. So far as the experimental aspect is concerned, there are still numerous questions which need to be worked out by experimental and statistical methods. I have had to leave

many beginnings unfinished because of more pressing tasks that claimed my time and energies. The potentialities of the association experiment are by no means exhausted yet. For instance, the question of the periodic renewal of the emotional tone of complex-stimulators is still unanswered; the problem of familial patterns of association has remained stuck in its beginnings, promising though these were; and so has the investigation of the physiological concomitants of the complex.

[1138] In the medical and clinical field there is a dearth of fully elaborated case histories. This is understandable, because the enormous complexity of the material puts almost insurmountable difficulties in the way of exposition and makes the highest demands not only on the knowledge and therapeutic skill of the investigator but also on his descriptive capacity. In the field of psychiatry, analyses of paranoid patients coupled with research into comparative symbolism would be of the utmost value. Special consideration might be given to the collection and evaluation of dreams in early childhood and pre-catastrophal dreams, i.e., dreams occurring before accidents, illness, and death, as well as dreams during severe illnesses and under narcosis. The investigation of pre- and post-mortal psychic phenomena also comes into this category. These are particularly important because of the relativation of space and time that accompanies them. A difficult but interesting task would be research into the processes of compensation in psychotics and in criminals, and in general into the goal of compensation and the nature of its directedness.

[1139] In normal psychology, the most important subjects for research would be the psychic structure of the family in relation to heredity, the compensatory character of marriage and of emotional relationships in general. A particularly pressing problem is the behaviour of the individual in the mass and the unconscious compensation to which this gives rise.

[1140] A rich harvest is to be reaped in the field of the humanities. Here a tremendous prospect opens out, and at present we are standing only on its extreme periphery. Most of it is still virgin territory. The same applies to biographical studies, which are especially important for the history of literature. But above all, analytical work remains to be done on questions concerned with the psychology of religion. The study of religious myths would throw light not only on racial psychology but also on certain borderline problems such as the one I mentioned earlier. In this respect, particular attention would have to be paid to the quaternity symbol and the *proportio sesquitertia*, as exemplified in the alchemical axiom of Maria, both from the side of the psychologist and from that of the physicist. The physicist may have to consider revising his concept of space-time, and for the psychologist there is need of a more thorough investigation and description of triadic and tetradic symbols and their historical development, to which Frobenius has contributed valuable material. Comprehensive studies are also needed of symbols of the goal or of unity.

[1141] This list, put together more or less at random, makes no claim to completeness. What I have said may suffice to give you a rough idea of what has already been achieved in complex psychology and of the direction which future researches conducted by the Institute might be expected to take. Much will remain a mere desideratum. Not all of it will be fulfilled; the individual differences of our workers on the one hand, and the irrationality and unpredictability of all scientific development on the other, will see to that. Happily, it is the prerogative of any institution with limited means, and not run by the State, to produce work of high quality in order to survive.

DEPTH PSYCHOLOGY¹

[1142] “Depth psychology” is a term deriving from medical psychology, coined by Eugen Bleuler to denote that branch of psychological science which is concerned with the phenomenon of the unconscious.

[1143] As a philosophical and metaphysical concept, the unconscious occurs fairly early, for instance as “petites perceptions” in Leibniz,² “eternal unconscious” in Schelling, “unconscious Will” in Schopenhauer, and as the “divine Absolute” in von Hartmann.

[1144] In the academic psychology of the nineteenth century, the unconscious occurs as a basic theoretical concept in Theodor Lipps, who defines it as the “psychic reality which must necessarily be thought to underlie the existence of a conscious content”; and in F. H.W. Myers and William James, who stress the importance of an unconscious psyche. With Theodor Fechner, the unconscious becomes an empirical concept. Nevertheless, the empirical approach to the unconscious may properly be said to date from quite recent times, since up to the turn of the century the psyche was usually identified with consciousness, and this made the idea of the unconscious appear untenable (Wundt).

[1145] The real pioneers of experimental research into the unconscious were Pierre Janet and Sigmund Freud, two medical psychologists whose investigations of pathological psychic life laid the foundations of the modern science of the unconscious. Great credit is due to Janet for his investigation of hysterical states, which he developed in his theory of “partial psychic dissociation,” drawing a distinction between the “partie supérieure” and “partie inférieure” of a function. Equally fruitful was his experimental proof of “idées fixes” and “obsessions,” and of their autonomous effects upon consciousness.

[1146] The prominence given to the unconscious as a fundamental concept of empirical psychology, however, goes back to Freud, the true founder of the depth psychology which bears the name of psychoanalysis. This is a special method of treating psychic illnesses, and consists essentially in uncovering what is “hidden, forgotten, and repressed” in psychic life. Freud was a nerve specialist. His theory was evolved in the consulting room and always preserved its stamp. His fundamental premise was the pathological, neurotically degenerate psyche.

[1147] The development of Freud’s thought can be traced as follows. He began by investigating neurotic symptoms, more particularly hysterical symptom-formation,

whose psychic origin Breuer, employing a method borrowed from hypnotism, had previously discovered in the existence of a causal connection between the symptoms and certain experiences of which the patient was unconscious. In these experiences Freud recognized affects which had somehow got “blocked,” and from which the patient had to be freed. He found there was a meaningful connection between the symptom and the affective experience, so much so that conscious experiences which later became unconscious were essential components of neurotic symptoms. The affects remained unconscious because of their painful nature. In consequence, Freud made no further use of hypnosis in “abreacting” the blocked affects, but developed instead his technique of “free association” for bringing the repressed processes back to consciousness. He thus laid the foundations of a causal-reductive method, of which special use was to be made in his interpretation of dreams.

[1148] In order to explain the origin of hysteria, Freud established the theory of the sexual trauma. He found that traumatic experiences were especially painful because most of them were caused by instinctual impulses coming from the sexual sphere. He assumed to begin with that hysteria in general was due to a sexual trauma in childhood. Later he stressed the aetiological significance of infantile-sexual fantasies that proved to be incompatible with the moral values of consciousness and were therefore repressed. The theory of repression forms the core of Freud’s teaching. According to this theory, the unconscious is essentially a phenomenon of repression, and its contents are elements of the personal psyche that although once conscious are now lost to consciousness. The unconscious would thus owe its existence to a moral conflict.

[1149] The existence of these unconscious factors can be demonstrated, as Freud showed, with the help of parapraxes (slips of the tongue, forgetting, misreading) and above all with the help of dreams, which are an important source of information regarding unconscious contents. It is Freud’s particular merit to have made dreams once more a problem for psychologists and to have attempted a new method of interpretation. He explained them by means of the repression theory, and maintained that they consisted of morally incompatible elements which, though capable of becoming conscious, were suppressed by an unconscious moral factor, the “censor,” and could therefore appear only in the form of disguised wish-fulfillments.

[1150] The instinctual conflict underlying this phenomenon Freud described initially as the conflict between the pleasure principle and the reality principle, the latter playing the part of an inhibiting factor. Later he described it as the conflict between the sexual instinct and the ego-instinct (or between the life-instinct and the death-instinct). The obtaining of pleasure was correlated with the pleasure principle, and the culture-creating impulse with the reality principle. Culture required the sacrifice of instinctual gratification by the whole of mankind and the individual alike.

Resistance to this sacrifice led to secret wish-fulfillments distorted by the “censor.” The danger inherent in this theory was that it made culture appear a substitute for unsatisfied natural instincts, so that complex psychic phenomena like art, philosophy, and religion became “suspect,” as though they were “nothing but” the outcome of sexual repression. It would seem that Freud’s negative and reductive attitude towards cultural values was historically conditioned. His attitude towards myth and religion was that of the scientific materialism of the nineteenth century. As his psychology was mainly concerned with the neuroses, the pathological aspect of the transformation of instinct claims a disproportionately large place in his theory of the unconscious and of the neuroses themselves. The unconscious appears to be essentially an appendix of consciousness; its contents are repressed wishes, affects, and memories that owe their pathogenic significance to infantile sexuality. The most important of the repressed contents is the so-called Oedipus complex, which represents the fixation of infantile sexual wishes on the mother and the resistance to the father arising from feelings of envy and fear. This complex forms the core of a neurosis.

[1151] The question of the dynamics of unconscious fantasy-formations led Freud to a concept of great importance for the further development of depth psychology, namely, the concept of libido. At first he regarded this as the sexual instinct, but later broadened it by assuming the existence of “libidinal affluxes” due to the displacement and dissociability of the libido. Through the investigation of libido-fixations Freud discovered the “transference,” a fundamental phenomenon in the treatment of neurosis. Instead of recollecting the repressed elements, the patient “transfers” them to the analyst in the form of some current experience; that is, he projects them and thereby involves the analyst in his “family romance.” In this way his illness is converted into the “transference neurosis” and is then acted out between them.

[1152] Freud later expanded the concept of the unconscious by calling it the “id” in contradistinction to the conscious ego. (The term derives from Groddeck.) The id represents the natural unconscious dynamism of man, while the ego forms that part of the id which is modified under the influence of the environment or is replaced by the reality principle. In working out the relations between the ego and the id, Freud discovered that the ego contains not only conscious but also unconscious contents, and he was therefore compelled to frame a concept to characterize the unconscious portion of the ego, which he called the “super-ego” or “ego-ideal.” He regarded this as the representative of the parental authority, as the successor of the Oedipus complex, that impels the ego to restrain the id. It manifests itself as conscience, which, invested with the authority of collective morality, continues to display the

character of the father. The super-ego accounts for the activity of the censor in dreams.

[1153] Although Alfred Adler is usually included among the founders of depth psychology, his school of *individual psychology* represents only a partial continuation of the line of research initiated by his teacher Freud. Confronted with the same empirical material, Adler considered it from an entirely different point of view. For him, the primary aetiological factor was not sexuality but the power-drive. The neurotic individual appeared to him to be in conflict with society, with the result that his spontaneous development was blocked. On this view the individual never exists for himself alone; he maintains his psychic existence only within the community. In contrast to the emphasis Freud laid on instinctual strivings, Adler stressed the importance of environmental factors as possible causes of neurosis. Neurotic symptoms and disturbances of personality were the result of a morbidly intensified valuation of the ego, which, instead of adapting to reality, develops a system of "guiding fictions." This hypothesis gives expression to a finalistic viewpoint diametrically opposed to the causal-reductive method of Freud, in that it emphasizes the direction towards a goal. Each individual chooses a guiding line as a basic pattern for the organization of all psychic contents. Among the possible guiding fictions, Adler attached special importance to the winning of superiority and power over others, the urge "to be on top." The original source of this misguided ambition lies in a deep-rooted feeling of inferiority, necessitating an over-compensation in the form of security. A primary organ-inferiority, or inferiority of the constitution as a whole, often proves to be an aetiological factor. Environmental influences in early childhood play their part in building up this psychic mechanism, since it is then that the foundations are laid for the development of the guiding fiction. The fiction of future superiority is maintained by tendentiously distorting all valuations and giving undue importance to being "on top" as opposed to "underneath," "masculine" as opposed to "feminine," a tendency which finds its clearest expression in the so-called "masculine protest."

[1154] In Adler's individual psychology, Freud's basic concepts undergo a process of recasting. The Oedipus complex, for example, loses its importance in view of the increasing drive for security; illness becomes a neurotic "arrangement" for the purpose of consolidating the life-plan. Repression loses its aetiological significance when understood as an instrument for the better realization of the guiding fiction. Even the unconscious appears as an "artifice of the psyche," so that it may very well be asked whether Adler can be included among the founders of depth psychology. Dreams, too, he regarded as distortions aiming at the fictive security of the ego and the strengthening of the power drive. Nevertheless, the services rendered by Adler and his school to the phenomenology of personality disturbances in children should

not be overlooked. Above all, it must be emphasized that a whole class of neuroses can in fact be explained primarily in terms of the power drive.

[1155] Whereas Freud started out as a neurologist, and Adler later became his pupil, C. G. Jung was a pupil of Eugen Bleuler and began his career as a psychiatrist. Before he came into contact with Freud's ideas, he had, in treating a case of somnambulism in a fifteen-year-old girl (1899), observed that her unconscious contained the beginnings of a future personality development, which took the form of a split (or "double") personality. Through experimental researches on association (1903) he found that in normal individuals as well as in neurotics the reactions to word-tests were disturbed by split-off ("repressed") emotional *complexes* ("feeling-toned complexes of ideas"), which manifested themselves by means of definite symptoms ("complex-indicators"). These experiments confirmed the existence of the repressions described by Freud and their characteristic consequences. In 1906 Jung gave polemical support to Freud's discovery. The theory of complexes maintains that neurosis is caused by the splitting-off of a vitally important complex. Similar splinter-complexes can be observed in schizophrenia. In this disease the personality is, as it were, broken up into its complexes, with the result that the normal ego-complex almost disappears. The splinter-complexes are relatively autonomous, are not subject to the conscious will, and cannot be corrected so long as they remain unconscious. They lend themselves to personification (in dreams, for instance), and, with increasing dissociation and autonomy, assume the character of partial personalities (hence the old view of neuroses and psychoses as states of possession).

[1156] In 1907 Jung became personally acquainted with Freud, and derived from him a wealth of insights, particularly in regard to dream psychology and the treatment of neurosis. But in certain respects he arrived at views which differed from those of Freud. Experience did not seem to him to justify Freud's sexual theory of neurosis, and still less that of schizophrenia. The conception of the unconscious needed to be broadened, inasmuch as the unconscious was not just a product of repression but was the creative matrix of consciousness. Equally, he was of the opinion that the unconscious could not be explained in personalistic terms, as a merely personal phenomenon, but that it was also in part collective. Accordingly, he rejected the view that it possessed a merely instinctual nature, as well as rejecting the wish-fulfillment theory of dreams. Instead, he emphasized the compensatory function of the unconscious processes and their teleological character. For the wish-fulfillment theory he substituted the concept of development of personality and development of consciousness, holding that the unconscious does not consist only of morally incompatible wishes but is largely composed of hitherto undeveloped, unconscious portions of the personality which strive for integration in the wholeness of the individual. In the neurotic, this process of realization is manifested in the conflict

between the relatively mature side of the personality and the side which Freud rightly described as infantile. The conflict has at first a purely personal character and can be explained personalistically, as the patients themselves do, and moreover in a manner which agrees both in principle and in detail with the Freudian explanation. Their standpoint is a purely personal and egoistic one, and takes no account of the collective factors, this being the very reason why they are ill. In schizophrenics, on the other hand, the collective contents of the unconscious predominate strongly in the form of mythological motifs. Freud could not subscribe to these modifications of his views, so Jung and he parted company.

[1157] Such differences of viewpoint, further increased by the contradiction between Freud's and Adler's explanation of neurosis, prompted Jung to investigate more closely the important question of the conscious attitude, on which the compensatory function of the unconscious depends. Already in his association experiments he had found indications of an *attitude-type*, and this was now confirmed by clinical observations. As a general and habitual disposition in every individual, there proved to be a more or less pronounced tendency towards either *extraversion* or *introversion*, the focus of interest falling in the first case on the object, and in the second on the subject. These attitudes of consciousness determine the corresponding modes of compensation by the unconscious: the emergence in the first case of unconscious demands upon the subject, and in the second of unconscious ties to the object. These relationships, in part complementary, in part compensatory, are complicated by the simultaneous participation of the variously differentiated *orienting functions* of consciousness, namely, *thinking*, *feeling*, *sensation*, and *intuition*, which are needed for a whole judgment. The most differentiated ("superior") function is complemented or compensated by the least differentiated ("inferior") function, but at first only in the form of a conflict.

[1158] Further investigation of the collective material of the unconscious, presented by schizophrenics and by the dreams of neurotics and normal people, elicited typical figures or motifs which have their counterparts in myth and may therefore be called *archetypes*. These are not to be thought of as inherited ideas; rather, they are the equivalent of the "pattern of behaviour" in biology. The archetype represents a mode of psychic behaviour. As such, it is an "irrepresentable" factor which unconsciously arranges the psychic elements so that they fall into typical configurations, much as a crystalline grid arranges the molecules in a saturated solution. The specific associations and memory images forming these configurations vary endlessly from individual to individual; only the basic pattern remains the same. One of the clearest of these archetypal figures is the *anima*, the personification of the unconscious in feminine form. This archetype is peculiar to masculine psychology, since the unconscious of a man is by nature feminine, probably owing to the fact that sex is

determined merely by a preponderance of masculine genes, the feminine genes retreating into the background. The corresponding role in a woman is played by the *animus*. A figure common to both sexes is the *shadow*, a personification of the inferior side of the personality. These three figures appear very frequently in the dreams and fantasies of normal people, neurotics and schizophrenics. Less frequent is the archetype of the *wise old man* and of the *earth mother*. Besides these there are a number of functional and situational motifs, such as ascent and descent, the crossing (ford or strait), tension and suspension between opposites, the world of darkness, the breakthrough (or invasion), the creation of fire, helpful or dangerous animals, etc. Most important of all is the supposedly central archetype or *self*, which seems to be the point of reference for the unconscious psyche, just as the ego is the point of reference for consciousness. The symbolism associated with this archetype expresses itself on the one hand in circular, spherical, and quaternary forms, in the “squaring of the circle,” and in mandala symbolism; on the other hand in the imagery of the supraordinate personality (God-image, Anthropos symbolism).

[1159] These empirical findings show that the unconscious consists of two layers: a superficial layer, representing the *personal unconscious*, and a deeper layer, representing the *collective unconscious*. The former is made up of personal contents, i.e., things forgotten and repressed, subliminal or “extrasensory” perceptions and anticipations of future developments, as well as other psychic processes that never reach the threshold of consciousness. A neurosis originates in a conflict between consciousness and the personal unconscious, whereas a psychosis has deeper roots and consists in a conflict involving the collective unconscious. The great majority of dreams contain mainly personal material, and their protagonists are the ego and the shadow. Normally, the dream material serves only to compensate the conscious attitude. There are, however, comparatively rare dreams (the “big” dreams of primitives) which contain clearly recognizable mythological motifs. Dreams of this sort are of especial importance for the development of personality. Their psychotherapeutic value was recognized even in ancient times.

[1160] Since the personal unconscious contains the still active residues of the past as well as the seeds of the future, it exerts a direct and very considerable influence on the conscious behaviour of the individual. All cases of unusual behaviour in children should be investigated for their psychic antecedents through rigorous interrogation of both child and parents. The behaviour of the parents, whether they have open or hidden conflicts, etc., has an incalculable effect on the unconscious of the child. The causes of infantile neurosis are to be sought less in the children than in the parents or teachers. The teacher should be more conscious of his shadow than the average person, otherwise the work of one hand can easily be undone by the other. It is for

this reason that medical psychotherapists are required to undergo a training analysis, in order to gain insight into their own unconscious psyche.

[1160a] Thanks to the parallelism between mythological motifs and the archetypes of the unconscious, depth psychology has been applied in widely differing fields of research, especially by students of mythology, folklore, comparative religion, and the psychology of primitives (Richard Wilhelm, Heinrich Zimmer, Karl Kerényi, Hugo Rahner, Erich Neumann), as was also the case with the Freudian school earlier (Karl Abraham, Otto Rank, Ernest Jones). As the archetypes have a “numinous” quality and underlie all religious and dogmatic ideas, depth psychology is also of importance for theology.

[1161] The activity of the collective unconscious manifests itself not only in compensatory effects in the lives of individuals, but also in the mutation of dominant ideas in the course of the centuries. This can be seen most clearly in religion, and, to a lesser extent, in the various philosophical, social, and political ideologies. It appears in most dangerous form in the sudden rise and spread of psychic epidemics, as for instance in the witch hunts in Germany at the end of the fourteenth century, or in the social and political utopias of the twentieth century. How far the collective unconscious may be considered the efficient cause of such movements, or merely their material cause, is a question for ethnologists and psychologists to decide; but certain experiences in the field of individual psychology indicate the possibility of a spontaneous activity of archetypes. These experiences usually concern individuals in the second half of life, when it not infrequently happens that drastic changes of outlook are thrust upon them by the unconscious as a result of some defect in their conscious attitude. While the activity of the personal unconscious is confined to compensatory changes in the personal sphere, the changes effected by the collective unconscious have a collective aspect: they alter our view of the world, and, like a contagion, infect our fellow men. (Hence the astonishing effects of certain psychopaths on society!)

[1162] The regulating influence of the collective unconscious can be seen at work in the psychic development of the individual, or *individuation process*. Its main phases are expressed by the classic archetypes that are found in the ancient initiation mysteries and in Hermetic philosophy. These archetypal figures appear in projected form during the transference. Freud recognized only the personal aspect of this psychotherapeutically very important phenomenon. Despite appearances to the contrary, its real psychotherapeutic value does not lie in the sphere of personal problems (a misunderstanding for which the neurotic patient has to pay dearly), but in the projection of archetypal figures (anima, animus, etc.). The archetypal relationships thus produced during the transference serve to compensate the unlimited exogamy of our culture by a realization of the unconscious endogamous

tendency. The goal of the psychotherapeutic process, the self-regulation of the psyche by means of the natural drive towards individuation, is expressed by the above-mentioned mandala and Anthropos symbolism.

FOREWORD TO THE FIRST VOLUME OF STUDIES FROM THE C. G. JUNG INSTITUTE¹

[1163] The works which the Institute proposes to publish in this series derive from many different spheres of knowledge. This is understandable since they are predominantly psychological in character. Psychology, of its very nature, is the intermediary between the disciplines, for the psyche is the mother of all the sciences and arts. Anyone who wishes to paint her portrait must mingle many colours on his palette. In order to do justice to its subject, psychology has to rely on any number of auxiliary sciences, on whose findings its own growth and prosperity depend. The psychologist gratefully acknowledges his borrowings from other sciences, though he has neither the intention nor the ambition to usurp their domains or to “know better.” He has no wish to intrude into other fields but restricts himself to using their findings for his own purposes. Thus, for example, he will not use historical material in order to write history but rather to demonstrate the nature of the psyche—a concern which is foreign to the historian.

[1164] The forthcoming publications in this series will show the great diversity of psychological interests and needs. Recent developments in psychological research, in particular the psychology of the collective unconscious, have confronted us with problems which require the collaboration of other sciences. The facts and relationships unearthed by the analysis of the unconscious offer so many parallels to the phenomenology of myths, for example, that their psychological elucidation may also shed light on the mythological figures and their symbols. At all events, we must gratefully acknowledge the invaluable support psychology has received from students of myths and fairy-tales, as well as from comparative religion, even if they on their part have not yet learnt how to make use of its insights. The psychology of the unconscious is still a very young science which must first justify its existence before a critical public. This is the end which the publications of the Institute are designed to serve.

September 1948

FOREWORD TO FRIEDA FORDHAM: "INTRODUCTION TO JUNG'S PSYCHOLOGY"¹

[1165] Mrs. Frieda Fordham has undertaken the by no means easy task of producing a readable résumé of all my various attempts at a better and more comprehensive understanding of the human psyche. As I cannot claim to have reached any definite theory explaining all or even the main part of the psyche's complexities, my work consists of a series of different approaches, or one might call it a circumambulation of unknown factors. This makes it rather difficult to give a clear-cut and simple account of my ideas. Moreover, I always felt a particular responsibility not to overlook the fact that the psyche does not reveal itself only in the doctor's consulting-room, but above all in the wide world, as well as in the depths of history. What the doctor observes of its manifestations is an infinitesimal part of the psychic world, and moreover often distorted by pathological conditions. I was always convinced that a fair picture of the psyche could be obtained only by a comparative method. But the great disadvantage of such a method is that one cannot avoid the accumulation of comparative material, with the result that the layman becomes bewildered and loses his tracks in the maze of parallels.

[1166] The author's task would have been much simpler if she had been in possession of a neat theory for a *point de départ*, and of well-defined case material without digressions into the immense field of general psychology. The latter, however, seems to me to form the only safe basis and criterion for the evaluation of pathological phenomena, even as normal anatomy and physiology are an indispensable precondition for a study of their pathological aspects. Just as human anatomy has a long evolution behind it, the psychology of modern man depends upon its historical roots and can only be judged by its ethnological variants. My works offer innumerable possibilities of side-tracking the reader's attention with considerations of this sort.

[1167] Under those somewhat trying conditions the author has nevertheless succeeded in extricating herself from all the opportunities to make mis-statements. She has presented a fair and simple account of the main aspects of my psychological work. I am indebted to her for this admirable piece of work.

September 1952

FOREWORD TO MICHAEL FORDHAM: "NEW DEVELOPMENTS IN ANALYTICAL PSYCHOLOGY"¹

[1168] It is not easy to write a foreword to a book consisting of a collection of essays, especially when each essay requires one to take up an attitude or stimulates the reader into discursive comments. But this is just what Dr. Fordham's papers do: every single one of them is so carefully thought out that the reader can hardly avoid holding a conversation with it. I do not mean in a polemical sense, but rather in the sense of affirmation and in the desire to carry the objective discussion a stage further and collaborate on the solution of the problems involved. Opportunities for such enjoyable dialogues are unfortunately rather rare, so that one feels it as a distinct loss when one has to forgo them. A foreword ought not to make remarks to the author and, so to speak, buttonhole him for a private conversation. It ought, rather, to convey to the reader something of the impressions which the writer of the foreword received when reading the manuscript. If I may be forgiven a somewhat frivolous expression, the foreword should be content with the role of an intellectual aperitif.

[1169] Thus I can confess myself grateful for the stimulation the book has brought me, and salute the author's collaboration in the field of psychotherapy and analytical psychology. For in this territory questions arise of a practical and theoretical kind, which are so difficult to answer that they will continue to exercise our minds for a long time to come. Above all I would like to draw attention to Dr. Fordham's discussion of the problem of synchronicity, first mooted by me and now dealt with by him in a masterly manner. I must rate his achievement all the higher because it demands not only understanding, but courage too, not to let oneself be prevented from going more deeply into this problem by the prejudices of our intellectual compeers. Also I must acknowledge that the author has in no wise succumbed to the very understandable temptation to underestimate the problem, to pass off one's own lack of comprehension as the stupidity of others, to substitute other terms for the concepts I have proposed and to think that something new has been said. Here Dr. Fordham's feeling for essentials is confirmed in the finest way.

[1170] The paper on the transference merits attentive reading. Dr. Fordham guides his reader through the multifarious aspects of this "problem with horns"—to use an expression of Nietzsche's—with circumspection, insight, and caution, as befits this in every respect delicate theme. The problem of the transference occupies a central position in the dialectical process of analytical psychology and therefore merits quite special interest. It makes the highest demands not only on the doctor's knowledge

and skill but also on his moral responsibility. Here the truth of the old alchemical dictum is proved yet again: “ars totum requirit hominem” (the art requires the total man). The author takes full account of the overriding importance of this phenomenon and accordingly devotes to it a particularly attentive and careful exposition. The practising psychologist would be very wrong if he thought he could dismiss general considerations of this kind based on broader principles, and dispense with all deeper reflection. Even if psychotherapy admits of numerous provisional and superficial solutions in practice, the practising analyst will nevertheless come up against cases from time to time that challenge him as a man and a personality in a way that may be decisive. The usual interim solutions and other banal expedients, such as appeals to collective precepts, which are invariably constructed with “must” or “ought,” then have a habit of breaking down, and the question of ultimate principles, or of the ultimate meaning of the individual, arises. This is the moment when dogmatic tenets and pragmatic rules of thumb must make way for a creative solution issuing from the total man, if his therapeutic endeavours are not to get miserably silted up and stuck. In such cases he will need reflection and will be thankful to those who have been farsighted enough to struggle for an all-round understanding.

[1171] For it is not only a routine performance that is expected of the analyst, but also a readiness and ability to master unusual situations. This is particularly true of psychotherapy, where in the last analysis we are concerned with the whole of the human personality and not merely with life in its partial aspects. Routine cases can be disposed of in a variety of ways—with good advice, with suggestion, with a bit of training, with confession of sin, with any more or less plausible system of views and methods. It is the uncommon cases that set us the master test, by forcing us into fundamental reflections and demanding decisions of principle. From this vantage point we shall then discover that even in ordinary cases there is adumbrated a line that leads to the central theme, namely, the individuation process with its problem of opposites.

[1172] This level of insight cannot be reached without the dialectical discussion between two individuals. Here the phenomenon of the transference forcibly brings about a dialogue that can only be continued if both patient and analyst acknowledge themselves as partners in a common process of approximation and differentiation. For, in so far as the patient frees himself from his infantile state of unconsciousness and its restrictive handicaps, or from its opposite, namely unbounded egocentricity, the analyst will see himself obliged to diminish the distance between them (hitherto necessary for reasons of professional authority), to a degree that does not prevent him from displaying that measure of humanity which the patient needs in order to assure himself of his right to exist as an individual. Just as it is the duty of parents and educators not to keep children on the infantile level but to lead them beyond it, so it

is incumbent on the analyst not to treat patients as chronic invalids but to recognize them, in accordance with their spiritual development and insight, as more or less equal partners in the dialogue, with the same rights as himself. An authority that deems itself superior, or a personality that remains *hors concours*, only increases the patient's feelings of inferiority and of being excluded. An analyst who cannot risk his authority will be sure to lose it. In order to maintain his prestige he will be in danger of wrapping himself in the protective mantle of a doctrine. But life cannot be mastered with theories, and just as the cure of neurosis is not, ultimately, a mere question of therapeutic skill, but is a moral achievement, so too is the solution of problems thrown up by the transference. No theory can give us any information about the ultimate requirements of individuation, nor are there any recipes that can be applied in a routine manner. The treatment of the transference reveals in a pitiless light what the healing agent really is: it is the degree to which the analyst himself can cope with his own psychic problems. The higher levels of therapy involve his own reality and are the acid test of his superiority.

[1173] I hope Dr. Fordham's book, which is distinguished for its farsightedness, carefulness, and clarity of style, will meet with the interest it so much deserves.

June 1957

AN ASTROLOGICAL EXPERIMENT¹

[1174] In the Swiss edition² I purposely set out the results of the astrological statistics in tabular form in this chapter, so that the reader could gain some insight into the behaviour of the figures—in other words, see for himself how fortuitous these results were. Subsequently, I wanted to suppress that account of the experiment in the English edition and for a very peculiar reason indeed. That is, it has been forcibly borne in on me that practically nobody has understood it the right way, despite—or perhaps because—of the fact that I took the trouble to describe the experiment in great detail and in all its vicissitudes. Since it involved the use of statistics and comparative frequencies, I had the (as it now seems) unlucky idea that it would be helpful to present the resultant figures in tabular form. But evidently the suggestive effect emanating from statistical tables is so strong that nobody can rid himself of the notion that such an array of figures is somehow connected with the tendentious desire to *prove* something. Nothing could have been further from my mind, because all I intended to do was to describe a certain sequence of events in all its aspects. This altogether too unassuming intention was misunderstood all round, with the consequence that the meaning of the whole exposition went by the board.

[1175] I am not going to commit this mistake again, but shall make my point at once by anticipating the result: the experiment shows how synchronicity plays havoc with statistical material. Even the choice of my material seems to have thrown my readers into confusion, since it is concerned with *astrological* statistics. One can easily imagine how obnoxious such a choice must be to a prudish intellectualism. Astrology, we are told, is unscientific, absolute nonsense, and everything to do with it is branded as rank superstition. In such a dubious context, how could columns of figures mean anything except an attempt to furnish proofs in favour of astrology, proofs whose invalidity is a foregone conclusion? I have already said that there was never any question of that—but what can words do against numerical tables?

[1176] We hear so much of astrology nowadays that I determined to inquire a little more closely into the empirical foundations of this intuitive method. For this reason I picked on the following question: *How do the conjunctions and oppositions of the sun, moon, Mars, Venus, ascendant, and descendant behave in the horoscopes of married people?* The sum of all these aspects amount to fifty.

[1177] The material to be examined, namely, marriage horoscopes, was obtained from friendly donors in Zurich, London, Rome, and Vienna. The horoscopes, or rather the birth data, were piled up in chronological order just as the post brought them in. The

misunderstanding already began here, as several astrological authorities informed me that my procedure was quite unsuited to evaluating the marriage relationship. I thank these amiable counsellors, but on my side there was never any intention of evaluating marriage astrologically but only of investigating the question raised above. As the material only trickled in very slowly I was unable to restrain my curiosity any longer, and I also wanted to test out the methods to be employed. I therefore took the 360 horoscopes (i.e., 180 pairs) that had so far accumulated and gave the material to my coworker, Dr. Liliane Frey-Rohn, to be analysed. I called these 180 pairs the “first batch.”

[1178] Examination of this batch showed that the conjunction of sun (masculine) and moon (feminine) was the most frequent of all the 50 aspects, occurring in 10% of all cases. The second batch, evaluated later, consisted of 440 additional horoscopes (220 pairs) and showed as the most frequent aspect a moon-moon conjunction (10.9%). A third batch, consisting of 166 horoscopes (83 pairs), showed as the most frequent aspect the ascendant-moon conjunction (9.6%).

[1179] What interested me most to begin with was, of course, the question of probability: were the maximum results obtained “significant” figures or not; that is, were they improbable or not? Calculations undertaken by a mathematician showed unmistakably that the average frequency of 10% in all three batches is far from representing a significant figure. Its probability is much too great; in other words, there is no ground for assuming that our maximum frequencies are more than mere dispersions due to chance. Thus far the result of our statistics (which nevertheless cover nearly one thousand horoscopes) is disappointing for astrology. The material is, however, much too scanty for us to be able to draw from it any conclusions either for or against.

[1180] But if we look at the results qualitatively, we are immediately struck by the fact that in all three batches it is a *moon conjunction*, and what is more—a point which the astrologer will doubtless appreciate—a conjunction of moon and sun, moon and moon, moon and ascendant, respectively. The sun indicates the month, the moon the day, and the ascendant the “moment” of birth. The positions of sun, moon, and ascendant form the three main pillars of the horoscope. It is altogether probable that a moon conjunction should occur once, but that it should occur three times is extremely improbable (the improbability increases by the square each time), and that it should single out precisely the three main positions of the horoscope from among 47 other possibilities is something supranormal and looks like the most gorgeous falsification in favour of astrology.

[1181] These results, as simple as they are unexpected, were consistently misunderstood by the statisticians. They thought I wanted to prove something with my set of figures, whereas I only wished to give an ocular demonstration of their

“chance” nature. It is naturally a little unexpected that a set of figures, meaningless in themselves, should “arrange” a result which everybody agrees to be improbable. It seems in fact to be an instance of that possibility which Spencer-Brown has in mind when he says that “the results of the best-designed and most rigorously observed experiments in psychical research are chance results after all,” and that “the concept of chance can cover a wider natural field than we previously suspected.”³ In other words what the previous statistical view obliged us to regard as “significant,” that is, as a quasi-intentional grouping or arrangement, must be regarded equally as belonging to the realm of chance, which means nothing less than that the whole concept of probability must be revised. One can also interpret Spencer-Brown’s view as meaning that under certain circumstances the quality of “pseudo-intention” attaches to chance, or—if we wish to avoid a negative formulation—that chance can “create” meaningful arrangements that look as if a causal intention had been at work. But that is precisely what I mean by “synchronicity,” and what I wanted to demonstrate in the report on my astrological experiment. Naturally I did not embark on the experiment for the purpose of achieving, or in anticipation of, this unexpected result, which no one could have foreseen; I was only curious to find out what sort of numbers would turn up in an investigation of this kind. This wish seemed suspicious not only to certain astrologers but also to my friendly mathematical adviser, who saw fit to warn me against thinking that my maximal figures would be a proof of the astrological thesis. Neither before nor afterwards was there any thought of such proof, besides which my experiment was arranged in a way most unsuited to that purpose, as my astrological critics had already pointed out.

[1182] Since most people believe that numbers have been *invented* or thought out by man, and are therefore nothing but concepts of quantities, containing nothing that was not previously put into them by the human intellect, it was naturally very difficult for me to put my question in any other form. But it is equally possible that numbers were *found* or discovered. In that case they are not only concepts but something more—autonomous entities which somehow contain more than just quantities. Unlike concepts they are based not on any psychic assumption but on the quality of being themselves, on a “so-ness” that cannot be expressed by an intellectual concept. Under these circumstances they might easily be endowed with qualities that have still to be discovered. Also one could, as with all autonomous beings, raise the question of their behaviour; for instance one could ask what numbers do when they are intended to express something as archetypal as astrology. For astrology is the last remnant, now applied to the stars, of that fateful assemblage of gods whose numinosity can still be felt despite the critical procedures of our scientific age. In no previous age, however “superstitious,” was astrology so widespread and so highly esteemed as it is today.

[1183] I must confess that I incline to the view that numbers were as much found as invented, and that in consequence they possess a relative autonomy analogous to that of the archetypes. They would then have, in common with the latter, the quality of being pre-existent to consciousness, and hence, on occasion, of conditioning it rather than being conditioned by it. The archetypes too, as *a priori* forms of representation, are as much found as invented: they are *discovered* inasmuch as one did not know of their unconscious autonomous existence, and *invented* by the mind inasmuch as their presence was inferred from analogous representational structures. Accordingly it would seem that natural numbers must possess an archetypal character. If that is so, then not only would certain numbers have a relation to and an effect on certain archetypes, but the reverse would also be true. The first case is equivalent to number magic, but the second is equivalent to my question whether numbers, in conjunction with the numinous assemblage of gods which the horoscope represents, would show a tendency to behave in a special way.

[1184] All reasonable people, especially mathematicians, are acutely concerned with the question of what we can do by means of numbers. Only a few devote any attention to the question of what, in so far as they are autonomous, numbers do in themselves. The question sounds so absurd that one hardly dares to utter it in decent intellectual society. I could not predict what result my scandalous statistics would show. I had to wait and see. And as a matter of fact my figures behaved in so obliging a fashion that an astrologer can probably appreciate them far better than a mathematician. Owing to their excessively strict adherence to reason, mathematicians seem unable to see beyond the fact that in each separate case my result has too great a probability to prove anything about astrology. Of course it doesn't, because it was never intended to do any such thing, and I never for a moment believed that the maximum, falling each time on a moon conjunction, represented a so-called significant figure. Yet in spite of this critical attitude a number of mistakes were made in working out and computing the statistics, which all without exception contrived to bring about the most favourable possible result for astrology. As though to punish him for his well-meaning warning, the worst mistake of all fell to the lot of my mathematician, who at first calculated far too small a probability for the individual maxima, and was thus unwittingly deceived by the unconscious in the interests of astrological prestige.

[1185] Such lapses can easily be explained by a secret support for astrology in face of the violently prejudiced attitude of the conscious mind. But this explanation does not suffice in the case of the extremely significant over-all result, which with the help of quite fortuitous numbers produced the picture of the classical marriage tradition in astrology, namely the conjunction of the moon with the three principal positions of the horoscope, when there were 47 other possibilities to choose from. Tradition since the time of Ptolemy predicts that the moon conjunction with the sun or moon of the

partner is the marriage characteristic. Because of its position in the horoscope, the ascendant has just as much importance as the sun and moon. In view of this tradition one could not have wished for a better result. The figure giving the probability of this predicted concurrence, unlike the first-obtained maximum of 10%, is indeed highly significant and deserves emphasizing, although we are no more able to account for its occurrence and for its apparent meaningfulness than we can account for the results of Rhine's experiments, which prove the existence of a perception independent of the space-time barrier.

[1186] Naturally I do not think that this experiment or any other report on happenings of this kind proves anything; it merely points to something that even science can no longer overlook—namely, that its truths are in essence statistical and are therefore not absolute. Hence there is in nature a background of acausality, freedom, and meaningfulness which behaves complementarily to determinism, mechanism, and meaninglessness; and it is to be assumed that such phenomena are observable. Owing to their peculiar nature, however, they will hardly be prevailed upon to lay aside the chance character that makes them so questionable. If they did this they would no longer be what they are—acausal, undetermined, meaningful.⁴

[1187] [Pure causality is only meaningful when used for the creation and functioning of an efficient instrument or machine by an intelligence standing outside this process and independent of it. A self-running process that operates entirely by its own causality, i.e., by absolute necessity, is meaningless. One of my critics accuses me of having too rigid a conception of causality. He has obviously not considered that if cause and effect were not necessarily⁵ connected there would hardly be any meaning in speaking of causality at all. My critic makes the same mistake as the famous scientist⁶ who refuses to believe that God played dice when he created the world. He fails to see that if God did not play dice he had no choice but to create a (from the human point of view) meaningless machine. Since this question involves a transcendental judgment there can be no final answer to it, only a paradoxical one. *Meaning arises not from causality but from freedom, i.e., from acausality.*

[1188] [Modern physics has deprived causality of its axiomatic character. Thus, when we explain natural events we do so by means of an instrument which is not quite reliable. Hence an element of uncertainty always attaches to our judgment, because—*theoretically, at least*—we might always be dealing with an exception to the rule which can only be registered negatively by the statistical method. No matter how small this chance is, it nevertheless exists. Since causality is our only means of explanation and since it is only relatively valid, we explain the world by applying causality in a paradoxical way, both positively and negatively: A is the cause of B and possibly not. The negation can be omitted in the great majority of cases. But it is my contention that it cannot be omitted in the case of phenomena which are relatively

independent of space and time. As the time-factor is indispensable to the concept of causality, one cannot speak of causality in a case where the time-factor is eliminated (as in precognition). *Statistical truth leaves a gap open for acausal phenomena.* And since our causalistic explanation of nature contains the possibility of its own negation, it belongs to the category of *transcendental judgments*, which are paradoxical or antinomian. That is so because nature is still beyond us and because science gives us only an average picture of the world, but not a true one. If human society consisted of average individuals only, it would be a sad sight indeed.]

[1189] From a rational point of view an experiment like the one I conducted is completely valueless, for the oftener it is repeated the more probable becomes its lack of results. But that this is also *not* so is proved by the very old tradition, which would hardly have come about had not these “lucky hits” often happened in the past. They behave like Rhine’s results: they are exceedingly improbable, and yet they happen so persistently that they even compel us to criticize the foundations of our probability calculus, or at least its applicability to certain kinds of material.

[1190] When analysing unconscious processes I often had occasion to observe synchronistic or ESP phenomena, and I therefore turned my attention to the psychic conditions underlying them. I believe I have found that they nearly always occur in the region of archetypal constellations, that is, in situations which have either activated an archetype or were evoked by the autonomous activity of an archetype. It is these observations which led me to the idea of getting the combination of archetypes found in astrology to give a quantitatively measurable answer. In this I succeeded, as the result shows; indeed one could say that the organizing factor responded with enthusiasm to my prompting. The reader must pardon this anthropomorphism, which I know positively invites misinterpretation; it fits in excellently well with the psychological facts and aptly describes the emotional background from which synchronistic phenomena emerge.

[1191] I am aware that I ought at this point to discuss the psychology of the archetype, but this has been done so often and in such detail elsewhere⁷ that I do not wish to repeat myself now.

[1192] I am also aware of the enormous impression of improbability made by events of this kind, and that their comparative rarity does not make them any more probable. The statistical method therefore excludes them, as they do not belong to the average run of events.

LETTERS ON SYNCHRONICITY

*To Markus Fierz*¹

21 February 1950

Dear Professor Fierz,

[1193] You were kind enough to read through my MS on synchronicity, for which I have never thanked you sufficiently. I have been too engrossed in working out this idea.

[1194] Today I take the liberty of burdening you with yet another portion of this manuscript, my excuse being that I am in great perplexity as regards the mathematical evaluation of the results worked out. I enclose the Tables, together with the commentary. For your general orientation I would only remark that the peculiar nature of the material has necessitated a somewhat peculiar arrangement of the Tables. The basis of the experiment consists of 180 married pairs, whose horoscopes were compared for the frequency of the so-called classical marriage aspects, namely, the conjunction and opposition of sun and moon, Mars and Venus, ascendant and descendant. These yield 50 aspects. The results obtained for married pairs were compared with $180 \times 180 - 1 = 32,220$ combinations of unmarried pairs. To the original material of 180 married pairs another 145 were added later, which were also included in the statistics. They were examined in part separately, in part together with the 180, as you can see from the Tables.

[1195] The most interesting seems to me to be Table VI,² which shows the dispersions in the frequency values of the aspects. I would now be most grateful if you would give me your criticism and view of the Tables as a whole, and, in particular, answer a question arising out of Table VI. We have here some aspects which considerably exceed the probable mean value of the combinations. I would now like to know what is the probability of these deviations from the probable mean. I know that for this purpose a calculation is used which is based on the so-called "deviation standard."³ But this method is beyond my mathematical capacity and here I am wholly dependent on your help. I would be very glad if you would concentrate mainly on this question. For outside reasons there is some urgency with these Tables, as the book is soon to go to press. Failing all else it would be enough for me if you could simply confirm that the Tables as a whole are in order, and if you could give me the probability at least for the two highest values in Table VI, column 1. All the rest, I

devoutly hope, you will be able to see from the Tables themselves. After brooding on them for a long time they have become clear to me, and I must confess I would not know how to make them any clearer.

[1196] Should you be interested in the whole of the manuscript, or think it desirable to read it for the present purpose, it is naturally at your disposal. But I wouldn't like to send such an avalanche crashing down on you without warning.

Thanking you in advance for the trouble you are taking,

Yours sincerely, C. G. JUNG

2 March 1950

Dear Professor Fierz,

[1197] My best thanks for all the trouble you have taken. You have given me just what I hoped for from you—an objective opinion as to the significance of the statistical figures obtained from my material of now 400 marriages. Only I am amazed that my statistics have amply confirmed the traditional view that the sun-moon aspects are marriage characteristics, which is further underlined by the value you give for the moon-moon conjunction, namely 0.125%.

For myself I regard the result as very unsatisfactory and have therefore stopped collecting further material, as the approximation to the probable mean with increasing material seems to me suspicious.

[1198] Although the figure of 0.125% is still entirely within the bounds of possibility, I would nevertheless like to ask you, for the sake of clarity, whether one may regard this value as “significant” in so far as it represents a relatively low probability that coincides with the historical tradition? May one at least *conjecture* that it argues for rather than against the tradition (since Ptolemy)? I fully share your view of divinatory methods as *catalysts* of intuition. But the result of these statistics has made me somewhat sceptical, especially in connection with the latest ESP experiments which have obtained probabilities of 10^{-31} . These experiments and the whole experience of ESP are sufficient proof that meaningful coincidences do exist. There is thus some probability that the divinatory methods actually produce synchronistic phenomena. These seem to me most clearly discernible in astrology. The statistical findings undoubtedly show that the astrological correspondences are nothing more than chance. The statistical method is based on the assumption of a continuum of uniform objects. But synchronicity is a qualified individual event which is ruined by the statistical method; conversely, synchronicity abolishes the assumption of [a continuum of] uniform objects and so ruins the statistical method. It seems, therefore, that a *complementarity relationship* exists between synchronicity and causality. Rhine's statistics have proved the existence of synchronicity *in spite of unsuitable methods*. This aroused false hopes in me as regards astrology. In Rhine's experiments

the phenomenon of synchronicity is an extremely simple matter. The situation in astrology is incomparably more complicated and is therefore more sensitive to the statistical method, which emphasizes just what is least characteristic of synchronicity, that is, uniformity. Now my results, mischievously enough, exactly confirm the old tradition although they are as much due to chance as were the results in the old days. So again something has happened that shows all the signs of synchronicity, namely a “meaningful coincidence” or “Just So” story. Obviously the ancients must have experienced the same thing quite by chance, otherwise no such tradition could ever have arisen. I don’t believe any ancient astrologer statistically examined 800 horoscopes for marriage characteristics. He always had only small batches at his disposal, which did not ruin the synchronistic phenomenon and could therefore, as in my case, establish the prevalence of moon-moon and moon-sun conjunctions, although these are bound to diminish with a higher range of numbers. All synchronistic phenomena, which are more highly qualified than ESP, are as such unprovable, that is to say a single authenticated instance is sufficient proof in principle, just as one does not need to produce ten thousand duckbilled platypi in order to prove they exist. It seems to me synchronicity represents a *direct act of creation* which manifests itself as chance. The statistical proof of natural conformity to law is therefore only a very limited way of describing nature, since it grasps only uniform events. But nature is essentially discontinuous, i.e., subject to chance. To describe it we need a principle of discontinuity. In psychology this is the drive to individuation, in biology it is differentiation, but in nature it is the “meaningful coincidence,” that is to say synchronicity.

[1199] Forgive me for putting forward these somewhat abstruse-looking reflections. They are new to me too and for that reason are still rather chaotic like everything *in statu nascendi*.

Thanks again for your trouble! I should be glad to have your impressions.

Best regards, C. G. JUNG

20 October 1954

Dear Professor Fierz,

[1200] Just now an English version of my book on synchronicity is being prepared. I would like to take this opportunity to make the necessary corrections for the probabilities of the maximal figures which you have so kindly calculated for me. My publishers now want to see the details of your calculation, as they don’t understand what method you have employed. If it would be possible for you to let me have this report fairly soon I should be most grateful. Unfortunately I must still add a special request, namely the answer to the question: What is the probability of the total result that the 3 conjunctions, moon-sun, moon-moon, moon asc., all come out together?⁴

This result (though consisting of chance figures) corresponds to the traditional astrological prediction and at least *imitates* that picture, and if it consisted of “significant figures” would prove the rightness of astrological expectations.

[1201] I hope I have succeeded in expressing myself clearly. I am indeed extremely sorry to bother you with this question and take up your valuable time. Perhaps you can assign the task to a student. Naturally in this matter I am helpless and am therefore quite prepared to recompense you or the student for the expenses involved. Please do not be offended at this practical suggestion.

Best thanks in advance!

Yours sincerely, C. G. JUNG

28 October 1954

Dear Professor Fierz,

[1202] Let me thank you most cordially for your kind and prompt fulfilment of my request. There is, of course no need for you to repeat your exposition; I will send it direct to Dr. Michael Fordham.

[1203] A misunderstanding seems to have arisen over my question about the moon-sun, moon-moon, moon-asc. triad:

1. The fact that my figures are due to chance was something I myself had noticed when putting my tables together. That is why I had the Tables printed in full; they express the chance nature of the figures quite clearly and so enable the non-mathematical reader to take it in at a glance. For the sake of accuracy I then asked you to give me the probability of my maxima. Your answer is more or less in line with what I expected. It was never my intention to prove that the astrological prediction is correct—I know the unreliability of astrology much too well for that. I only wanted to find out the exact degree of probability of my figures. You have already warned me twice about the impossibility of proving anything. That, if you will permit me to say so, is carrying coals to Newcastle. It doesn't matter to me at all whether astrology is right or not, but only (as said) what degree of probability those figures (“maxima”) have, which *simulate* an apparent proof of the rightness of the astrological prediction.

2. The astrological prediction consists in the *traditional* assertion that my three moon conjunctions are specifically characteristic of marriage. (Sun, moon, asc. are the main pillars of the horoscope.) So this triad is not arbitrarily selected at all, for which reason I consider the analogy of the three white ants⁵ entirely to the point. With all due respect, you seem to me to go very wide of the mark if you imagine that I regard my results as other than statistically determined. Naturally they fall within the limits of mathematical probability, but that does not stop my maxima from occurring at the very places the astrologer would expect. The only thing that interests

me is the degree of probability to be attributed to this coincidence, merely for the sake of accuracy! I don't want to *prove* anything with my figures but only to *show what has happened* and what I have done. *Quite by chance*, as I have tried to show with all possible clarity, a configuration resulted which, if it consisted of significant figures, would argue in favour of astrology. The whole story is in other words a case like the scarab⁶ and simply shows what chance can do—a “Just So” story in fact! That such coincidences are in principle more than merely statistically determined is proved by Rhine's results, but not by an isolated instance like my statistics.

[1204] Naturally I speak in favour of chance in one respect, because I contest the absolute validity of statistical statements in so far as they dismiss all exceptions as unimportant. This gives us an abstract, average picture of reality which is to some extent a falsification of it, and this cannot remain a matter of indifference to the psychologist since he has to cope with the pathological consequences of this abstract substitute for reality.

[1205] The exception is actually more real than the average since it is the vehicle of reality *par excellence*, as you yourself point out in your letter of October 24th.

[1206] I am sorry to have caused you so much work, and that you now have to read this long letter as well. But I really do not know what could have led you to believe that I wanted to prove the truth of astrology. I only wanted to present a case of “meaningful coincidence” which would illustrate the main idea of my paper on synchronicity. This fact has been generally overlooked. In London they have called in a top statistician⁷ to solve the riddle of my Tables. That is rather like a peasant not being able to open his barn door and then sending for an expert on safes, who naturally can't open it either. Regrettably, he too has succumbed to the error that I wanted to prove something in favour of astrology, although I disclaim this at some length in my book.

[1207] Unfortunately I am unable to understand how you can consider any other constellations (among my 50) just as “meaningful” as the three moon conjunctions. None of the others are “classical predictions.” Nor does just any ant appear, but only the “predicted” white ant. I am interested to know the probability of this meaningful occurrence precisely because it is not very probable that the white ant will be the first to come out of the box three times in succession. If the probability of a single time is 1:50, wouldn't the probability of three times be 1:50³? A quite appreciable figure, it seems to me. This result may surely be taken as complying with my intention to present a case of synchronicity, even though it proves nothing about astrology, which was never my intention anyway.

Hoping that I have succeeded this time in clearing up the misunderstanding,
I remain with best thanks and cordial greetings,

Yours, C. G. JUNG

1st July 1955

Dear Fordham,

[1208] Synchronicity tells us something about the nature of what I call the *psychoid* factor, i.e., the unconscious archetype (not its conscious representation!). As the archetype has the tendency to gather suitable forms of expression round itself, its nature is best understood when one imitates and supports this tendency through amplification. The natural effect of an archetype and its amplification can be certainly understood as an analogy of the synchronistic effect, inasmuch as the latter shows the same tendency of arranging collateral and coincidental facts which represent suitable expressions of the underlying archetype. It is difficult or even impossible, however, to prove that amplificatory associations are *not causal*, whereas amplificatory facts coincide in a way that defies causal explanation. That is the reason why I call spontaneous and artificial amplification a mere analogy of synchronicity. It is true, however, that we cannot prove a causal connection in every case of amplification, and thus it is quite possible that in a number of cases, where we assume causal “association,” it is really a matter of synchronicity. What is “association” after all? We don’t know. It is not impossible that psychic arrangement in general is based upon synchronicity with the exception of the secondary rational “enchaînement” of psychic events in consciousness. This is analogous to the natural course of events, so different from our scientific and abstract reconstruction of reality based upon the statistical average. The latter produces a picture of nature consisting of mere probabilities, whereas reality is a crisscross of more or less impracticable events. Our psychic life shows the same phenomenological picture. This is the reason why I am rather inclined to think that it would be presumptuous to suppose the psyche is based exclusively upon the synchronistic principle, at least in our present state of knowledge.

[1209] I quite agree with your idea of the two complementary attitudes of understanding, viz., rational and irrational or synchronistic. But it remains to be seen whether all irrational events are *meaningful coincidences*. I doubt it.

[1210] It is refreshing to see you at work with these interesting problems and to hear something intelligent from you instead of the amazing stupidities dished out by our contemporaries.

[1211] I am sorry that I cannot come over to England to celebrate with you. I am writing in hospital, where I am nursing some prostatic trouble. Tomorrow I shall be dismissed for the time being. Old age is not exactly my idea of a joke.

My best wishes, Yours cordially, C. G. JUNG

[1212] P.S. As you are going to celebrate my 80th birthday in London and I am unfortunately unable to attend I thought it might be a nice gesture if you could send an invitation to the Swiss Ambassador to Great Britain. I am sure that he would appreciate at least your friendly gesture to one of his countrymen.

THE FUTURE OF PARAPSYCHOLOGY

The *International Journal of Parapsychology* (New York), in its 1963 autumn issue (V:4, pp. 450f.), published Jung's answers to a questionnaire which had been circulated in June 1960 among various authorities in connection with a survey on "The Future of Parapsychology."

How do you define parapsychology?

[1213] Parapsychology is the science dealing with those biological or psychological events which show that the categories of matter, space, and time (and thus of causality) are not axiomatic.

Which areas of research, in your opinion, should be classified as belonging within parapsychology?

[1214] The psychology of the unconscious.

Do you anticipate that future research would emphasize quantitative or qualitative work?

[1215] Future research will have to emphasize both.

Do you believe that a repeatable experiment is essential to strengthen the position of parapsychological studies within the scientific community?

[1216] The repeatable experiment is desirable but, inasmuch as most of the events are spontaneous and irregular, the experimental method will not be generally applicable.

Have you any comments on recent criticisms with regard to statistical methods employed in parapsychological studies?

[1217] The statistical method is most desirable and indispensable to scientific research, where and when it can be applied. But this is only possible when the material shows a certain regularity and comparability.

Do you believe that certain qualitative researches may be quantified in order to gain wider acceptance?

[1218] The quantification of qualitative research is surely the best means of conviction.

In the qualitative area, where do you foresee the greatest potential for future research progress—spontaneous phenomena, crisis telepathy, survival studies, out-of-the-body experiences, or any other?

[1219] The greatest and most important part of parapsychological research will be the careful exploration and qualitative description of spontaneous events.

Do you feel that during the past decade parapsychology has become more widely accepted among scientists active in other areas?

[1220] My impression is that, in Europe, at least, open-mindedness has increased.

Have you any comments regarding the psychological significance of certain psychic phenomena?

[1221] The psychological significance of parapsychological events has hardly been explored yet.

Have you any comments regarding the special psychological conditions that seem to favour, or reduce, the likelihood of an occurrence of psychic phenomena?

[1222] The factor which favours the occurrence of parapsychological events is the presence of an active archetype, i.e., a situation in which the deeper, instinctual layers of the psyche are called into action. The archetype is a borderline phenomenon, characterized by a relativation of space and time, as already pointed out by Albertus Magnus (*De mirabilibus mundi*),¹ whom I have mentioned in my paper "Synchronicity: An Acausal Connecting Principle."

THE ARCHETYPES AND THE COLLECTIVE UNCONSCIOUS

(related to Volume 9 of the Collected Works)

THE HYPOTHESIS OF THE COLLECTIVE UNCONSCIOUS¹

[1223] Indications of the concept of a collective psyche are to be found in Leibniz's theory of "petites perceptions," also in Kant's anthropology. In Schelling the "eternally unconscious" is the absolute ground of consciousness. Despite different terminology Hegel's view is similar. C. G. Carus was the first to base a developed philosophical system on the concept of the unconscious. Related features may be found in Schopenhauer. Eduard von Hartmann exalted the unconscious to the concept of an absolute, universal Spirit. The scientific investigation of the psychological unconscious began with the discovery of hypnotism and was continued via the Salpêtrière school in the works of Janet and Flournoy. Independently of this, it was the Breuer-Freud discovery of the aetiology of neurosis that led to Freud's sexual theory of the unconscious. Independent, again, of the Freudian school was the discovery of the so-called "complexes" and "autonomous contents" of the unconscious by the author.

[1224] Whereas for Freud the unconscious is essentially a function of consciousness, the author holds the unconscious to be an independent psychic function prior to consciousness and opposed to it. According to this view the unconscious may be divided into a *personal* and a *collective* unconscious. The latter is a psychic propensity to a regular functioning, independent of time and race. Its products may be compared with "mythological motifs." Despite the autochthonous origin of the former, the two are analogous in principle, which may be taken as an indication of their conforming to psychological law.

[1225] In the further course of the lecture the author, with the help of a special department of symbology, the so-called mandala symbolism, demonstrated the parallelism between the symbol of the circle, as produced by educated patients undergoing treatment, and the ritual mandalas of lamaism and *kundalini* yoga, as well as the parallels with the views of the Tantrists, of classical Chinese philosophy, and Chinese yoga. Further parallels are children's drawings, the prehistoric mandalas of Rhodesia, the sand-paintings from the healing ceremonies (*yaibichy* dances) of the Navaho (Arizona),² the visions of Hildegard of Bingen from the Codex Lucca³ (12th to 13th cent.), and the eschatological views of Jacob Boehme.⁴ The modern pictorial material was derived from people who produced it spontaneously and were not in any way influenced.

FOREWORD TO ADLER: "ENTDECKUNG DER SEELE"¹

[1226] This book is a systematic account of the three different approaches now current in psychotherapy: Freud's, Alfred Adler's, and my own. Drawing on his wide professional knowledge, the author has carefully elaborated the principal viewpoints underlying each approach, and thus gives the reader, who may have neither the time nor the opportunity to study the originals, a complete and rigorously objective survey of this controversial field. The exposition and manner of expression are such that the educated layman can follow the argument without difficulty.

[1227] Psychological theories, which at the outset seemed destined for use only in the strictly delimited domain of medical psychotherapy, have long since burst the bounds of a specialized science, and have not only penetrated into the provinces of its sister sciences but become—even if fragmentary—the common property of all educated persons. This means, however, that informed public opinion has been infected with the same confusion which still prevails today in medical psychology. What distinguishes Dr. Adler's work in particular is his thoroughly reliable and comprehensive account of my own views, which differ in so radical and characteristic a way from those of the other two investigators. His book, sober, lucid, and systematic, is a worthy companion to the earlier works by Kranefeldt² and Heyer.³ It is a milestone in the slow but sure conquest of the crises and confusions that hang over the psychological views of our day.

December 1933

FOREWORD TO HARDING: "WOMAN'S MYSTERIES"¹

[1228] Esther Harding, the author of this book, is a physician and specialist in the treatment of psychogenic illness. She is a former pupil of mine who has endeavoured not only to understand the modern psyche but also, as the present book shows, to explore its historical background. Preoccupation with historical subjects may at first glance seem to be merely a physician's personal hobby, but to the psychotherapist it is a necessary part of his mental equipment. The psychology of primitives, folklore, mythology, and the science of comparative religion open our eyes to the wide horizons of the human psyche and give us that indispensable aid we so urgently need for an understanding of unconscious processes. Only when we see in what shape and what guise dream symbols, which seem to us unique, appear on the historical and ethnic scene, can we really understand what they are pointing at. Also, once equipped with this extensive comparative material, we can comprehend more nearly that factor which is so decisive for psychic life, the archetype. Of course this term is not meant to denote an inherited idea, but rather an inherited mode of psychic functioning, corresponding to the inborn way in which the chick emerges from the egg, the bird builds its nest, a certain kind of wasp stings the motor ganglion of the caterpillar, and eels find their way to the Bermudas. In other words, it is a "pattern of behaviour." This aspect of the archetype, the purely biological one, is the proper concern of scientific psychology.

[1229] But the picture changes at once when looked at from the inside, from within the realm of the subjective psyche. Here the archetype appears as a numinous factor, as an experience of fundamental significance. Whenever it clothes itself in suitable symbols (which is not always the case), it seizes hold of the individual in a startling way, creating a condition amounting almost to possession, the consequences of which may be incalculable. It is for this reason that the archetype is so important in the psychology of religion. All religious and metaphysical concepts rest upon archetypal foundations, and, to the extent that we are able to explore them, we can cast at least a superficial glance behind the scenes of world history, and lift a little the veil of mystery which hides the meaning of metaphysical ideas. Metaphysics is, as it were, a physics or physiology of the archetypes, and its dogmas formulate the insights that have been gained into the nature of these dominants—the unconscious leitmotifs that characterize the psychic happenings of a given epoch. The archetype is "metaphysical" because it transcends consciousness.

[1230] Dr. Harding's book is an attempt to describe some of the archetypal foundations of feminine psychology. In order to understand the author's intention, the reader must overcome the prejudice that psychology consists merely of what Mr. Smith and Mrs. Jones happen to know about it. The psyche consists not only of the contents of consciousness, which derive from sensory impressions, but also of ideas apparently based on perceptions which have been modified in a peculiar way by preexistent and unconscious formative factors, i.e., by the archetypes. The psyche can therefore be said to consist of consciousness plus the unconscious. This leads us to conclude that one part of the psyche is explicable in terms of recent causes, but that another part reaches back into the deepest layers of our racial history.

[1231] Now the one certain fact about the nature of neurosis is that it is due to a disturbance of the primary instincts, or at least affects the instincts to a considerable degree. The evolution of human anatomy and of human instincts extends over geological periods of time. Our historical knowledge throws light upon only a few stretches of the way, whose total length would have to be reckoned in millions of miles. However, even that little bit is a help when, as psychotherapists, we are called upon to remedy a disturbance in the sphere of instinct. Here it is the therapeutic myths offered by religion that teach us the most. The religions might indeed be considered as psychotherapeutic systems which assist our understanding of instinctual disturbances, for these are not a recent phenomenon but have existed from time immemorial. Although certain types of disease, notably infectious ones like *typhus antiquorum*, may disappear and others take their place, it is still not very probable that tuberculosis, shall we say, was an entirely different disease five or ten thousand years ago. The same is true of psychic processes. Therefore, in the descriptions of abnormal psychic states left us by antiquity, we are able to recognize certain features that are familiar to us; and when it comes to the fantasies of neurotic and psychotic patients, it is just here, in ancient literature, that we find the most illuminating parallels.

[1232] From the empirical evidence, it has now been known for some time that any one-sidedness of the conscious mind, or a disturbance of the psychic equilibrium, elicits a compensation from the unconscious. The compensation is brought about by the constellation and accentuation of complementary material which assumes archetypal forms when the *fonction du réel*, or correct relation to the surrounding world, is disturbed. When, for instance, a woman develops too masculine an attitude—something that may very easily happen owing to the social emancipation of women today—the unconscious compensates this one-sidedness by a symptomatic accentuation of certain feminine traits. This process of compensation takes place within the personal sphere so long as the vital interests of the personality have not been harmed. But if more profound disturbances should occur, as when a women

alienates herself from her husband through her insistence on always being in the right, then archetypal figures appear on the scene. Difficulties of this kind are very common, and once they have grown to pathological proportions they can be remedied only by psychotherapeutic methods. For this reason, it has long been the endeavour of analytical psychologists to acquire as wide a knowledge as possible of the network of archetypal images produced by the unconscious, with a view to understanding the nature of the archetypal compensation in each individual case.

[1233] Dr. Harding's systematic survey of the archetypal material of feminine compensation comes as a most welcome contribution to these endeavours, and we must be grateful to her for having devoted herself to this task with such self-sacrificing effort in addition to her professional work. Her investigation is valuable and important not only for the specialist but for the educated layman who is interested in a psychology founded on experience of life and a knowledge of human nature. Our times, characterized as they are by an almost total disorientation in regard to the ends of human existence, stand in need, above all else, of a vast amount of psychological knowledge.

August 1948

FOREWORD TO NEUMANN: "THE ORIGINS AND HISTORY OF CONSCIOUSNESS"¹

[1234] The author has requested me to preface his book with a few words of introduction, and to this I accede all the more readily because I found his work more than usually welcome. It begins just where I, too, if I were granted a second lease of life, would start to gather up the *disjecta membra* of my own writings, to sift out all those "beginnings without continuations" and knead them into a whole. As I read through the manuscript of this book it became clear to me how great are the disadvantages of pioneer work: one stumbles through unknown regions; one is led astray by analogies, forever losing the Ariadne thread; one is overwhelmed by new impressions and new possibilities; and the worst disadvantage of all is that the pioneer only knows afterwards what he should have known before. The second generation has the advantage of a clearer, if still incomplete, picture; certain landmarks that at least lie on the frontiers of the essential have grown familiar, and one now knows what must be known if one is to explore the newly discovered territory. Thus forewarned and forearmed, a representative of the second generation can spot the most distant connections; he can unravel problems and give a coherent account of the whole field of study, whose full extent the pioneer can only survey at the end of his life's work.

[1235] This difficult and meritorious task the author has performed with outstanding success. He has woven his facts into a pattern and created a unified whole, which no pioneer could have done nor could ever have attempted to do. As though in confirmation of this, the present work opens at the very place where I unwittingly made landfall on the new continent long ago, namely, the realm of *matriarchal symbolism*; and, as a conceptual framework for his discoveries, the author uses a symbol whose significance first dawned on me in my recent writings on the psychology of alchemy: the *uroboros*. Upon this foundation he has succeeded in constructing a unique history of the evolution of consciousness, and at the same time is representing the body of myths as the phenomenology of this same evolution. In this way he arrives at conclusions and insights which are among the most important ever to be reached in this field.

[1236] Naturally to me, as a psychologist, the most valuable aspect of the work is the fundamental contribution it makes to a psychology of the unconscious. The author has placed the concepts of analytical psychology—which for many people are so bewildering—on a firm evolutionary basis, and erected upon this a comprehensive

structure in which the empirical forms of thought find their rightful place. No system can ever dispense with an over-all hypothesis which in its turn depends upon the temperament and subjective assumptions of the author as well as upon objective data. This factor is of the greatest importance in psychology, for the “personal equation” colours the mode of seeing. Ultimate truth, if there be such a thing, demands the concert of many voices.

[1237] I can only congratulate the author on his achievement. May this brief foreword convey to him my heartfelt thanks.

1 March 1949

FOREWORD TO ADLER: "STUDIES IN ANALYTICAL PSYCHOLOGY"¹

[1238] It gave me particular pleasure to hear that Dr. Gerhard Adler's admirable book *Studies in Analytical Psychology* is now to appear in German. The author is a skilled psychotherapist and therefore in a position to handle his theme on the basis of practical experience. This advantage can hardly be overrated, for therapeutic work means not only the daily application of psychological views and methods to living people and to sick people in particular, but also a daily criticism which success or failure brings to bear upon the therapy and its underlying assumptions. We may therefore expect from the author a well-pondered judgment amply backed by experience. In this expectation we are not disappointed. Everywhere in these essays we come across nicely balanced opinions and never upon prejudices, bigotries, or forced interpretations.

[1239] With a happy choice the author has picked out a number of problems which must inevitably engage the attention of every thinking psychotherapist. First and foremost he has been concerned—very understandably—to stress the peculiarity of analytical psychology as compared with the materialistic and rationalistic tendencies of the Freudian school—an undertaking which, in view of the latter's delight in sectarian seclusion, has still lost nothing of its topicality. This is by no means a matter of specialist or merely captious differences that would not interest a wider public; it is more a matter of principle. A psychology that wants to be scientific can no longer afford to base itself on so-called philosophical premises such as materialism or rationalism. If it is not to overstep its competence irresponsibly, it can only proceed phenomenologically and abandon preconceived opinions. But the opinion that we can pass transcendental judgments, even when faced with highly complicated material like that presented by psychological experience, is so ingrown that philosophical statements are still imputed to analytical psychology, although this is completely to misunderstand its phenomenological standpoint.

[1240] A major interest of psychotherapy is, for practical reasons, the psychology of dreams, a field where theoretical assumptions have not only suffered the greatest defeats but are applied at their most odious. The dream analysis in the third essay is exemplary.

[1241] It is much to be welcomed that the author pays due attention to the important role of the ego. He thus counters the common prejudice that analytical psychology is only interested in the unconscious, and at the same time he gives instructive examples of the relations between the unconscious and the ego in general.

[1242] The controversial question of whether, and if so how, the raising to consciousness of unconscious contents is therapeutically effective meets with adequate treatment. Although their conscious realization is a curative factor of prime importance, it is by no means the only one. Besides the initial “confession” and the emotional “abreaction” we have also to consider transference and symbolization. The present volume gives excellent illustrations of the latter two from case histories.

[1243] It is much to the credit of the author that he has also turned to the religious aspect of psychic phenomena. This question is not only delicate—it is particularly apt to irritate philosophical susceptibilities. But, provided that people are able to read and to give up their prepossessions, I truly have no idea how anybody could feel himself affronted by the author’s remarks—provided, again, that the reader is able to understand the phenomenological viewpoint of science. Unhappily this understanding, as I often had occasion to know, does not appear to be particularly widespread—least of all, it would seem, in professional medical circles. The theory of knowledge does not of course figure in the medical curriculum, but is indispensable to the study of psychology.

[1244] Not only on account of the lucidity of its exposition, but also because of its wealth of illustrative case histories, this book fills a gap in psychological literature. It gives both the professional and the psychologically minded layman a welcome set of bearings in territory which—at any rate to begin with—most people find rather hard of access. But the examples drawn direct from life offer an equally direct approach, and this is an aid to understanding. I would therefore like to recommend this book most cordially to the reading public.

May 1949

FOREWORD TO JUNG: "GESTALTUNGEN DES UNBEWUSSTEN" (1950)¹

[1245] In so far as poetry is one of those psychic activities that give shape to the contents of the unconscious, it seems to me not unfitting to open this volume with an essay which is concerned with a number of fundamental questions affecting the poet and his work.^{1a} This discussion is followed by a lecture on the rebirth motif,² given on the occasion of a symposium on this theme. Drama, the principal theme of poetic art, had its origin in ceremonial, magically effective rites which, in form and meaning, represented a *δρωμένον* or *δράμα*, something "acted" or "done." During this time the tension builds up until it culminates in a *περπέτεια*, the *dénouement*, and is resolved. Menacingly, the span of life narrows down to the fear of death, and out of this *angustiae* (straits, quandary, wretchedness, distress) a new birth emerges, redemptive and opening on to larger horizons. It is evident that drama is a reflection of an eminently psychological situation which, infinitely varied, repeats itself in human life and is both the expression and the cause of a universally disseminated archetype clothed in multitudinous forms.

[1246] The third contribution is a case history.³ It is the description of a process of transformation illustrated by pictures. This study is supplemented by a survey of mandala symbolism drawn from case material.⁴ The interpretation of these pictures is in the main formal and, unlike the preceding essay, lays more emphasis on the common denominators in the pictures than on their individual psychology.

[1247] The fifth and last contribution is a psychological study of E.T.A. Hoffmann's tale "The Golden Pot," by Aniela Jaffé.⁵ This tale of Hoffmann's has long been on my list of literary creations which cry out for interpretation and deeper understanding. I am greatly indebted to Mrs. Jaffé for having undertaken the not inconsiderable labour of investigating the psychological background of "The Golden Pot," thus absolving me from a task which I felt to be an obligation.

January 1949

FOREWORD TO WICKES: "VON DER INNEREN WELT DES MENSCHEN"¹

[1248] Frances G. Wickes' book, which first appeared in America in 1938,² is now available in a German translation. It is the fruit of a long and industrious life, uncommonly rich in experience of people of all classes and ages. Anyone who wishes to form a picture of the inner life of the psyche and broaden his knowledge of psychic phenomena in general is warmly recommended to read this book. The author has taken the greatest pains to express the inner experiences of her patients with the help of the viewpoints I have introduced into psychology. Her collection of case histories is of the greatest value to the skilled psychotherapist and practising psychologist, not to mention the layman, for whom she opens vistas into a world of experience hitherto inaccessible to him.

[1249] If, as in this book, fantasy is taken for what it is—a natural expression of life which we can at most seek to understand but cannot correct—it will yield possibilities of psychic development that are of the utmost importance for the cure of psychogenic neuroses and of the milder psychotic disturbances. Fantasies should not be negatively valued by subjecting them to rationalistic prejudices; they also have a positive aspect as creative compensations of the conscious attitude, which is always in danger of incompleteness and one-sidedness. Fantasy is a self-justifying biological function, and the question of its practical use arises only when it has to be channeled into so-called concrete reality. So long as this situation has not arisen, it is completely beside the point to explain fantasy in terms of some preconceived theory and to declare it invalid, or to reduce it to some other biological process. Fantasy is the natural life of the psyche, which at the same time harbours in itself the irrational creative factor. The neurotic's involuntary over- or undervaluation of fantasy is as injurious to the life of the psyche as its rationalistic condemnation or suppression, for fantasy is not a sickness but a natural and vital activity which helps the seeds of psychic development to grow. Frances Wickes illustrates this in exemplary fashion by describing the typical figures and phases that are encountered in involuntary fantasy processes.

September 1953

FOREWORD TO JUNG: "VON DEN WURZELN DES BEWUSSTSEINS" (1954)¹

[1250] In this ninth volume of the "Psychologische Abhandlungen" I have put together a number of works which for the most part grew out of Eranos lectures. Some have been revised, some augmented, and some completely reworked. The essay on "The Philosophical Tree" is new, although I have dealt with this theme earlier in a sketchy way. The central theme of this book is the *archetype*, the nature and significance of which are described and elucidated from various angles: history, psychology both practical and theoretical, case material. In spite of the fact that this theme has often been discussed by me as well as by other authors, such as Heinrich Zimmer, Karl Kerényi, Erich Neumann, Mircea Eliade, etc., it has proved to be both inexhaustible and particularly difficult to comprehend, if one may give credence to criticisms vitiated by prejudice and misunderstanding. One is left with the suspicion that the psychological standpoint and its consequences are felt in many quarters to be disagreeable and for this reason are not permitted a hearing. The simplistic approach is instantly assured of the applause of the public because it pretends to make the answering of difficult questions superfluous, but well-founded observations that cast doubt on things which appear simple and settled arouse displeasure. The theory of archetypes seems to come into this category. For some it is self-evident and a welcome aid in understanding symbol-formation, individual as well as historical and collective. For others it seems to epitomize an annoying aberration that has to be extirpated by all possible means, however ridiculous.

[1251] Although it is easy to demonstrate the existence and efficacy of the archetypes, their phenomenology leads to really difficult questions of which I have given a few samples in this book. For the present there is still no possibility of simplification and of building highways "that fools may not err."

May 1953

FOREWORD TO VAN HELSDINGEN: "BEELDEN UIT HET ONBEWUSTE"¹

[1252] Dr. R. J. van Helsdingen has asked me to write a foreword to his book. I am happy to comply with his request for a particular reason: the case that is discussed and commented on was one that I treated many years ago, as can now be said publicly with the kind permission of my former patient. Such liberality is not encountered everywhere, because many one-time patients are understandably shy about exposing their intimate, tormenting, pathogenic problems to the eye of the public. And indeed one must admit that their drawings or paintings do not as a rule have anything that would recommend them to the aesthetic needs of the public at large. If only for technical reasons the pictures are usually unpleasant to look at and, lacking artistic power, have little expressive value for outsiders. These shortcomings are happily absent in the present case: the pictures are artistic compositions in the positive sense and are uncommonly expressive. They communicate their frightening, daemonic content to the beholder and convince him of the terrors of a fantastic underworld.

[1253] While it was the patient's own mother country that produced the great masters of the monstrous, Hieronymus Bosch and others, who opened the flood-gates of creative fantasy, the pictures in this book show us imaginative activity unleashed in another form: the Indomalaysian phantasmagoria of pullulating vegetation and of fear-haunted, stifling tropical nights. Environment and inner disposition conspired to produce this series of pictures which give expression to an infantile-archaic fear. Partly it is the fear of a child who, deprived of her parents, is defencelessly exposed to the unconscious and its menacing, phantasmal figures; partly the fear of a European who can find no other attitude to everything that the East conjures up in her save that of rejection and repression. Because the European does not know his own unconscious, he does not understand the East and projects into it everything he fears and despises in himself.

[1254] For a sensitive child it is a veritable catastrophe to be removed from her parents and sent to Europe after the unconscious influence of the Oriental world had moulded her relation to the instincts, and then, at the critical period of puberty, to be transported back to the East, when this development had been interrupted by Western education and crippled by neglect.² The pictures not only illustrate the phase of treatment that brought the contents of her neurosis to consciousness, they were also an instrument of treatment, as they reduced the half conscious or unconscious images floating about in her mind to a common denominator and fixated them. Once an

expression of this kind has been found, it proves its “magical” efficacy by putting a spell, as it were, on the content so represented and making it relatively innocuous. The more complex this content is, the more pictures are needed to depotentiate it. The therapeutic effect of this technique consists in inducing the conscious mind to collaborate with the unconscious, the latter being integrated in the process. In this way the neurotic dissociation is gradually remedied.

[1255] The author is to be congratulated on having edited this valuable and unusual material. Although only the initial stages of the analysis are presented here, some of the pictures indicate possibilities of a further development. Even with these limitations, however, the case offers a considerable enrichment of the literature on the subject, which is still very meagre.

May 1954

FOREWORD TO JACOBI: "COMPLEX/ARCHETYPE/SYMBOL"¹

[1256] The problem this book is concerned with is one in which I, too, have been interested for a long time. It is now exactly fifty years since I learned, thanks to the association experiment, the role which complexes play in our conscious life. The thing that most impressed me was the peculiar autonomy the complexes display as compared with the other contents of consciousness. Whereas the latter are under the control of the will, coming or going at its command, complexes either force themselves on our consciousness by breaking through its inhibiting effect, or else, just as suddenly, they obstinately resist our conscious intention to reproduce them. Complexes have not only an obsessive, but very often a possessive, character, behaving like imps and giving rise to all sorts of annoying, ridiculous, and revealing actions, slips of the tongue, and falsifications of memory and judgment. They cut across the adapted performance of consciousness.

[1257] It was not difficult to see that while complexes owe their relative autonomy to their emotional nature, their expression is always dependent on a network of associations grouped round a centre charged with affect. The central emotion generally proved to be individually acquired, and therefore an exclusively personal matter. Increasing experience showed, however, that the complexes are not infinitely variable, but mostly belong to definite categories, which soon began to acquire their popular, and by now hackneyed, names—inferiority complex, power complex, father complex, mother complex, anxiety complex, and all the rest. This fact, that there are well-characterized and easily recognizable types of complex, suggests that they rest on equally typical foundations, that is, on emotional aptitudes or *instincts*. In human beings instincts express themselves in the form of unreflected, involuntary fantasy images, attitudes, and actions, which bear an inner resemblance to one another and yet are identical with the instinctive reactions specific of *Homo sapiens*. They have a dynamic and a formal aspect. Their formal aspect expresses itself, among other things, in fantasy images that are surprisingly alike and can be found practically everywhere at all epochs, as might have been expected. Like the instincts, these images have a relatively autonomous character; that is to say, they are “numinous” and can be found above all in the realm of numinous or religious ideas.

[1258] For reasons that I cannot enter into here, I have chosen the term “archetype” for this formal aspect of the instinct. Dr. Jacobi has made it her task, in this book, to expound the important connection on the one hand between the individual complex and the universal, instinctual archetype, and on the other hand between this and the

symbol. The appearance of her study is the more welcome to me in that the concept of the archetype has given rise to the greatest misunderstandings and—if one may judge by the adverse criticisms—must be presumed to be very difficult to comprehend. Anyone, therefore, who has misgivings on this score can seek information in this volume, which also takes account of much of the literature. My critics, with but few exceptions, usually do not take the trouble to read over what I have to say on the subject, but impute to me, among other things, the opinion that the archetype is an inherited idea. Prejudices seem to be more convenient than seeking the truth. In this respect, too, I hope that the author's endeavours, especially the theoretical considerations contained in [Part I](#), illustrated by examples of the archetype's mode of manifestation and operation in [Part II](#), may shed a little illumination. I am grateful to her for having spared me the labour of having constantly to refer my readers to my own writings.

February 1956

FOREWORD TO BERTINE: "HUMAN RELATIONSHIPS"¹

[1259] The author of this book has undertaken the important task of investigating the problems of human relationship from the standpoint of analytical psychology, an undertaking which will be welcome not only to the psychotherapist but also to those interested in the wider field of general psychology. Facts that are of the greatest significance for an understanding of human relationships have undoubtedly come to light in the course of my own and my colleagues' researches. While the conclusions which Freud and Adler had drawn from their intensive studies of neurosis were based on the personal psychology of their neurotic patients, which they tried to apply to the psychology of society, analytical psychology has called attention to more general human facts which also play an important role in neurosis but are not specifically characteristic of it, being a normal part of the human constitution. I would mention in particular the existence of differences in type, such as extraversion and introversion, which are not difficult for a layman to recognize. It is obvious that these two diametrically opposed attitudes must have a very decisive influence on the relationship of individuals, and the psychology of the function types—thinking, feeling, sensation, and intuition—further differentiates the general effects of extraversion and introversion.

[1260] These attitude and function types belong mainly to man's conscious psychology. The researches of analytical psychology have shown, further, that it is not only the data of the senses and unconscious personal repressions which exert an influence of consciousness. It is also profoundly affected by unconscious, instinctive—that is, innate—patterns of psychic behaviour. These patterns are just as characteristic of man as are the instincts in the behaviour of animals. But while we know about the instinctive patterns in animals only by observing their outward behaviour, the human psyche offers a great advantage in that—thanks to ideas and language—the instinctive process can be visualized in the form of fantasy images, and this inner perception can be communicated to an outside observer by means of speech. If the animal psyche were capable of such an accomplishment, we would be able to recognize the mythology which the weaver bird is expressing when it builds its nest, and the yucca moth when it deposits its eggs in the yucca flower.² That is, we would know what kind of fantasy images trigger off their instinctive actions. This insight, however, is possible only in the case of human beings, where it opens up the boundless world of myth and folklore that spans the globe with analogies and parallel

motifs. The images which appear here conform with those in dreams and hallucinations to an astonishing degree, to say the least.

[1261] This discovery was actually made by Freud, and he erected a monument to it in his concept of the Oedipus complex. He was gripped by the numinosity of this motif, or archetype, and accordingly gave it a central place in his theory-building. But he failed to draw the further and inescapable conclusion that there must be another, “normal” unconscious beyond the one produced by arbitrary repressions. This “normal” unconscious consists of what Freud described as “archaic remnants.” But if the Oedipus complex represents a universal type of instinctive behaviour independent of time, place, and individual conditioning, it follows inevitably that it cannot be the only one. Although the incest complex is undoubtedly one of the most fundamental and best known complexes, it must obviously have its feminine counterpart which will express itself in corresponding forms. (At the time I proposed calling it the Electra complex.)³ But incest, after all, is not the only complication in human life, though this sometimes seems to be the case according to Freudian psychology. There are also other typical patterns which regulate the relation of father to son, mother to daughter, parents to children, brothers and sisters to each other, and so on. Oedipus is only one of the existing patterns and determines only the behaviour of the son, and this only up to a point. Mythology, folklore, dreams, and psychoses do not fall short in this respect. They offer a veritable plethora of patterns and formulas not only for family relationships but also for man and woman, individual and society, conscious and unconscious, dangers to body and soul, and so forth.

[1262] These archetypes exert a decisive influence on human relationships. Here I would mention only the eminently practical significance of the animus (the archetype of man in woman) and anima (the archetype of woman in man), which are the source of so much fleeting happiness and long-drawn-out suffering in marriage and friendship.

[1263] The author has much to say about these things, based on her medical practice and on her arduous but rewarding work with people. She deserves to be heard, and I hope her book will find a large number of attentive readers.

August 1956

PREFACE TO DE LASZLO: "PSYCHE AND SYMBOL"¹

[1264] Dr. de Laszlo has risked shocking the American reader by including some of my most difficult essays in her selection from my writings. In sympathy with the reader I acknowledge how tempting if not unavoidable it is to fall into the trap of appearances as the eye wanders over the pages in a vain attempt to get at the gist of the matter in the shortest possible time. I know of so many who, opening one of my books and, stumbling upon a number of Latin quotations, shut it with a bang, because Latin suggests history and therefore death and unreality. I am afraid my works demand some patience and some thinking. I know: it is very hard on the reader who expects to be fed by informative headlines. It is not the conscientious scientist's way to bluff the public with impressive résumés and bold assertions. He tries to explain, to produce the necessary evidence, and thus to create a basis for understanding. In my case, moreover, understanding is not concerned with generally known facts, but rather with those that are little known or even new. It was therefore incumbent upon me to make these facts known. In so far as such unexpected novelties demand equally unexpected means of explanation I found myself confronted with the task of explaining the very nature of my evidential material.

[1265] The facts are experiences gained from a careful and painstaking analysis of certain psychic processes observed in the course of psychic treatment. As these facts could not be satisfactorily explained by themselves, it was necessary to look round for possible comparisons. When, for instance, one comes across a patient who produces symbolic mandalas in his dreams or his waking imagination and proceeds to explain these circular images in terms of certain sexual or other fantasies, this explanation carries no conviction, seeing that another patient develops wholly different motivations. Nor is it permissible to assume that a sexual fantasy is a more likely motivation than, for instance, a power drive, since we know from experience that the individual's disposition will of necessity lead him to give preference to the one or the other. Both patients, on the other hand, may have one fact in common—a state of mental and moral confusion. We would surely do better to follow up this clue and try to discover whether the circular images are connected with such a state of mind. Our third case producing mandalas is perhaps a schizophrenic in such a disturbed state that he cannot even be asked for his accompanying fantasies. This patient is obviously completely dissolved in a chaotic condition. Our fourth case is a little boy of seven who has decorated the corner of the room where his bed stands with numerous mandalas without which he cannot go to sleep. He only feels safe

when they are around him. His fantasy tells him that they protect him against nameless fears assailing him in the night. What is his confusion? His parents are contemplating divorce.² And what shall we say of a hard-boiled scientific rationalist who produced mandalas in his dreams and in his waking fantasies? He had to consult an alienist, as he was about to lose his reason because he had suddenly become assailed by the most amazing dreams and visions. What was *his* confusion? The clash between two *equally real* worlds, one external, the other internal: a fact he could no longer deny.³

[1266] There is no need to prolong this series since, leaving aside all theoretical prejudices, the underlying reason for producing a mandala seems to be a certain definable mental state. But have we any evidence which might explain why such a state should produce a mandala? Or is this mere chance? Consequently we must ask whether our experiences are the only ones on record and, if not, where we can find comparable occurrences. There is no difficulty in finding them; plenty of parallels exist in the Far East and the Far West, or right here in Europe, several hundred years ago. The books of reference can be found in our university libraries, but for the last two hundred years nobody has read them, and they are—oh horror!—written in Latin and some even in Greek. But are they dead? Are those books not the distant echo of life once lived, of minds and hearts quick with passions, hopes, and visions, as keen as our own? Does it matter so much whether the pages before us tell the story of a patient still alive, or dead for fifty years? Does it really matter whether their confessions, their anguish, their strivings speak the English of today or Latin or Greek? No matter how much we are of today, there has been a yesterday, which was just as real, just as human and warm, as the moment we call Now, which—alas—in a few hours will be a yesterday as dead as the first of January anno Domini 1300. A good half of the reasons why things now are what they are lies buried in yesterday. Science in its attempt to establish causal connections has to refer to the past. We teach comparative anatomy, why not comparative psychology? The psyche is not only of today, it reaches right back to prehistoric ages. Has man really changed in ten thousand years? Have stags changed their antlers in this short lapse of time? Of course the hairy man of the Ice Ages has become unrecognizable when you try to discover him among the persons you meet on Fifth Avenue. But you will be amazed when you have talked with them for a hundred hours about their intimate life. You will then read the mouldy parchments as if they were the latest thrillers. You will find the secrets of the modern consulting room curiously expressed in abbreviated mediaeval Latin or in an intricate Byzantine hand.

[1267] What the doctor can hear, when he listens attentively, of fantasies, dreams, and intimate experiences is not mentioned in the Encyclopaedia Britannica or in textbooks and scientific journals. These secrets are jealously guarded, anxiously

concealed, and greatly feared and esteemed. They are very private possessions, never divulged and talked about, because they are feared as ridiculous and revered as revelations. They are numinous, a doubtful treasure, perhaps comical, perhaps miraculous, at all events a painfully vulnerable spot, yet presiding over all the crossroads of one's individual life. They are officially and by general consent just as unknown and despised as the old parchments with their indecipherable and unaesthetic hieroglyphics, evidence of old obscurantisms and foolishness. We are ignorant of their contents, and we are equally ignorant of what is going on in the deeper layers of our unconscious, because "those who know do not talk, those who talk do not know."⁴ As inner experiences of this kind increase, the social nexus between human beings decreases. The individual becomes isolated for no apparent reason. Finally this becomes unbearable and he has to confide in someone. Much will then depend on whether he is properly understood or not. It would be fatal if he were to be misinterpreted. Fortunately, such people are instinctively careful and as a rule do not talk more than necessary.

[1268] When one hears a confession of this kind, and the patient wants to understand himself better, some comparative knowledge will be most helpful. When the hard-boiled rationalist mentioned above came to consult me for the first time, he was in such a state of panic that not only he but I myself felt the wind blowing over from the lunatic asylum! As he was telling me of his experiences in detail he mentioned a particularly impressive dream. I got up and fetched an ancient volume from my bookshelf and showed it to him, saying: "You see the date? Just about four hundred years old. Now watch!" I opened the book at the place where there was a curious woodcut, representing his dream almost literally. "You see," I said, "your dream is no secret. You are not the victim of a pathological insult and not separated from mankind by an inexplicable psychosis. You are merely ignorant of certain experiences well within the bounds of human knowledge and understanding." It was worth seeing the relief which came over him. He had seen with his own eyes the documentary evidence of his sanity.

[1269] This illustrates why historical comparison is not a mere learned hobby but very practical and useful. It opens the door to life and humanity again, which had seemed inexorably closed. It is of no ultimate advantage to deny or reason away or ridicule such seemingly abnormal or out-of-the-way experiences. They should not get lost, because they contain an intrinsic individual value, the loss of which entails definite damage to one's personality. One should be aware of the high esteem which in past centuries was felt for such experiences, because it explains the extraordinary importance that we ignorant moderns are forced to attribute to them in spite of ourselves.

[1270] Understanding an illness does not cure it, but it is a definite help because you can cope with a comprehensible difficulty far more easily than with an incomprehensible darkness. Even if in the end a rational explanation cannot be reached, you know at least that you are not the only one confronted by a “merely imaginary” wall, but one of the many who have vainly tried to climb it. You still share the common human lot and are not cut off from humanity by a subjective defect. Thus you have not suffered the irreparable loss of a personal value and are not forced to continue your way on the crutches of a dry and lifeless rationalism. On the contrary, you find new courage to accept and integrate the irrationality of your own life and of life in general.

[1271] Instincts are the most conservative determinants of any kind of life. The mind is not born a *tabula rasa*. Like the body, it has its predetermined individual aptitudes: namely, patterns of behaviour. They become manifest in the ever-recurring patterns of psychic functioning. As the weaver-bird will infallibly build its nest in the accustomed form, so man despite his freedom and superficial changeability will function psychologically according to his original patterns—up to a certain point; that is, until for some reason he collides with his still living and ever-present instinctual roots. The instincts will then protest and engender peculiar thoughts and emotions, which will be all the more alien and incomprehensible the more man’s consciousness has deviated from its original conformity to these instincts. As nowadays mankind is threatened with self-destruction through radioactivity, we are experiencing a fundamental reassertion of our instincts in various forms. I have called the psychological manifestations of instinct “archetypes.”

[1272] The archetypes are by no means useless archaic survivals or relics. They are living entities which cause the preformation of numinous ideas or dominant representations. Insufficient understanding, however, accepts these prefigurations in their archaic form, because they have a numinous fascination for the underdeveloped mind. Thus Communism is an archaic, highly insidious pattern of life which characterizes primitive social groups. It implies lawless chieftainship as a vitally necessary compensation, a fact which can be overlooked only by means of a rationalistic bias, the prerogative of a barbarous mind.

[1273] It is important to remember that my concept of the archetypes has been frequently misunderstood as denoting inherited ideas or as a kind of philosophical speculation. In reality they belong to the realm of instinctual activity and in that sense they represent inherited patterns of psychic behaviour. As such they are invested with certain dynamic qualities which, psychologically speaking, are characterized as “autonomy” and “numinosity.”

[1274] I do not know of any more reliable way back to the instinctual basis than through an understanding of these psychological patterns, which enable us to

recognize the nature of an instinctive attitude. The instinct to survive is aroused as a reaction against the tendency to mass suicide represented by the H-bomb and the underlying political schism of the world. The latter is clearly man-made and due to rationalistic distortions. Conversely, if understood by a mature mind, the archetypal preformations can yield numinous ideas ahead of our actual intellectual level. That is just what our time is in need of. This, it seems to me, is an additional incentive to pay attention to the unconscious processes which in many persons today anticipate future developments.

[1275] I must warn the reader: this book will not be an easy pastime. Once in a while he will meet with thoughts which demand the effort of concentration and careful reflection—a condition unfortunately rare in modern times. On the other hand, the situation today seems to be serious enough to cause at least uneasy dreams if nothing else.

August 1957

FOREWORD TO BRUNNER: "DIE ANIMA ALS SCHICKSALSPROBLEM DES MANNES"¹

[1276] The antecedents of this book are such that it might give rise to misunderstandings unless the reader is acquainted with them beforehand. Let me therefore say at once that its subject-matter is a dialogue extending over a period of eight years. The partners to this dialogue made it a condition from the start that the record they kept of it should be as honest and complete as was humanly possible. In order to fulfil this condition, and not restrict it to the conscious aspects of the situation, they made it their task to take note also of the unconscious reactions that accompanied or followed the dialogue. Obviously, this ambitious project could be completed only if the unconscious reactions of *both* partners were recorded. A "biographical" debate of such a nature would indeed be something unique in our experience, requiring exceptionally favourable circumstances for its realization. In view of the unusual difficulties she was faced with, the author deserves our thanks for having reproduced, scrupulously and in all the necessary detail, at least three-quarters of the dialogue. Her experiment will be acclaimed by all those who are interested in the real life of the psyche, and more particularly because it gives a vivid account of a typical masculine problem which invariably arises in such a situation.

[1277] Although every case of this kind follows an archetypal ground plan, its value and significance lie in its uniqueness, and this uniqueness is the criterion of its objectivity. The true carrier of reality is the individual, and not the "statistical average" who is a mere abstraction. So if the author confines her observations to two persons only, this shows her feeling for the psychological facts. The value of the personality, too, lies in its uniqueness, and not in its collective and statistical qualities, which are merely those of human species and, as such, irreducible factors of a suprapersonal nature. Although the limitation to two persons creates an "unscientific" impression of subjectivity, it is actually a guarantee of psychological objectivity: this is how real psychic life behaves, this is what happens in reality. That part of it which can be formulated theoretically belongs to the common foundations of psychic life and can therefore be observed just as easily under other conditions and in other individuals. Scientific insight is essentially a by-product of a psychological process of dialectic. During this process, "true" and "untrue," "right" and "wrong" are valid only in the moral sense and cannot be judged by any general criterion of "truth" or "rightness." "True" and "right" simply tell us whether what is happening is "true" or "right" for the person concerned.

[1278] The reader of this book is thus an invisible listener at a serious dialogue between two cultivated persons of our time, who discuss the various questions that come their way. Both of them make their contribution in complete freedom and remain true to their purpose throughout. I lay particular emphasis on this because it is by no means certain at the outset that such a dialogue will be continued. Often these discussions come to an abrupt stop for lack of enthusiasm in one partner or both, or for some other reason, good or bad. Very often, too, they give up at the first difficulty. The circumstances must have been unusually favourable for the dialogue to have continued over such a long period of time. Special credit is due to the author for having recorded the proceedings on two levels at once and successfully communicated them to the outside world. The thoughts and interior happenings she describes form a most instructive *document humain*, but its very uniqueness exposes it to the danger of being misunderstood and contemptuously brushed aside as a “subjective fantasy.” For it is concerned mainly with that special relationship which Freud summed up under the term “transference,” whose products he regarded as “infantile fantasies.” As a result of this devaluation and rationalistic prejudice, their importance as phenomena of psychic transformation was not recognized. This scientific sin of omission is only one link in the long chain of devaluation of the human psyche that has nothing to justify it. It is a symptom of profound unconsciousness that our scientific age has lost sight of the paramount importance of the psyche as a fundamental condition of human existence. What is the use of technological improvements when mankind must still tremble before those infantile tyrants, ridiculous yet terrible, in the style of Hitler? Figures like these owe their power only to the frightening immaturity of the man of today, and to his barbarous unconsciousness. Truly we can no longer afford to underestimate the importance of the psychic factor in world affairs and to go on despising the efforts to understand psychic processes. We are still very far from understanding where we ourselves are at fault, and this book should grant us a deep insight. It is, indeed, only a random sample, but all experience consists of just that. Without individual experience there can be no general insight.

[1279] The author has done well to take a well-known case from the history of literature as an introduction to the real *pièce de résistance* of her book. The case is that of Rider Haggard, who was afflicted with a similar problem. (One might also mention Pierre Benoît and Gérard de Nerval.) Rider Haggard is without doubt the classic exponent of the anima motif, though it had already appeared among the humanists of Renaissance, for instance, as the nymph Polia in the *Hypnerotomachia* of Francesco Colonna,² or as a psychological concept in the writings of Richard White of Basingstoke,³ or as a poetic figure among the “fedeli d’amore.”⁴

[1280] The motif of the anima is developed in its purest and most naïve form in Rider Haggard. True to his name, he remained her faithful knight throughout his literary life and never wearied of his conversation with her. He was a spiritual kinsman of René d'Anjou, a latter-day troubadour or knight of the Grail, who had somehow blundered into the Victorian Age and was himself one of its most typical representatives. What else could he do but spin his strange tale of past centuries, harking back to the figures of Simon Magus and Helena, Zosimos and Theosebeia, in the somewhat sorry form of a popular "yarn?" Psychology, unfortunately, cannot take aesthetic requirements into account. The greatness and importance of a motif like that of the anima bear no relation to the form in which it is presented. If Rider Haggard uses the modest form of a yarn, this does not detract from the psychological value of its content. Those who seek entertainment or the higher art can easily find something better. But anyone who wants to gain insight into his own anima will find food for thought in *She*, precisely because of the simplicity and naïveté of presentation, which is entirely devoid of any "psychological" intent.

[1281] Rider Haggard's literary work forms an excellent introduction to the real purpose of this book, since it provides a wealth of material illustrating the symbolism of the anima and its problems. Admittedly, *She* is only a flash in the pan, a beginning without continuation, for at no point does the book come down to earth. Everything remains stuck in the realm of fantasy, a symbolic anticipation. Rider Haggard was unaware of his spiritual predecessors, so did not know that he had been set a task at which the philosophical alchemists had laboured, and which the last of the Magna Opera, Goethe's *Faust*, could bring to fruition not in life but only after death, in the Beyond, and then only wistfully. He followed in the footsteps of the singers and poets who enchanted the age of chivalry. The romantic excursions of his German contemporary, Richard Wagner, did not pass off so harmlessly. A dangerous genius, Friedrich Nietzsche, had a finger in the pie and Zarathustra raised his voice, with no wise woman at his side as partner to the dialogue. This mighty voice emanated from a migraine-ridden bachelor, "six thousand feet beyond good and evil," who met his "Dudu and Suleika"⁵ only in the tempests of madness and penned those confessions which so scandalized his sister that traces of them can be found only in his clinical history. This sounds neither good nor beautiful, but it is part of the business of growing up to listen to the fearful discords which real life grinds out and to include them among the images of reality. Truth and reality are assuredly no music of the spheres—they are the beauty and terror of Nature herself.

[1282] The richest yield of all is naturally to be found in the primary material itself, that is to say in the dreams, which are not thought up or "spun" like a yarn. They are involuntary products of nature, spontaneously expressing the psychic processes without the interference of the conscious will. But this richness reveals itself, one

might say, only to him who understands the language of animals and plants. Although this is a tall order, it is not putting too great a burden on the learning capacity of an intelligent person who has a moderate amount of intuition and a healthy aversion for doctrinal opinions. Following its instinct for truth, intuition goes along with the stream of images, feels its way into them until they begin to speak and yield up their meaning. It rediscovers forgotten or choked-up paths where many have wandered in distant times and places—perhaps even one’s partner in the dialogue. Picking up the trail, he will pursue a parallel path and in this way learn the natural structure of the psyche.

[1283] The author has successfully evoked in the dreamer the intuitive attitude he needs in order to follow the unconscious process of development. The “interpretation” does not adhere to any particular theory, but simply takes up the symbolic hints given by the dreams. Even though use is made of psychological concepts such as the anima, this is not a theoretical assumption, because “anima” is merely a name for a special group of typical psychic happenings that anyone can observe. In an extensive dialogue like this, interpretations can only be passing phases and tentative formulations, but they do have to prove themselves correct when taken as a whole. Only at the end of the journey will it be discovered whether they have done so, and whether one was on the right path or not. The dialectical process is always a creative adventure, and at every moment one has to stake one’s very best. Only then, and with God’s help, can the great work of transformation come to pass.

April 1959

XI

CIVILIZATION IN TRANSITION

(related to Volume 10 of the Collected Works)

REPORT ON AMERICA¹

[1284] Lecturer described a number of impressions he had gained on two journeys in North America.² The psychological peculiarities of the Americans exhibit features that would be accessible to psychoanalysis, since they point to intense sexual repression. The reasons for repression are to be sought in the specifically American complex, namely, living together with lower races, more particularly the Negroes. Living together with barbarous races has a suggestive effect on the laboriously subjugated instincts of the white race and drags it down. Hence strongly developed defensive measures are necessary, which manifest themselves in the particular aspects of American culture.

NO THE PSYCHOLOGY OF THE NEGRO¹

[1285] The psychoses of Negroes are the same as those of white men. In milder cases the diagnosis is difficult because one is not sure whether one is dealing with superstition. Investigation is complicated by the fact that the Negro does not understand what one wants of him, and besides that is ignorant [does not know his age, has no idea of time].² He shows a great inability to look into his own thoughts, a phenomenon that is analogous to resistance among our patients. Little is said of hallucinations, and equally little of delusional ideas and dreams. — The Negro is extraordinarily religious: his concepts of God and Christ are very concrete. The lecturer has pointed out on an earlier occasion³ how certain qualities of the Americans (for instance, their self-control) may be explained by their living together with the (uncontrolled) Negroes. In the same way this living together also exerts an influence on the Negro. For him the white man is pictured as an ideal: in his religion Christ is always a white man. He himself would like to be white or to have white children; conversely, he is persecuted by white men. In the dream examples given by the lecturer, the wish or the task of the Negro to adapt himself to the white man appears very frequently. One is struck by the large number of sacrificial symbols that occur in the dreams, just as the lecturer has mentioned in his book *Wandlungen und Symbole der Libido*.⁴ This is yet another indication that such symbols are not only Christian but have their origin in a biological necessity.

A RADIO TALK IN MUNICH¹

[1286] Your question is not so easy to answer. My interest in these matters was not the result of a primary interest in Chinese philosophy, from a study of which, it might be supposed, I had learnt all sorts of valuable things for my psychology. On the contrary, Chinese thought was very alien to me to begin with. I owe my relations to China and to Richard Wilhelm simply and solely to certain psychological discoveries. In the first place, it was the discovery of the collective unconscious, that is to say, of impersonal psychic processes, that aroused my interest in primitive and Oriental psychology. Among these impersonal psychic processes there are quite a number which seem absolutely strange and incomprehensible and cannot be brought into connection with any of the historical symbols known to us, but for which we can find plenty of unquestionable analogies in the psychologies of the Orient. Thus a whole group or layer of impersonal contents can only be understood in terms of the psychology of primitives, while others have their nearest analogies in India or China. It had previously been supposed that mythological symbols were disseminated by migration. But I have found that the occurrence of the same symbols in different countries and continents does not depend on migration, but rather on the spontaneous revival of the same contents.

[1287] Years of observing such processes has convinced me that—for the present at least—the unconscious psyche of Europeans shows a distinct tendency to produce contents that have their nearest analogies in the older Chinese philosophy and the later Tantric philosophy. This prompted me to submit my observations to the eminent sinologist Richard Wilhelm, who thereupon confirmed the existence of some astonishing parallels. The fruit of our collaboration is the recently published book called *The Secret of the Golden Flower*.² These parallels bear out a conjecture I have long held, that our psychic situation is now being influenced by an irruption of the Oriental spirit, and that this is a factor to be reckoned with. What is going on is analogous to the psychic change that could be observed in Rome during the first century of our era. As soon as the Romans, beginning with the campaigns of Pompey, made themselves the political masters of Asia Minor, Rome became inundated with Hellenistic-Asiatic syncretism. The cults of Attis, Cybele, Isis, and the Magna Mater spread throughout the Roman Empire. Mithras conquered Roman officialdom and the entire army, until all these cults were overthrown by Christianity. I do not know how much the spiritual and political decline of Spain and Portugal had to do with their conquest of the primitive South American continent, but the fact remains that the two

countries which first established their rule in East Asia, namely Holland and England, were also the first to be thoroughly infected with theosophy. It seems to be a psychological law that though the conquerer may conquer a country physically, he will secretly absorb its spirit. Today the old China has succumbed to the West, and my purely empirical findings show that the Chinese spirit is making itself clearly perceptible in the European unconscious. You will understand that this statement is no more for me than a working hypothesis, but one which can claim a considerable degree of probability in view of the historical analogies.

*

[1288] My journey to Africa³ arose from the same need that had taken me to New Mexico⁴ the year before. I wanted to get to know the psychic life of primitives at first hand. The reason for this is the aforementioned fact that certain contents of the collective unconscious are very closely connected with primitive psychology. Our civilized consciousness is very different from that of primitives, but deep down in our psyche there is a thick layer of primitive processes which, as I have said, are closely related to processes that can still be found on the surface of the primitive's daily life. Perhaps I can best illustrate this difference by means of an example. When I ask an employee to deliver a letter to a certain address, I simply say to him: "Please take this letter to Mr. X." In Africa I lived for a time with a very primitive tribe, the Elgonis, who inhabit the primeval forests of Mount Elgon, in East Africa, and are still partly troglodytes. One day I wanted to send some letters. The nearest white men were some engineers who were working at the terminus of a branch line of the Uganda railway, two and a half days' journey away. In order to reach them, I needed a runner, and at my request the chief put a man at my disposal. I gave him a bundle of letters, telling him in Swahili (which he understood) to take the letters to the white *bwana*s. Naturally, everybody within a radius of a hundred miles would know where to find them, for news travels fast in Africa. But after receiving my order, the man remained standing before me as though struck dumb and did not stir from the spot. I thought he was waiting for baksheesh in the form of cigarettes, and gave him a handful, but he stood there as dumb and stiff as before. I had no idea what this meant, and, looking round me in perplexity, my eye fell on my safari headman Ibrahim, a long thin Somali, who, squatting on the ground, was watching the scene, grinning. In his frightful English he said to me: "You no do it like so, Bwana, but like so—" And he sprang up, seized his rhinoceros whip, cracked it through the air a couple of times in front of the runner, then gripped him by the shoulders, and with shouts and gesticulations delivered himself of the following peroration: "Here, the great bwana M'zee, the wise old man, gives you letters. See, you hold them in your hand. But you must put them in a cleft stick. Ho boys"—this to my servants—"bring a cleft stick,

give it to this pagan. Hold it in your hand so—put the letters in the cleft here—bind it tight with grass—so—and now hold it high, so that all will see you are the runner of the great bwana. And now go to the bwanas at the waterfall and seek one till you find him, and then go to him and say to him: ‘The great bwana M’zee has given me letters, they are in my stick here, take them!’ And the white bwana will say: ‘It is well.’ Then you can return home. And now run, but so—” and Ibrahim began running with upraised whip—“so must you run and run, until you come to the place where the little houses go on wheels. Run, run, you dog, run like hell!” The runner’s face had gradually lit up as though witnessing a great revelation. Grinning all over, he raised his stick and hurtled away from us, as though shot from a cannon, Ibrahim close behind him with cracking whip and a flood of curses. The man ran 74 miles in 36 hours without stopping.

[1289] Ibrahim had succeeded, with an enormous expenditure of mime and words, in putting the man into the mood of the runner, hypnotizing him into it, so to speak. This was necessary because a mere order from me could not conjure up a single movement. Here you see the chief difference between primitive and civilized psychology: with us a word is enough to release an accumulation of forces, but with primitives an elaborate pantomime is needed, with all manner of embellishments which are calculated to put the man into the right mood for acting. If these primitive vestiges still exist in us—and they do—you can imagine how much there is in us civilized people that cannot catch up with the accelerated tempo of our daily life, gradually producing a split and a counter-will that sometimes takes a culturally destructive form. That this really is so, is clearly shown by the events of the last few decades.

[1290] Naturally, the purpose of my travels was not to investigate only the differences, but also the similarities between the civilized and the primitive mind. Here there are many points of connection. For instance, in dreams we think in very much the same way as the primitive thinks consciously. With primitives, waking life and dream life are less divided than with us—so little, in fact, that it is often difficult to find out whether what a primitive tells you was real or a dream. Everything that we reject as mere fantasy because it comes from the unconscious is of extraordinary importance for the primitive, perhaps more important than the evidence of his senses. He values the products of the unconscious—dreams, visions, fantasies, and so on—quite differently from us. His dreams are an extremely important source of information, and the fact that he has dreamt something is just as significant for him as what happens in reality, and sometimes very much more significant. My Somali boys, those of them that could read, had their Arabic dream books with them as their only reading matter on the journey. Ibrahim assiduously instructed me in what I ought to

do if I dreamt of Al Khidr, the Verdant One,⁵ for that was the first angel of Allah, who sometimes appeared in dreams.

[1291] For primitives, certain dreams are the voice of God. They distinguish two types of dream: ordinary dreams that mean nothing, and the dreams they call the great vision. So far as I was able to judge, the “big dreams” are of a kind that we too would consider significant. The only dream that occurred while I was there—at least, the only one that was reported to me—was the dream of an old chief, in which he learnt that one of his cows had calved, and was now standing with her calf down by the river, in a particular clearing. He was too old to keep track of his many cattle that pastured in the various open places in the forest, so he naturally didn’t know this cow was going to calve, let alone where. But the cow and the calf were found just where he had dreamt they would be. These people are extraordinarily close to nature. Several other things happened which made it quite clear to me why they were so convinced that their dream told the truth. Part of the reason is that their dreams often fulfil the thinking function over which they still do not have full conscious control. They themselves say that the appearance of the white man in their country has had a devastating effect on the dream life of their medicine-men and chiefs. An old medicine-man told me with tears streaming down his face: “We have no dreams any more since the white man is in the land.” After many talks on this subject, I finally discovered that the leading men owed their leadership chiefly to dreams that came true. Since everything is now under British control, the political leadership has been taken out of the hands of the chiefs and medicine-men. They have become superfluous, and the guiding voice of their dreams is silenced.

FOREWORDS TO JUNG: "SEELENPROBLEME DER GEGENWART"

First Edition (1931)

[1292] The lectures and essays contained in this volume¹ owe their existence primarily to questions addressed to me by the public. These questions are enough in themselves to sketch a picture of the psychological problems of our time. And, like the questions, the answers have come from my personal and professional experience of the psychic life of our so remarkable era. The fundamental error persists in the public that there are definite answers, "solutions," or views which need only be uttered in order to spread the necessary light. But the most beautiful truth—as history has shown a thousand times over—is of no use at all unless it has become the innermost experience and possession of the individual. Every unequivocal, so-called "clear" answer always remains stuck in the head and seldom penetrates to the heart. The needful thing is not to *know* the truth but to *experience* it. Not to have an intellectual conception of things, but to find our way to the inner, and perhaps wordless, irrational experience—that is the great problem. Nothing is more fruitless than talking of how things must or should be, and nothing is more important than finding the way to these far-off goals. Most people know very well how things should be, but who can point the way to get there?

[1293] As the title of this book shows, it is concerned with problems, not solutions. The psychic endeavours of our time are still caught in the realm of the problematical; we are still looking for the essential question which, when found, is already half the solution. These essays may open the reader's eyes to our wearisome struggle with that tremendous problem, the "soul," which perhaps torments modern man in even higher degree than it did his near and distant ancestors.

Küsnacht-Zurich, December 1930

Second Edition (1933)

[1294] As only one and a half years have gone by since the appearance of the first edition, there are no reasons for essential alterations in the text. The collection of my essays therefore appears in unaltered form. And as no fundamental objections or misunderstandings that might have provided occasion for an explanatory answer have become known to me, there is no need either of a longer foreword. At any rate, the reproach of psychologism so often levelled at me would be no excuse for a long

disquisition, for no fair-minded person will expect me to prefer the attitude of a metaphysician or a theologian in my own field of work. I shall never stop seeing and judging all observable psychic phenomena psychologically. Every reasonable man knows that this does not express any final and ultimate truth. Absolute assertions belong to the realm of faith—or of immodesty.

Küsnacht-Zurich, July 1932

Italian New Edition (1959)²

[1295] This book is a collection of lectures and essays which originated in the 1920's and constitute volume III of my "Psychologische Abhandlungen." They are for the most part popular expositions of certain fundamental questions of practical psychology, which concerns itself not only with the sick but with the healthy. The latter also have "problems," the same in principle as those of the neurotic, but because practically everybody has them and knows them they are counted as "contemporary questions," while in their neurotic form they appear rather as biographical *curiosa*. The treatment of the neuroses has naturally confronted doctors with many questions they could not answer by medical means alone. They had to resort to an academic psychology that had never concerned itself with living human beings, or only under restrictive experimental conditions which were a direct hindrance to the natural expression of the psyche as a whole. Since the doctors received no help from outside (with the exception of a few philosophers like C. G. Carus, Schopenhauer, Eduard von Hartmann, Nietzsche), they saw themselves compelled to build up a medical psychology of real human beings. The essays in this volume bear witness to these efforts.

March 1959

FOREWORD TO ALDRICH: "THE PRIMITIVE MIND AND MODERN CIVILIZATION"¹

[1296] The author of this book, who studied analytical psychology in Zurich a few years ago, has asked me for a few introductory words to his work. I accede to his request with all the more pleasure as I was not bored but decidedly delighted by reading his book. Books of this kind are often of a very dry, though learned and useful, character. There are indeed not a few of them, because, together with the discovery of a new empirical psychology, the modern scientific mind has become interested in what were formerly called "curiosités et superstitions des peuples sauvages," a field formerly left to missionaries, traders, hunters, and geographical and ethnographical explorers. A rich harvest of facts has been gleaned and gathered up in long rows of volumes even more formidable than Sir James Frazer's *Golden Bough* series. As everywhere in the science of the nineteenth century, the collection type of method has prevailed, producing an accumulation of disconnected and undigested facts which in the long run could not fail to make a survey almost impossible. Such an ever increasing accumulation, here as well as in other sciences, has hindered the formation of judgment. It is a truism that there are never facts enough, but, on the other hand, there is only one human brain, which only too easily gets swamped by the boundless flood of material. This happens particularly to the specialist, whose mind is trained to a careful consideration of facts. But when judgment is required the mind must turn away from the impression of the facts and should lift itself to a higher level from which a survey becomes possible. One might almost say: as a rule the higher standpoint is not given by the specialized science but by a convergence of viewpoints from other scientific realms.

[1297] Thus the understanding of primitive psychology would have remained an almost insoluble task without the assistance of mythology, folklore, history, and comparative religion. Sir James Frazer's work is a splendid example of this composite method. It is rather astonishing that among the co-operating sciences psychology seems to be lacking. It was, however, not completely absent. Among the many who tried to tackle the problems of the primitive mind, no one has done so without psychology. But the psychological point of view employed by each investigator was his own—just as if there were only one psychological standpoint, i.e., the author's own psychology. Seen from Tylor's point of view, animism is quite obviously his individual bias. Lévy-Bruhl measures primitive facts by means of his extremely rational mind. From his standpoint it appears quite logical that the primitive mind should be an "état

prélogique.” Yet the primitive is far from being illogical and is just as far from being “animistic.” He is by no means that strange being from whom the civilized man is separated by a gulf that cannot be bridged. The fundamental difference between them is not a difference in mental functioning, but rather in the premises upon which the functioning is based.

[1298] The reason why psychology has hitherto rendered so little assistance to the explorer in the vast field of primitive psychology is not so much the natural disinclination of the specialist to appeal to principles outside his particular domain as the fact that a psychology which would be really helpful simply did not exist. The psychology that is needed must be a psychology of the complex functions, i.e., a psychology that does not reduce the complexities of the mind to their hypothetical elements, which is the method of experimental or physiological psychology. The first attempt at a complex psychology was made by Freud, and his essay *Totem and Taboo* was one of the first direct contributions of the new psychology to the investigation of the primitive mind. It matters little that his attempt is nothing more than an application of his sexual theory, originally gleaned from pathological minds. His essay nevertheless demonstrates the possibility of a *rapprochement* between psychology and the problem of the primitive mind. Sometime before the work above mentioned, I undertook a similar task² that eventually led me to the primitive mind, but with a very different method. While Freud’s method consisted in the application of an already existing theory, my method was a comparative one. I have reason to believe that the latter yields better results. The main reason is that our new psychology is in no way advanced enough to present a theory of the mind that would have universal application. With modesty we can claim no more than the possession of sound facts and some rules of thumb which might prove useful in the attempt to master the problem of the primitive mind.

[1299] Mr. Aldrich, I observe, has made use of his studies in analytical psychology, to the advantage of his research. His sane and balanced opinions, equally distant from the Charybdis of dry empirical enumeration of facts and the Scylla of deduction from arbitrary premises, owe their vitality and colour in no small measure to a consideration of analytical psychology. I am sure that the analytical psychologist will welcome Mr. Aldrich’s book as one of the most vivid and clear presentations of the primitive mind in its relation to civilized psychology. I may also express the hope that the co-operation of the psychologist will prove its usefulness to all students of primitive psychology who approach their subject from the ethnological standpoint.

PRESS COMMUNIQUÉ ON VISITING THE UNITED STATES¹

September 1936

[1300] The reason why I come to the United States is the fact that Harvard University has bestowed upon me the great honour of inviting me to its Tercentenary Celebration. Being a psychopathologist as well as psychologist, I have been asked to participate in a symposium about “Psychological Factors Determining Human Behaviour.”²

[1301] This is not my first visit to the United States, though my last visit dates back as far as 1924. I am eagerly looking forward to observing the changes which the last eventful decade has brought to public as well as to private life over here and to compare them with those of our own profoundly upset Europe. It is my sincere hope to find more common sense, more social peace, and less insanity in the United States than in the old countries. As a psychologist I am deeply interested in mental disturbances, particularly when they infect whole nations. I want to emphasize that I despise politics wholeheartedly: thus I am neither a Bolshevik, nor a National Socialist, nor an Anti-Semite. I am a neutral Swiss and even in my own country I am uninterested in politics, because I am convinced that 99 per cent of politics are mere symptoms and anything but a cure for social evils. About 50 per cent of politics is definitely obnoxious inasmuch as it poisons the utterly incompetent mind of the masses. We are on our guard against contagious diseases of the body, but we are exasperatingly careless when it comes to the even more dangerous collective diseases of the mind.

[1302] I make this statement in order to disillusion any attempt to claim me for any particular political party. I have some reason for it, since my name has been repeatedly drawn into the political discussion, which is, as you best know, in a feverish condition actually. It happened chiefly on account of the fact that I am interested in the undeniable differences in national and racial psychology, which chiefly account for a series of most fatal misunderstandings and practical mistakes in international dealings as well as in internal social frictions. In a politically poisoned and overheated atmosphere the sane and dispassionate scientific discussion of such delicate, yet most important problems has become well-nigh impossible. To discuss such matters in public would be about as successful as if the director of a lunatic asylum were to set out to discuss the particular delusions of his patients in the midst of them. You know, the tragicomical thing is that they are all convinced of their normality as much as the doctor himself of his own mental balance.

[1303] It will soon be thirty years since my first visit to the United States. During this time I watched the tremendous progress of the country, and I learned to appreciate also the enormous change America has undergone and is still undergoing, namely the transition from a still pioneering mood to the very different attitude of a people confined to a definite area of soil.

[1304] I shall spend my time chiefly at Harvard, and after a short visit to the museums of New York I intend to sail again in the first days of October.

PSYCHOLOGY AND NATIONAL PROBLEMS¹

[1305] The question of psychology and national problems with which I have been asked to deal is indeed of some topicality. It is a question, however, that would not have been asked before the World War. People in general were then not aware of any disturbance in the mental or psychic atmosphere of Europe, although the psychological critic or a philosopher of the antique style could have found enough to talk about. It was a prosperous world then and one which believed in what the eye saw and the ear heard and in what rationalism and philosophical positivism had to say. Even the rational possibility of a great war seemed, in spite of historical evidence, a far-fetched and artificial nightmare, nothing more than a theoretical scarecrow occasionally conjured up by politicians and newspapers when they had nothing else to say. One was thoroughly convinced that international, financial, commercial, and industrial relations were so tightly knit together as to exclude the mere possibility of a war. The Agadir incident² and similar gestures seemed to be mere pranks of a psychopathic monarch, otherwise safely enmeshed in an international network of financial obligations, whose gigantic proportions were supposed to rule out any attempts of a serious military nature. Moreover the fabulous development of science, the high standard of public education in most European countries, and a public opinion organized as never before in history, allowed European humanity to believe in man's conscious achievements, in his reason, intelligence and will-power. It almost appeared as if man and his ideals were going to possess the earth and rule it wisely for the welfare of all peoples.

[1306] The World War has shattered this dream and has crushed most of the ideals of the preceding era. In this postwar mood originated the doubt: Is everything right with the human mind? One began to question its sanity because thinking people grew more and more astonished at all the things humanity could do. The benevolent god of science that had done such marvellous things for the benefit of man had uncovered his dark face. He produced the most diabolical war machinery, including the abomination of poison gases, and human reason got more and more obscured by strange and absurd ideas. International relations turned into the most exaggerated nationalism, and the very God of the earth, the *ultima ratio* of all things worldly—money—developed a more and more fictitious character never dreamt of before. Not only the security of the gold standard but also that of treaties and other international arrangements, already badly shaken by the War, did not recover but became increasingly illusory. Nearly all major attempts at reduction of armaments and at

stabilization of international finances went wrong. Slowly it dawned upon mankind that it was caught in one of the worst moral crises the world had ever known.

[1307] It is natural enough that in many quarters the doubt arose as to whether the human mind had not changed. It did not appear preposterous any more to assume that possibly there were peculiar psychological reasons for all these disquieting developments which otherwise could hardly be explained. Many people wondered what psychology would have to say about the world situation. Such questions, as a matter of fact, have often been put to me, and I must confess I always felt not only definitely uncomfortable but singularly incompetent to give a satisfactory answer. The subject is really too complicated. The predominant and immediate reasons for the crisis are factors of an economic and political nature. Inasmuch as these are activities of the human mind they should be subject to certain psychological laws. But the economic factors especially are not wholly psychological in character; they depend to a great extent on conditions that can hardly be linked up with psychology. In politics on the other hand psychology seems to prevail, but there is an ultimate factor of numbers, of sheer force and violence, that corresponds to a caveman's or an animal's psychology rather than to anything human. There is no psychology yet of such infinitely complex matters as economics or politics. It is still quite questionable whether there is any hope at all that psychology can be applied to things due to non-psychological factors. I don't consider myself competent to deal with the ultimate meaning of our world crisis. There are certain sides to it, however, that possess a definitely psychological aspect, offering an opportunity for comment. It seems to be within the reach of contemporary psychology to produce a certain point of view at least.

[1308] Before entering upon this subject I want to say a few words about psychology in general:

[1309] Having given you a short account of what I understand psychology consists of, let me turn now to our subject. First of all a negative statement: I exclude from psychological consideration the strictly economic and political aspect of present-day events. I am doing this because they are, partly at least, non-psychological. Whatever the psychological reasons for the Great War may have been, they transcend my psychological competence. I shall concern myself chiefly with the psychological situation brought about by the War. That there is a so-called psychological situation

at all appears to be borne out by a great number of phenomena which we have to call symptoms. You call a certain phenomenon a symptom when it is obvious that it does not function as a logical means to an end but rather stands out as a mere result of chiefly causal conditions without any obvious purposiveness. Thus the yellow colour of the skin in a case of jaundice is a phenomenon with no purposiveness and we therefore call it a symptom, as contrasted with the war-paint of a Red Indian which is a purposive part of the war ceremonial. Or a man drives a nail into the wall and we ask him why he is doing it; if he answers that it is to hang his coat there, then what he does is purposive because it makes sense. But if he answers that it is because he happened to hold a hammer and a nail in his hands, then his action is a symptom, or at least he wants it to appear as such.

[1310] Likewise we could imagine mass organizations without the Roman salute, lictor bundles, swastikas, neo-paganism, and other paraphernalia because our political parties as well as Standard Oil or Dutch Shell can do without them. Therefore it appears to us as if such peculiarities were chiefly symptoms of a particular causal condition of the mind. On the other hand we know that symbols and ceremonies mainly occur in religious organizations where it is indeed a matter of a peculiar mental state. Of course if you are in that frame of mind you would not talk of symptomatology. On the contrary, you would call those peculiarities purposive and meaningful, because to you they appear to serve a definite end. As long as one is within a certain phenomenology one is not astonished and nobody wonders what it is all about. Such philosophical doubt only comes to the man who is outside the game.

[1311] The countries where the most remarkable symptoms occur are chiefly those that have been actually at war and have therefore found themselves afterwards in a state of appalling misery and disorder. I mean particularly Russia, Germany, Austria, and Italy. No matter what the cause, misery is a definite psychological condition characterized by definite emotions, such as depression, fear, despair, insecurity, unrest, and resentments of every description.

[1312] Since our empirical psychology is based entirely on the experience of individual cases, our argument must necessarily start from the individual. This leads us to the question: What will an individual do when under the strain of acute misery? There is a positive and a negative reaction to such a condition:

1. *Positive.* A greater effort is called forth. The individual will show more strength and will-power and will try to overcome the obstacle or the cause of misery through physical, intellectual, and moral effort. It will be an entirely conscious and rational attempt supported by all the means at an individual's disposal. If the strength of *one* individual is not sufficient he will seek the help of others; perhaps a greater number of individuals will form some sort of organization in order to remove the cause of

suffering. If such an ultimate attempt fails, or if an individual is too weak from the start to show fight, then a negative reaction takes place.

II. *Negative*. Instead of suitable measures of defence, and instead of a concentration of energy, of efforts of the will, and of all the rational ways and methods applicable to such a condition, an emotional reaction will take place. Emotional reaction always denotes an inferior adjustment. This does not necessarily mean that the adjustment is ineffectual. It merely denotes that, if the individual comes through successfully, the success is due to the fact that he has been passively carried through on the crest of an emotional wave rather than by conscious and deliberate effort of the will. In other words the success has been reached in a primitive and inferior way, in the main through a merely instinctive reaction. But more often the emotional reaction is not successful just because it is too primitive and therefore a maladjustment to a perhaps highly complicated situation. In either case the individual is passive and he is more the object of the emotion than its subject. The emotional reaction as a rule consists of depression, fear, and even panic. Emotional conditions always call up instinctive reactions. The hierarchy of human reason becomes weakened and disintegrated, leaving a door open for the intrusion of primitive instinctive forces. *Emotional reaction always means regression*. The first effect of regression is as a rule the reawakening of infantile methods and attitudes. People under the influence of fear and despair very often become infantile, exaggeratedly helpless and demoralized.⁴ Helplessness and panic also lead to group formation, or rather to a clustering together in masses for the sake of gregarious security.

[1313] Group formation under the influence of panic cannot be called an organization because it is not an attempt based on reason and will but on a fundamentally emotional movement. It is an accumulation rather than an organization. Such group formations all show unmistakable traces of infantile and archaic psychology, infantile inasmuch as they always look for the father, and archaic inasmuch as the father-image appears in a mythological setting. It seems to be unavoidable that such group formations regress to primitive tribal associations that are held together on the one hand by a chief or medicine-man, and on the other by a sort of mystical doctrine, the tribal teaching.

[1314] We turn now to the question: What would a nation do when in a state of psychological misery? Since a multitude of people or a nation is nothing but an accumulation of individuals, its psychology is likewise an accumulation of individual psychologies. The individual psyche, however, is characterized by individual differences, partly congenital, partly acquired. Nearly every individual shows certain specific achievements which add to his relative uniqueness. On the other hand each individual is partly similar to any other, a fact that produces the aspect of human

equality. Thus individuals are like each other inasmuch as they have qualities in no way different from those of others, but unlike each other inasmuch as they develop qualities and achievements that cannot be compared with those of other people. Whatever people have in common can accumulate in a group formation, but their individual achievements never accumulate—rather they extinguish each other. Thus a large group, considered as *one* being, exhibits merely the traits common to all people but none of their individual achievements. The traits common to all people consist chiefly of instinctual qualities; these are of a relatively primitive character and indubitably inferior in comparison with the mental level of most of the members of the group. Thus a hundred intelligent people together make one hydrocephalus.

[1315] The psychology of masses is always inferior, even in their most idealistic enterprises. The whole of a nation never reacts like a normal modern individual, but always like a primitive group being. Therefore masses are never properly adjusted except on very primitive levels. Their reactions belong to our second category—the negative form. Man in the group is always unreasonable, irresponsible, emotional, erratic, and unreliable. Crimes the individual alone could never stand are freely committed by the group being. A society woman would rather die than appear at a dinner in an obscene dress, but if it were the fashion in the group she would not hesitate for a second to put on the most shocking monstrosity. Think for a moment of the famous *cul de Paris* that embellished the youth of our older generation. And men are no better. The larger an organization the lower its morality. The leader of a great religious movement, when caught out in a lie, said, “Oh! for Christ you may even lie.”

[1316] Nations being the largest organized groups are from a psychological point of view clumsy, stupid, and amoral monsters like those huge saurians with an incredibly small brain. They are inaccessible to reasonable argument, they are suggestible like hysterical patients, they are childish and moody, helpless victims of their emotions. They are caught in every swindle, called slogans, they are stupid to an amazing degree, they are greedy, reckless, and blindly violent, like a rhino suddenly aroused from sleep. They persevere in every nonsense, in every emotion and resentment, in every prejudice, far beyond the psychological moment, and they get ensnared by the cheapest of all obvious tricks. Most of the time they live in dreams and primitive illusions usually rigged out as “isms.” As long as they can feed on open ground in an undisturbed way they are sleepy and harmless. But if their food gets scarce and they begin to migrate and to encroach upon neighbouring territory, they resort to violence. They are not to be convinced that human beings have evolved much better methods in many thousands of years and that these individual men believe in reason and intelligence.

[1317] Monster groups have a natural leaning to leaders. But a leader always means a group within the nation, and such a group is more greedy and eats more than the other groups it leads. And as all greedy monsters are jealous they get rid of their leaders and call the new condition a democracy, in which nobody rules and nobody is ruled. The logic of this procedure closely resembles the story of the man who got stranded on an uninhabited island. The first thing he did was an act of statesmanship: he called himself a democracy and consequently felt extraordinarily free and in full possession of all political rights.

[1318] Even a group being can't help noticing that in living in a democracy you run your head against remarkably unintelligent restrictions of freedom, imposed upon each free, self-ruling citizen by an invisible, wholly legendary being called the "State." When a monster group first called itself a "democracy" it surely did not think that its former ruler, now dethroned, would turn into a ghost. Yet he did. He became the State.

[1319] The State is the psychological mirror-image of the democracy monster. As the nation always rises as *one man*, the State is just as good as one man. As a matter of fact it is quite a person, of unlimited means, more exacting than any tyrant ever was, greedy to the limit and biologically dangerous. It, the State, is not like a Roman Caesar, enslaving prisoners of war on the lower strata of the population; it squeezes its contributions out of the most vital and most gifted individuals of its domain, making slaves of them for its own wasteful devices. It does not know that energy only works when accumulated. Its energy is *money*. It taps all carefully prepared and studied accumulations of this energy and dissipates it so that it becomes ineffectual, thereby causing an artificial entropy.

[1320] It seems that "democracy" was a suitable name only in the very youth of the State-ghost. In order to support its boundless ambitions two brand-new "isms" had to be invented: Socialism and Communism. They enhance its ultra-democratic character to an extraordinary degree: the man on the lonely island is now the communistic social democracy. Together with these illusions goes another helpful procedure, the hollowing out of money, which in the near future will make all savings illusory and, along with cultural continuity, guaranteed by individual responsibility. The State takes over responsibility and enslaves every individual for its own ridiculous schemes. All this is done by what one calls inflation, devaluation, and, most recently, "dilution," which you should not mix up with the unpopular term "inflation." Dilution is now the right word and only idiots can't see the striking difference between this concept and inflation. Money value is fast becoming a fiction guaranteed by the State. Money becomes paper and everybody convinces everybody else that the little scraps are worth something because the State says so.

[1321] I am by no means sure that what I am saying is not fictitious too. I don't know exactly what has gone wrong, but I have a strong and most uncomfortable feeling that something has gone wrong and that it is even getting worse. I am also certain that I am not the only one to experience such a queer feeling. There must be hundreds of people who have lost their confidence in the direction in which things are apparently moving. As group beings we are all befogged in the same way, but as individuals we might just as well apply as much of our psychiatric knowledge as seems to befit the peculiar symptomatology of our bewildering epoch.

[1322] As I mentioned at the beginning, we find the symptoms chiefly in those nations that have been mangled the most by the war beast. There is for instance the German case. As far back as 1918 I published a paper⁵ in which I called the attention of my contemporaries to an astounding development in the German edition of the collective unconscious. I had caught hold of certain collective dreams of Germans which convinced me that they portrayed the beginning of a national regression analogous to the regression of a frightened and helpless individual, becoming first infantile and then primitive or archaic. I saw Nietzsche's "blond beast" looming up, with all that it implies. I felt sure that Christianity would be challenged and that the Jews would be taken to account. I therefore tried to start the discussion in order to forestall the inevitable violence of the unconscious outburst of which I was afraid—though not enough, as subsequent events have unfortunately shown only too clearly. I don't need to say that I was not heard at all. The fog of war-psychology was just too dense.

[1323] Germany was the first country to experience the miracles worked by democracy's ghost, the State. She saw her money becoming elastic and expanding to astronomical proportions and then evaporating altogether. She experienced all in one heap what the ghosts of other democracies are trying to do to us in a sort of slow-motion picture, probably hoping that nobody understands the eyewash. Germany got it right in the neck and there was no joke about it. The whole educated middle class was utterly ruined, but the State was on top, putting on more and more of the "-istic" rouge as war-paint. The country was in a condition of extreme misery and insecurity, and waves of panic swept over the population. In an individual case these are the symptoms of an oncoming outburst. Any such outburst would bring up archaic material, archetypes that join forces with the individual as well as with the people. There is some teleology about this: it creates strength where there was weakness, conviction instead of doubt, courage instead of fear. But the energy needed to bring about such a transformation is taken away from many old values and the success gained is paid for dearly. Such an outburst is always a regression into history and it always means a lowering of the level of civilization.

[1324] Through Communism in Russia, through National Socialism in Germany, through Fascism in Italy, the State became all-powerful and claimed its slaves body

and soul. Democracy became its own mirror-image, its own ghost, while the ghost became appallingly real, an all-embracing mystical presence and personality that usurped the throne a pious theocratic Christianity had hoped God would take. The old totalitarian claim of the *Civitas Dei* is now voiced by the State: one sheep as good as another and the whole herd crowded together, guarded by plain-clothed and uniformed wolf-dogs, utterly deprived of all the rights which the man on the island who called himself a democracy had dreamt of. There are no rights left, only duties. Every source of energy, industry, commerce, money, even private enterprise, is sucked up into the new slave-owner, the State.

[1325] And a new miracle happened. Out of nowhere certain men came, and each of them said like Louis XIV, “L’état c’est moi.” They are the new leaders. The State has proved its personal reality by incarnating itself in men that came from Galilee, inconspicuous nobodies previously, but equipped with the great spirit voice that cowed the people into soundless obedience. They are like Roman Caesars, usurpers of empires and kingdoms, and like those incarnations of a previously invisible deity devoutly invoked and believed in by everybody. They are the State that has superseded the medieval theocracy.

[1326] This process of incarnation is particularly drastic in Hitler’s case. Hitler himself as an ordinary person is a shy and friendly man with artistic tastes and gifts. As a mere man he is inoffensive and modest, and has nice eyes. But he comes from Braunau, a little town that has already produced two famous mediums—the Schneider brothers. (Harry Price has written a book about one of them.⁶) Hitler is presumably the third and the most efficient medium from Braunau. When the State-spirit speaks through him, he sends forth a voice of thunder and his word is so powerful that it sweeps together crowds of millions like fallen autumn leaves.

[1327] There is obviously no power left in the world and particularly no State-loving “-ism” which is capable of resisting this incredible force. Of course you will say, as everybody does, “One must be a German to understand such miracles.” Yes, this is just as true as that you must be an Italian to understand the mythology of the Fascio, or a Russian to appreciate the charms of Stalin’s paternal regime. Of course you can’t understand those funny foreigners, Sir Oswald Mosley and Colonel de la Rocque⁷ being still babes in arms. But if you carefully study what President Roosevelt is up to and what the famous N.R.A.⁸ meant to the world of American commerce and industry, then you get a certain idea of how near the great State in America is to becoming Roosevelt’s incarnation. Roosevelt is the stuff all right, only the circumstances are not bad enough. Great Britain seems to be pretty conservative, yet you have a taxation which makes the great estates uninhabitable. That is exactly how things began in Italy. You have devalued your money, this is the second step. You could not stop the boastful march of Roman legions through the bottleneck of Suez,

and Sir Samuel⁹ meekly and wisely took all the air out of that magnificent gesture of a proud British fleet adorning the entrance to Italy's triumph. This was the third step. England comes perhaps so late into the paradise of a new age that she arrives there with many old-world values well preserved by sheer lack of interest. Being Swiss I heartily sympathize with this attitude. Knowing of nothing that would be better, we hang on to the rear of events and muddle along as we have been used to do for six hundred years. We can't imagine our dictator yet, but already an unfortunate majority believes in the mighty ghost to whom we have sacrificed all our railways and the gold standard on top of that.

[1328] The incarnation of the State-ghost is no mean affair. It competes with famous historical parallels; it even challenges them. Just as Christianity had a cross to symbolize its essential teaching, so Hitler has a swastika, a symbol as old and widespread as the cross. And just as it was a star over Bethlehem that announced the incarnation of God, so Russia has a red star, and instead of the Dove and the Lamb a hammer and sickle, and instead of the sacred body a place of pilgrimage with the mummy of the first witness. Even as Christianity challenged the Roman Imperium, enthroned ambitious Roman bishops as *Pontifices Romani*, and perpetuated the great Empire in the theocracy of the Church and the Holy Roman Empire, so the Duce has produced once more all the stage scenery of the Imperium which will soon reach from Ethiopia to the Pillars of Hercules as of old.

[1329] Again it is Germany that gives us some notion of the underlying archetypal symbolism brought up by the eruption of the collective unconscious. Hitler's picture has been erected upon Christian altars. There are people who confess on their tombstones that they died in peace since their eyes had beheld not the Lord but the Führer. The onslaught on Christianity is obvious; it would not even need corroboration through a neo-pagan movement incorporating three million people. This movement can only be compared with the archetypal material exhibited by a case of paranoid schizophrenia. You find in neo-paganism the most beautiful Wotanistic symbolism, Indogermanic speculation, and so on. In North Germany there is a sect that worships Christ in the form of a rider on a white horse.¹⁰ It does not go as far as collective hallucinations, though the waves of enthusiasm and even ecstasy are running high.

[1330] Nations in a condition of collective misery behave like neurotic or even psychotic individuals. First they get dissociated or disintegrated, then they pass into a state of confusion and disorientation. As it is not a question of psychotic disintegration in an individual case, the confusion affects mainly the conscious and subconscious layers but does not touch the fundamental instinctual structure of the mind, the collective unconscious. On the contrary, the confusion in the top layers produces a compensatory reaction in the collective unconscious, consisting of a

peculiar personality surrogate, an archaic personality equipped with superior instinctive forces. This new constellation is at first completely unconscious, but as it is activated it becomes perceptible in the form of a projection. It is usually the doctor treating a patient who unwittingly assumes the role of the projected figure. The mechanism of this projection is the transference. By transference the doctor appears in the guise of the father, for instance, as that personality who symbolizes superior power and intelligence, a guarantee of security and a protection against overwhelming dangers. So long as the disintegration has not reached the deeper layers, the transference will not produce more than the projection of the father-image. But once the confusion has stirred up these unknown depths, the projection becomes more collective and takes on mythological forms. In this case the doctor appears as a sort of sorcerer or saviour. With actively religious persons the doctor would be superseded by an activated image of Christ or by that of an invisible divine presence.

[1331] Mystical literature abounds in descriptions of such experiences. You also find detailed records in William James' *Varieties of Religious Experience*. But if you observe the dreams of such patients you will find peculiar symbolic images, often long before the patients themselves become conscious of any so-called mystical experiences. These images always show a specific pattern: they are circular or square, or like a cross or a star, or are composites of such elements. The technical term I use for such figures is the *mandala*, the Sanskrit word for "circle."¹¹ The corresponding medieval Latin term is the *circulus quadratus* or *rosa*. In Hindu literature you also find the terms *padma* (lotus) and *chakra*, meaning the flowerlike centres of different localizations of consciousness.¹²

[1332] Because of its circular form the mandala expresses roundness, that is, completeness or integration. In Tantrism and Lamaism it is used as an instrument of concentration and as a means of uniting the individual consciousness, the human ego-personality, with the superior divine personality of the non-ego, i.e., of the unconscious. Mandalas often have the character of *rotating* figures. One such figure is the swastika. We may therefore interpret it as a projection of an unconscious collective attempt at the formation of a compensatory unified personality. This unconscious attempt plays a great role in the general personification of the State. It gives it its ghostlike quality and bestows upon it the faculty of incarnating itself in a human personality. The almost personal authority and apparent efficiency of the State are, in a sense, nothing else than the unconscious constellation of a superior instinctual personality which compensates the obvious inefficiency of the conscious ego-personality.

[1333] When Nietzsche wrote his prophetic masterpiece, *Thus Spake Zarathustra*, he certainly had not the faintest notion that the superman he had created out of his personal misery and inefficiency would become a prophetic anticipation of a Führer

or Duce. Hitler and Mussolini are more or less ordinary human beings, but ones who, curiously enough, assume that they themselves know what to do in a situation which practically nobody understands. They seem to have the superhuman courage or the equally superhuman recklessness to shoulder a responsibility which apparently nobody else is willing or able to carry. Only a superman could be entrusted with faculties that are equal to the difficulties of the actual situation. But we know that mystical experience as well as identification with an archetypal figure lend almost superhuman force to the ordinary man. Not in vain do the Germans call their Führer “our Joan of Arc.” He is very much the character that is open to unconscious influences. I am told that Hitler locked himself in his room for three days and nights when his whole staff beseeched him not to leave the League of Nations. When he appeared again he said without any explanation, “Gentlemen, Germany must leave the League.” This story sounds as if German politics were not made but revealed.

[1334] Hitler’s unconscious seems to be female. Mussolini’s Latin and very masculine temperament does not allow a comparison with Hitler. As an Italian he is imbued with Roman history, and indeed in every gesture he betrays his identity with the Caesar. It is most characteristic what rumour has to say about him. I am told—I don’t know whether there is any truth in it or not—that not very long ago he appeared at a reception in the Roman toga and the golden laurel wreath of the Caesar, creating a panic that could only be hushed up by the most drastic measures. Even if this is a mere legend it shows beautifully how rumour interprets the Duce’s role. Gossip is surely a bad thing, but I confess I always find it interesting because it is often the only means of getting information about a public figure. Gossip does not need to be true in order to be of value. Even if it gives an entirely twisted picture of a man, it clearly shows the way in which his persona, that is his public appearance, functions. The persona is never the true character; it is a composite of the individual’s behaviour and of the role attributed to him by the public.¹³ Most of the biography of a public figure consists of the persona’s history and often of very little individual truth. Well, this is the penalty the man in the limelight has to pay!

[1335] It seems as if in nearly all the countries of Europe the gulf between the right and left wing were widening, in so far as these countries are not already Fascist. It is so in Spain and it soon might be as obvious in France. Since Socialism and Communism merely enhance the attributes of democracy, i.e., of a Constitution where there is a ruler without subjects and subjects without a ruler, they only serve to hollow out the meaning of Parliament, of government, of money, and of the so-called rights of the free citizen. The only possible synthesis seems to be the eventual incarnation of the State-ghost in a superman with all his mythological paraphernalia. Recently Ramsay MacDonald made a very clear statement. Speaking of the Labour Party he literally said: “Its members are a flock without a shepherd and with a plethora of sheep-dogs

in disagreement with one another about the fold in which the flock should be penned. Is it not time for Labour policy to be realistic? By its fumbling with the cardinal issues of defence and peace, it is casting doubt on the competence of democracy and playing straight into the hands of Fascism. The problems of modern life are too urgent to remain the playthings of shortsighted partisans.”¹⁴

[1336] It is doubtful whether the European nations would remain for any length of time in the chaotic disorder of the childish Communistic doctrine. They rather revert to type, to a state of enforced order which is nothing else than dictatorship and tyrannical oligarchy. At least this form has come to light even in sluggish Russia, where 170 million people are kept in order by a few million members of the Communist Party. In Italy it is the Fascio, and in Germany the S.S. is fast on the way to becoming something like a religious order of knights that is going to rule a colony of sixty million natives. In the history of the world there has never been a case where order was established with sweet reasonableness in a chaos. Chaos yields only to enforced order.

[1337] In the dictator and his oligarchical hierarchy the State-ghost appears in the flesh. Yet such statesmen are human beings who assume power over their fellow beings, and instantly the latter feel suppressed, which they did not feel as long as they were called democrats. Of course this State slavery is just as bad as before, but now they remember they might have to say something political and are told to shut up. Then they feel as if something dreadful had happened to them. They don't realize that whatever they talked about in the democracy was just as futile as anything they might talk about now. It is true that democrats talk and socialists talk more and communists beat them all at talk. It is just that sort of thing that has led them to disintegration, and that's why in a condition of enforced order talk comes abruptly to an end.

[1338] Disorder is destructive. Order is always a cage. Freedom is the prerogative of a minority and it is always based on the disadvantage of others. Switzerland, the oldest democracy in the world, calls herself a free country because no foreigner ever enjoyed a liberty to her disadvantage until America and Great Britain went off the gold standard. Since then we have felt like victims. Now we play the same trick on the other countries that hold Swiss bonds (mind you, Switzerland is the third biggest banker in Europe!) and we probably feel better for it. But are we really free? We are weak and unimportant and we try to be so; our style of life is narrow and our outlook hampered not only by ordinary hills but by veritable mountains of prejudice against anything and everybody that exceeds our size. We are locked in the cage of order and we enjoy just enough air not to suffocate. We have one virtue yet: we are modest and our ambitions are small. That is why we can stick to order and why we don't believe much in talk. But our freedom is exceedingly limited—fortunately enough. It may save us from a dictator.

[1339] In continental Europe today, I am afraid it is hardly a question of whether we are going to enjoy more freedom or less. As a matter of fact things have gone so far that soon even the problem of freedom will be obsolete. The question is rather that of “to be or not to be.” The dilemma is now between chaos and enforced order. Will there be civil war or not? — that is what we anxiously ask the dark Fates of Europe. I would like to quote here Miguel de Unamuno, one of those Spanish liberals who undermined the traditional order in the hope of creating greater freedom. Here is his most recent confession: “Times have changed. It is not any more a question of Liberalism and Democracy, Republic or Monarchy, Socialism or Capitalism. It is a question of civilization and barbarity. Civilization is now represented in Spain by General Franco’s Army.”¹⁵

[1340] Compulsory order seems to be preferable to the terrors of chaos, at all events the lesser of two great evils. Orders, I am afraid, have to be heard in silence.

[1341] But there is a majority of people to whom it seems the most serious matter in the world when they can’t talk any more. This appears to be the reason why even the most []¹⁶ dictatorships are eventually talked out of existence, and why the senseless and lamentable gamble of politics is meandering its way through history—a sad comedy to the thinking mind and to the feeling heart.

[1342] If we are stumbling into an era of dictators, Caesars, and incarnated States, we have accomplished a cycle of two thousand years and the serpent has again met with its own tail. Then our era will be a near replica of the first centuries A.D., when Caesar was the State and a god, and divine sacrifices were made to Caesar while the temples of the gods crumbled away. You know that thousands in those days turned their eyes away from this visible world, filled with horror and disgust, and adopted a philosophy which healed their souls. Since history repeats itself and the spiral of evolution seemingly returns to the point where it took off, there is a possibility that mankind is approaching an epoch when enough will be said about things which are never what we wish them to be, and when the question will be raised why we were ever interested in a bad comedy.

RETURN TO THE SIMPLE LIFE¹

What are your views on a return of the Swiss people to the simple life?

[1300] The return to the simple life can be regarded as an unhoped-for piece of good fortune even though it demands considerable self-sacrifice and is not undertaken voluntarily. Thanks to the mass media and the cheap sensationalism offered by the cinema, radio, and newspapers, and thousands of amusements of all kinds, life in the recent past has rapidly been approaching a condition that was not far removed from the hectic American tempo. Indeed, in the matter of divorces, Zurich has already reached the American record. All time-saving devices, amongst which we must count easier means of communication and other conveniences, do not, paradoxically enough, save time but merely cram our time so full that we have no time for anything. Hence the breathless haste, superficiality, and nervous exhaustion with all the concomitant symptoms—craving for stimulation, impatience, irritability, vacillation, etc. Such a state may lead to all sorts of other things, but never to any increased culture of the mind and heart.

Do you think we should turn more and more to the treasures of our culture?

[1344] As the booming book trade in many countries shows, if the worst comes to the worst people will even turn to a good book. Unfortunately, such a decision always needs a compelling external cause. Unless driven by necessity, most people would never dream of “turning to the treasures of our culture.” The delusion of steady social improvement has been dinned into them so long that they want to forget the past as quickly as possible so as not to miss the brave new world that is constantly being dangled before their eyes by unreformable world-reformers. Their neurasthenic craving for the latest novelty is a sickness and not culture. The essence of culture is continuity and conservation of the past; craving for novelty produces only anti-culture and ends in barbarism. The inevitable outcome is that eventually the whole nation will yearn for the very culture which, owing to the delusion of better conditions in the future (which seldom if ever materialize), has almost (or entirely) disappeared. Unfortunately our world, or perhaps the moral structure of man, is so constituted that no progress and no improvement are consistently good, since sooner or later the corresponding misuse will appear which turns the blessing into a curse. Can anyone seriously maintain that our wars are in any way “better” than those of the Romans?

[1345] The craze for mass organization wrenches everyone out of his private world into the deafening tumult of the market-place, making him an unconscious, meaningless particle in the mass and the helpless prey of every kind of suggestion. The never failing bait is the alleged “better future,” which prevents him from adapting himself to the actual present and making the best of it. He no longer lives in the present and *for* the future, but—in a totally unrealistic way—already in the future, defrauded of the present and even more of the past, cut off from his roots, robbed of his continuity, and everlastingly duped by the mocking *fata morgana* of a “better future.” A tremendous disillusionment is needed to save people from wishful thinking and bring them back to the sound bases of tradition, and to remind them of the blessings of a spiritual culture which the “age of progress” has destroyed with its nihilistic criticism. One has only to think of the spiritual devastation that has already been wrought by materialism, the invention of would-be intellectuals equipped with truly infantile arguments. It will be difficult to get rid of the kind of thinking whose very stupidity makes it so popular.

Do you believe that happiness is found not in material but in spiritual things?

[1346] To remove the ideal from the material to the spiritual world is a tricky business, because material happiness is something tangible (if ever it is attained), and the spirit an invisible thing which it is difficult to find or to demonstrate. It is even supposed that most of what goes by the name of “spirit” is so much empty talk and a clattering of words. An attainable sausage is as a rule more illuminating than a devotional exercise; in other words, to find happiness in the spirit one must be possessed of a “spirit” to find happiness in. A life of ease and security has convinced everyone of all the material joys, and has even compelled the spirit to devise new and better ways to material welfare, but it has never *produced* spirit. Probably only suffering, disillusion, and self-denial do that. Anyone who can live under such stresses and still find life worth while already has spirit, or at least has some inklings of it. But at all times there are only very few who are convinced from the bottom of their hearts that material happiness is a danger to the spirit, and who are able to renounce the world for its sake.

[1347] I hope, therefore, that the scourge which is now lashing Europe will bring the nations to realize that this world, which was never the best of all possible worlds in the past, will not be so in the future either. It is, as always, compounded of day and night, light and darkness, brief joys and abiding sorrows, a battleground without respite or peace, because it is nothing but the melting-pot of human desires. But the spirit is another world within this world. If it is not just a refuge for cowards, it comes only to those who *suffer* life in this world and accept even happiness with a gesture of polite doubt. Had the Christian teachings not been so utterly forgotten in the face of all this technological “progress,” the avalanches that now threaten to

engulf Europe would never have started rolling. Belief in this world leaves room neither for the spirit of Christianity nor for any other good spirit. The spirit is always hidden and safe from the world, an inviolable sanctuary for those who have forsworn, if not the world, at least their belief in it.

Can there be an optimism of austerity?

[1348] Instead of “optimism,” I would have said an “optimum” of austerity. But if “optimism” is really meant, very much more would be required, for “austerity” is anything but enjoyable. It means real suffering, especially if it assumes acute form. You can be “optimistic” in the face of martyrdom only if you are sure of the bliss to come. But a certain minimal degree of austerity I regard as beneficial. At any rate, it is healthier than affluence, which only a very few people can enjoy without ill effects, whether physical or psychic. Of course one does not wish anything unpleasant for anybody, least of all oneself, but, in comparison with other countries, Switzerland has so much affluence to spare (however honourably earned) that we are in an excellent position to give some of it away. There is an “optimum” of austerity which it is dangerous to exceed, for too much of it does not make you good but hard and bitter. As the Swiss proverb trenchantly puts it: “Behind every rich man stands a devil, and behind every poor man two.”

[1349] Since “optimism” seems to have been meant, and hence an optimistic attitude towards something unpleasant, I would add that in my view it would be equally instructive to speak of a “pessimism” of austerity. Human temperaments being extremely varied, indeed contradictory, we should never forget that what is good for one man is harmful for another. One man, because of his inner weakness, needs encouragement; another, because of his inner assurance, needs the restraint of austerity. Austerity enforces simplicity, which is true happiness. But to live simply, without regret and bitterness, is a moral task which many people will find very hard.

Will turning away from material things foster the team-spirit?

[1350] A common need naturally strengthens the team-spirit, as we can see in England at this moment. But the very existence of many moral weaklings increases the danger of selfishness. All extraordinary conditions bring men’s badness as well as their goodness to light. However, since the majority of our people may be regarded as morally healthy, there is ground for hope that a common need will cause their virtues to shine more brightly.

[1351] Believing as I do in the virtues and diligence of the Swiss, I am convinced that they have an absolute will to preserve their national independence and are ready to make the heaviest sacrifices. At any rate, the team-spirit in Switzerland is not undeveloped and hardly needs special strengthening. Above all, we do not have those

social contrasts between a solid upper crust or party on the one hand and an anonymous mass on the other, which in other countries keep citizens apart. Class conflicts with us are mainly imported from abroad. Instead of pushing the team-spirit artificially to the fore, it seems to me more important to stress the development of the personality, since this is the real vehicle of the team. Faced with the question of *what* a man does, one should never forget *who* is doing it. If a community consists of nothing but trash, then it amounts to nothing, for a hundred imbeciles still do not add up to anything sensible. The noisy and insistent preaching of the team-spirit only causes them to forget that their contribution to society consists of nothing but their own uselessness. If I belong to an organization with 100,000 members it does not prove in the least that I am any good, let alone if there are millions of them. And if I pat myself on the back for being a member, I am merely adding to my non-value the illusion of excessive value. Since, in accordance with the laws of mass psychology, even the best man loses his value and meaning in the mass, it is doubly important for him to be in secure possession of his good qualities in order not to damage the community of which he is a member. Instead of talking so much about the team-spirit it would be more to the point to appeal to the spiritual maturity and responsibility of the individual. If a man is capable of leading a responsible life himself, then he is also conscious of his duties to the community.

[1352] We Swiss believe in quality; let us therefore use our national belief for improving the value of the individual, instead of letting him become a mere drop in the ocean of the community. Self-knowledge and self-criticism are perhaps more necessary for us in Switzerland, and more important for the future, than a great herd of social irresponsibles. In Switzerland we could do nothing anyway with masses welded together and controlled by iron discipline; our country is far too small. What counts with us are the virtues, the stoutheartedness and toughness of the individual who is conscious of himself. In the case of extreme necessity everyone has to do his bit in his allotted place. It is nice to hope for a helper in time of need, but self-reliance is better. The community is not anything good in itself, as it gives countless weaklings a wonderful opportunity to hide behind each other and palm off their own incompetence on their fellows. People are only too willing to expect the community to do what they themselves are incapable of doing, and they hold it responsible when they as individuals fail to fulfil their necessary obligations.

[1353] Although we Swiss do undoubtedly have a fairly well-developed team-spirit, most of our attempts at community are miserable specimens. They grow on stony ground and are divided by thorny hedges. One and all suffer from the Swiss national vices of obstinacy and mistrustfulness—at least, these national qualities are called vices when people get annoyed about them, as very often happens. But from another point of view they could almost be extolled as virtues. It is quite impossible to say

how much of our political, intellectual, and moral independence of the powerful world around us we owe to these unpleasant qualities. Fortunately—I am almost inclined to say—their roots penetrate into the deepest recesses of every Swiss heart. We are not easily fooled. How many poisonous infections, how many fantastic ideas may we not have avoided in the course of the centuries thanks to these qualities! The fact that we are in some respects a hundred years behind the times, and that many reforms are desperately overdue, is the price we have to pay for such useful national failings.

[1354] Hence I expect more from the Swiss national character than from an artificially fostered team-spirit, because it has deeper roots in our native soil than an enthusiasm which wanes with the words that conjure it up. It is all very fine to be swept along on a tide of enthusiasm, but one cannot enthuse indefinitely. Enthusiasm is an exceptional state, and human reality is made up of a thousand vulgarities. Just what these are is the decisive thing. If the ordinary Swiss makes very sure that he himself has it good and can summon up no enthusiasm whatever for the joys of having nothing in glorious solidarity with everybody else, that is certainly unromantic—worse, it is selfish, but it is sound instinct. The healthy man does not torture others—generally it is the tortured who turn into torturers. And the healthy man also has a certain amount of goodness which he is the more inclined to expend since he does not enjoy a particularly good conscience on account of his obvious selfishness. We all have a great need to be good ourselves, and occasionally we like to show it by the appropriate actions. If good can come of evil self-interest, then the two sides of human nature have cooperated. But when in a fit of enthusiasm we begin with the good, our deep-rooted selfishness remains in the background, unsatisfied and resentful, only waiting for an opportunity to take its revenge in the most atrocious way. Community at all costs, I fear, produces the flock of sheep that infallibly attracts the wolves. Man's moral endowment is of so dubious a nature that a stable condition seems possible only when every sheep is a bit of a wolf and every wolf a bit of a sheep. The truth is that a society is more secure the more the much maligned instincts can, of their own accord, start off the counterplay of good and evil. "Pure good" and "pure evil" are both superhuman excesses.

[1355] Although there is naturally no need to preach self-interest, since it is omnipresent, it should not be needlessly slandered; for when the individual does not prosper neither does the whole. And when he is driven to unnatural altruism, self-interest reappears in monstrous, inhuman form—"changing shape from hour to hour, I employ my savage power"²—for the instincts cannot be finally suppressed or eradicated. Excessive sacrifice of the individual for the sake of the community makes no sense in our case anyway, since, our country being so small, we are in no position

to assert our self-interest in nationalistic form, that is, by the conquest of foreign countries.

[1356] In sober scepticism as opposed to propaganda talk, in sure instinct and closeness to nature, in self-limitation grounded in self knowledge, I see more health for our Fatherland than in fervent speeches about regeneration and hysterical attempts at a reorientation. Sooner or later it will be found that nothing really “new” happens in history. There could be talk of something really novel only if the unimaginable happened: if reason, humanity, and love won a lasting victory.

EPILOGUE TO JUNG: "L'HOMME À LA DÉCOUVERTE DE SON ÂME"¹

[1357] The fundamental concepts of my psychology have been set forth in the course of this book. Helped by the perceptive translation of M. Cahen-Salabelle, the reader will not have failed to take note that this psychology does not rest on academic postulates, but on my experiences of man, in health and in sickness. That is why it could not be confined to a study of the contents and functions of consciousness: it had to concern itself also with that part of the psyche we call the unconscious. Everything we say about the unconscious should be taken with a grain of salt; we have only indirect evidence for its existence since it is not open to direct observations; whatever conceptions we form of it are but logical deductions from its effects. These deductions possess only a hypothetical validity because it cannot be determined beforehand whether the nature of the unconscious can be adequately grasped by the conscious mind. I have always endeavoured, therefore, to find a formulation which brings together in a logical relationship the greatest possible number of observed facts, or else, on the basis of my knowledge of a given psychic state, to predict its probable future development, which is also a method for proving the correctness of a given hypothesis. Many a medical diagnosis, as we know, can hardly be proved right at the moment the doctor formulates it, and can be confirmed only when the disease takes its predicted course. It is in this way that my views concerning the unconscious have little by little been built up.

[1358] It is my conviction that the investigation of the psyche is the science of the future. Psychology is the youngest of the sciences and is only at the beginning of its development. It is, however, the science we need most. Indeed, it is becoming ever more obvious that it is not famine, not earthquakes, not microbes, not cancer but man himself who is man's greatest danger to man, for the simple reason that there is no adequate protection against psychic epidemics, which are infinitely more devastating than the worst of natural catastrophes. The supreme danger which threatens individuals as well as whole nations is a *psychic danger*. Reason has proved itself completely powerless, precisely because its arguments have an effect only on the conscious mind and not on the unconscious. The greatest danger of all comes from the masses, in whom the effects of the unconscious pile up cumulatively and the reasonableness of the conscious mind is stifled. Every mass organization is a latent danger just as much as a heap of dynamite is. It lets loose effects which no man wants and no man can stop. It is therefore in the highest degree desirable that a knowledge of psychology should spread so that men can understand the source of the

supreme dangers that threaten them. Not by arming to the teeth, each for itself, can the nations defend themselves in the long run from the frightful catastrophes of modern war. The heaping up of arms is itself a call to war. Rather must they recognize those psychic conditions under which the unconscious bursts the dykes of consciousness and overwhelms it.

[1359] It is my hope that this book will help to throw light on this fundamental problem for mankind.

MARGINALIA ON CONTEMPORARY EVENTS¹

[1360] Until a few centuries ago those regions of the world which have since been illuminated by science were shrouded in deepest darkness. Nature was still in her original state, as she had been from time immemorial. Although she had long since been bereft of gods, she had not by any means been *de-psychized*. Demonic spirits still haunted the earth and water, and lingered in the air and fire; witchcraft and prophecies cast their shadows over human relationships, and the mysteries of faith descended deep into the natural world. In certain flowers there could be found images of the martyrs' instruments of torture, and of Christ's blood; the clockwise spiral of the snail's shell was a proof of the existence of God; in alchemy the Virgin birth was figured in the awakening of the *infans mercurialis* in the womb of the earth; Christ's passion was represented by the *separatio*, *solutio*, and *digestio* of the arcane substance; his death and resurrection were reproduced in the processes of chemical transformation. These depicted the otherwise unimaginable transubstantiation. The secret of the baptismal water was rediscovered in the marvellous properties of the solvent *par excellence*, the ὕδωρ θεῖον or *aqua permanens*. Christ's crucifixion was like a prefiguration of the task of natural science, for the tree of the Cross corresponded to the *arbor philosophica*, which in turn stood for the *opus alchymicum* in general.

[1361] Today we can scarcely imagine this state of mind any more, and we can form no proper conception of what it meant to live in a world that was filled from above with the mysteries of God's wonder, down to the very crucible of the smelter, and was corrupted from below by devilish deception, tainted by original sin, and secretly animated by an autochthonous demon or an *anima mundi*—or by those “sparks of the World Soul” which sprang up as the seeds of life when the Ruach Elohim brooded on the face of the waters.

[1362] One can scarcely imagine the unspeakable change that was wrought in man's emotional life when he took farewell from that almost wholly antique world. Nevertheless, anyone whose childhood was filled with fantasy can feel his way back to it to a certain extent. Whether one laments or welcomes the inevitable disappearance of that primordial world is irrelevant. The important thing is the question that nobody ever asks: What happens to those figures and phantoms, those gods, demons, magicians, those messengers from heaven and monsters of the abyss, when we see that there is no mercurial serpent in the caverns of the earth, that there are no dryads in the forest and no undines in the water, and that the mysteries of faith

have shrunk to articles in a creed? Even when we have corrected an illusion, it by no means follows that the psychic agency which produces illusions, and actually needs them, has been abolished. It is very doubtful whether our way of rectifying such illusions can be regarded as valid. If, for example, one is content to prove that there is no whale that could or would like to swallow a Jonah, and that, even if it did, a man would rapidly suffocate under those conditions and could not possibly be spewed forth alive again—when we criticize in this way we are not doing justice to the myth. Indeed, such an argument is decidedly ridiculous because it takes the myth literally, and today this seems a little bit too naïve. Already we are beginning to see that enlightened correction of this kind is painfully beside the point. For it is one of the typical qualities of a myth to fabulate, to assert the unusual, the extraordinary, and even the impossible. In the face of this tendency, it is quite inappropriate to trot out one's elementary-school knowledge. This sort of criticism does nothing to abolish the mythologizing factor. Only an inauthentic conception of the myth has been corrected. But its real meaning is not touched, even remotely, and the mythologizing psychic factor not at all. One has merely created a new illusion, which consists in the belief that what the myth says is not true. Any elementary-school child can see that. But no one has any idea of what the myth is really saying. It expresses psychic facts and situations, just as a normal dream does or the delusion of a schizophrenic. It describes, in figurative form, psychic facts whose existence can never be dispelled by mere explanation. We have lost our superstitious fear of evil spirits and things that go bump in the night, but, instead, are seized with terror of people who, possessed by demons, perpetrate the frightful deeds of darkness. That the doers of such deeds think of themselves not as possessed, but as “supermen,” does not alter the fact of their possession.

[1363] The fantastic, mythological world of the Middle Ages has, thanks to our so-called enlightenment, simply changed its place. It is no longer incubi, succubi, wood-nymphs, melusines, and the rest that terrify and tease mankind; man himself has taken over their role without knowing it and does the devilish work of destruction with far more effective tools than the spirits did. In the olden days men were brutal, now they are dehumanized and possessed to a degree that even the blackest Middle Ages did not know. Then a decent and intelligent person could still—within limits—escape the devil's business, but today his very ideals drag him down into the bloody mire of his national existence.

[1364] The development of natural science as a consequence of the schism in the Church continued the work of the dedeification of Nature, drove away the demons and with them the last remnants of the mythological view of the world. The result of this process was the gradual dissolution of projections and the withdrawal of projected contents into the human psyche. Thus the rabble of spooks that were

formerly outside have now transported themselves into the psyche of man, and when we admire the “pure,” i.e., depsychized, Nature we have created, we willy-nilly give shelter to her demons, so that with the end of the Middle Ages *anno* 1918 the age of total blood baths, total demonization, and total dehumanization could begin. Since the days of the Children’s Crusade, of the Anabaptists and the Pied Piper of Hamelin, no such psychic epidemics have been seen, especially not on a national scale. Even the torture chamber—that staggering achievement of modern times!—has been reintroduced into Europe. Everywhere Christianity has proved incapable² of stopping the abomination, although many Christians have set their lives at stake. Finally, the invention of human slaughterhouses—compared with which the Roman circuses of 2,000 years ago were but a piffling prelude—is a scarcely surpassable achievement of the neo-German spirit.

[1365] These facts make one think. The demonism of Nature, which man had apparently triumphed over, he has unwittingly swallowed into himself and so become the devil’s marionette. This could happen only because he believed he had abolished the demons by declaring them to be superstition. He overlooked the fact that they were, at bottom, the products of certain factors in the human psyche. When these products were unreal and illusory, their sources were in no way blocked up or rendered inoperative. On the contrary, after it became impossible for the demons to inhabit the rocks, woods, mountains, and rivers, they used human beings as much more dangerous dwelling places. In natural objects much narrower limits were drawn to their effectiveness: only occasionally did a rock succeed in hitting a hut, only rarely was it possible for a river to overflow its banks, devastate the fields, and drown people. But a man does not notice it when he is governed by a demon; he puts all his skill and cunning at the service of his unconscious master, thereby heightening its power a thousandfold.

[1366] This way of looking at the matter will seem “original,” or peculiar, or absurd, only to a person who has never considered where those psychic powers have gone which were embodied in the demons. Much as the achievements of science deserve our admiration, the psychic consequences of this greatest of human triumphs are equally terrible. Unfortunately, there is in this world no good thing that does not have to be paid for by an evil at least equally great. People still do not know that the greatest step forward is balanced by an equally great step back. *They still have no notion of what it means to live in a de-psychized world.* They believe, on the contrary, that it is a tremendous advance, which can only be profitable, for man to have conquered Nature and seized the helm, in order to steer the ship according to his will. All the gods and demons, whose physical nothingness is so easily passed off as the “opium of the people,” return to their place of origin, Man, and become an intoxicating poison compared with which all previous dope is child’s play. What is

National Socialism³ except a vast intoxication that has plunged Europe into indescribable catastrophe?

[1367] What science has once discovered can never be undone. The advance of truth cannot and should not be held up. But the same urge for truth that gave birth to science should realize what progress implies. Science must recognize the as yet incalculable catastrophe which its advances have brought with them. The still infantile man of today has had means of destruction put into his hands which require an immeasurably enhanced sense of responsibility, or an almost pathological anxiety, if the fatally easy abuse of their power is to be avoided. The most dangerous things in the world are immense accumulations of human beings who are manipulated by only a few heads. Already those huge continental blocs are taking shape which, from sheer love of peace and need of defence, are preparing future catastrophes. The greater the equalized masses, the more violent and calamitous their movement!

[1368] When mankind passed from an animated Nature into an exanimated Nature, it did so in the most discourteous way: animism was held up to ridicule and reviled as superstition. When Christianity drove away the old gods, it replaced them by one God. But when science de-psychized Nature, it gave her no other soul, merely subordinating her to human reason. Under the dominion of Christianity the old gods continued to be feared for a long time, at least as demons. But science considered Nature's soul not worth a glance. Had it been conscious of the world-shattering novelty of what it was doing, it would have reflected for a moment and asked itself whether the greatest caution might not be indicated in this operation, when the original condition of humanity was abolished. If yes, then a "rite de sortie," a ceremonial proclamation to the gods it was about to dethrone, and a reconciliation with them, would have been necessary. That at least would have been an act of reverence. But science and so-called civilized man never thought that the progress of scientific knowledge would be a "peril of the soul" which needed forestalling by a powerful rite. This was presumed impossible, because such a "rite de sortie" would have been nothing but a polite kowtowing to the demons, and it was the triumph of the Enlightenment that such things as nature-spirits did not exist at all. But it was merely that what one *imagined* such spirits to be did not exist. They themselves exist all right, here in the human psyche, unperturbed by what the ignorant and the enlightened think. So much so that before our very eyes the "most industrious, efficient, and intelligent" nation in Europe could fall into a state of *non compos mentis* and put a poorly gifted housepainter, who was never distinguished by any particular intelligence but only by the use of the right means of mass intoxication, quite literally on the altar of totalitarianism, otherwise reserved for a theocracy, and leave him there. Evidently neither knowledge nor preparation of any kind is needed for the direction of the State, and without any military training one can be a great

Field Marshal. Even intelligence blanches at the sight of it and cannot but marvel at the unprecedented “genius.” It was indeed something quite out of the ordinary when a person came along and cold-bloodedly stated that *he* would take over the responsibility. It was so stupefying that nobody thought of asking *who* was accepting the responsibility, or of taking the necessary precautions against public mischief. At all events the thing promised far too much for anyone to take serious offence. The psychopathologist is familiar with this particular “genius” of irresponsible promises: it is called *pseudologia phantastica*, and it is considered quite a feat not to be duped by such people, especially when they exhibit in a high degree symptoms of possession, such as divinatory phenomena (hunches, thought-reading, etc.), and fits of pathological affect (the classic frenzy of the prophets). Nothing is so infectious as affect and nothing is so disarming as the promised fulfillment of one’s own selfish wishes. I do not dare to think of what might have happened to us Swiss if we had had the misfortune to be a nation of eighty millions. According to all the psychological precedents our stupidity would have been multiplied, and our morality divided, by twenty. The greater the accumulation of masses, the lower the level of intelligence and morality. And if any further proof were needed of this truth, the descent of Germany into the underworld would be an example. We should not delude ourselves that we would not have succumbed too. The presence of traitors in our midst shows how easily we succumb to suggestion, even without the mitigating excuse of being a nation of eighty millions.

[1369] What protected us was above all our *smallness* and the inevitable psychological consequences of this. First the *distrust* of the little man, whose one thought day and night is to ensure that the big man shall not bully or cheat him—for this, if one is small, must be expected of the big man. Hence, the more hectoring his words, the more they arouse *defiance* and *obstinacy*: “Now I certainly won’t,” says the honest citizen. Whether he is accused of being a misoneist or a conservative or a numskull has no effect on his instinctive reaction—at the moment; in the long run, however, the Swiss is so “reasonable” that he is secretly ashamed of his stolidity, his pigheadedness, his being a hundred years behind the times and consequently runs the risk of involving himself after all in the tumult of “world organization,” “living space,” “economic blocs,” or whatever the nostrums today are called. In this respect it is no mistake to be stuck in the past. It is as a rule better to postpone the future, since it is doubtful whether what comes afterwards will be so much better. Usually it is so with reservations, or not at all.

[1370] Far be it from me to encourage such nasty things as envy and stinginess, but the fact is they exist and contribute to the heightening of distrust and not wanting to get “with it.” Yet, like harmful animals, they have their uses. Naturally I don’t want to speak in favour of the bad qualities, but I enjoy studying them just because, in a

collectivity, they prove to be so much more effective than the virtues. They have the great advantage of piling up in proportion to the size of the population while the virtues have the disadvantage of extinguishing each other under the same conditions. They suffer from the same drawback as famous galleries, where the accumulated masterpieces kill each other stone dead. Virtue is jealous, but vice seeks companions (and the evil one loves large numbers, small ones he despises, and therefore occasionally overlooks them).

[1371] In times of unrest such as these, we are protected by our deep roots, by tradition, which—thank God—is still alive and cherished, by love of country, by a profound conviction that no tree ever reaches up to heaven, and that the higher it grows the closer its roots approach to hell, by a taste that likes the middle, the *μηδὲν ἄγαν* (“do nothing to excess”) of the Greek sages, who knew only their *polis* and presumably never even dreamt of a nation of eighty millions, and lastly by the aforesaid bad qualities, which we certainly don’t wish to conceal. We have had enough of this from the other side of the Rhine: “The healthiest, most industrious, most efficient, and staunchest nation”—how the fish rise to this bait! Anyone who is really convinced of his own and his nation’s imperfections will not fall for the power of the superlative, the whopping lie. He knows, or should know, that the statesman who toys with unlawful measures is ultimately working for the ruin of the nation. The demand for the probity of the nation’s leaders must be the fundamental principle of all politics, however humdrum, undiplomatic, unmodern, and short-sighted that may sound. Success that is obtained by bad means sooner or later ends in ruin. The history of the German Reich since 1871 is an object lesson in this respect. But the danger that one will learn nothing from history is great.

[1372] Just as ruinous, it seems to me, as the worship of success and the belief in superlatives is the fashionable tendency to turn man into a mere function of economic factors. Moleschott’s celebrated dictum. “Man is what he eats,” cannot claim to be even a physiological truth, for although he depends on his food, he is not what this is but how he digests it. All schemes for world improvement, world communications, economic spheres of influence, national alliances, etc., stand or fall by the way man deals with them. And if there is anyone who does not believe that even the best idea will in all probability be sabotaged by man’s notorious short-comings, by his stupidity, laziness, unscrupulousness, egotism, etc., he can safely pack up his statistical tables. Even in a system patched together out of countless compromises, and weighed down with all sorts of impractical and seemingly unnecessary historical appendages, the State will prosper tolerably well if the majority of its citizens still possess an unatrophied sense of justice. Nobody can deny the importance of economic conditions, but what is far more important is how the public reacts to their inevitable ups and downs. Over and above all external factors the ultimate decisions

always rest with the human psyche. Whether one had a large or a small “living space” matters little in comparison with whether one has a sound or a gullible psyche. In this respect the “leaders,” with sure grasp, have understood what is so crucially lacking: an unquestionable spiritual and moral authority. The pope or the Church could say they are such an authority, but how many people believe it? No doubt one *ought* to believe it, but doesn’t one always use this little word “ought” when one is forced to admit that one simply doesn’t know how the necessary remedy is to be brought about?

[1373] I think the appeal to the religious conscience of humanity no longer arouses any response worth mentioning today. The modern peddlers of poisonous intoxicants have replaced this “opium” with far more effective drugs. Nowadays it is science more than anything that is the great power for good or ill. Science has done more than usher in a new age of unbelief: it *is* that age. When anything is labelled “scientific,” you can be quite sure that it will be given a welcome hearing by everyone who values his intelligence and his intellectual reputation. Here, then, we would have a quite passable authority which has given proof not only of its iconoclastic but also of its positive powers.

[1374] For about half a century now science has been examining under the microscope something that is more invisible than the atom—the human psyche—and what it discovered at first was very far from enjoyable. If one had the necessary imagination one would actually be shattered by these discoveries. But the psychologist today is in the same position as the physicist, who has discovered the elements of a future atomic bomb capable of turning the earth into a nova. He sees it merely as an interesting scientific problem, without realizing that the end of the world has come tangibly closer. In the case of psychology things are not quite as bad as that, but all the same it has discovered where those demons, which in earlier ages dominated nature and man’s destiny, are actually domiciled, and, what is more, that they are none the worse for enlightenment. On the contrary, they are as sprightly as ever, and their activity has even extended its scope so much that they can now get their own back on all the achievements of the human mind. We know today that in the unconscious of every individual there are instinctive propensities or psychic systems charged with considerable tension. When they are helped in one way or another to break through into consciousness, and the latter has no opportunity to intercept them in higher forms, they sweep everything before them like a torrent and turn men into creatures for whom the word “beast” is still too good a name. They can then only be called “devils.” To evoke such phenomena in the masses all that is needed is a few possessed persons, or only one. Possession, though old-fashioned, has by no means become obsolete; only the name has changed. Formerly they spoke of “evil spirits,” now we call them “neuroses” or “unconscious complexes.” Here as everywhere the

name makes no difference. The fact remains that a small unconscious cause is enough to wreck a man's fate, to shatter a family, and to continue working down the generations like the curse of the Atrides. If this unconscious disposition should happen to be one which is common to the great majority of the nation, then a single one of these complex-ridden individuals, who at the same time sets himself up as a megaphone, is enough to precipitate a catastrophe. The good people, in their innocence and unconsciousness, do not know what is happening to them when they are changed overnight into a "master race" (a work of the devil, who has so often changed horse-apples into gold), and an amazed Europe is hard put to accommodate itself to the "new order" where anything so monstrous (one thinks of Maidenek⁴ in relation to Eckhart, Luther, Goethe, and Kant!) is not merely a possibility but a *fait accompli*.⁵

[1375] Countless people have asked themselves how it was possible for a civilized nation like Germany to fall into this hellish morass. I once wrote that Germany is the land of spiritual catastrophes.⁶ If the neo-German madness proclaims that the Germans are the chosen people, and if they then, out of envious rivalry, persecute the Jews with whom they have certain psychological peculiarities in common (behind every persecution there lurks a secret love, as doubt behind every fanaticism), we are indeed confronted with something quite apart, a state of being "elect." For nobody can fall so low unless he has a great depth. If such a thing can happen to a man, it challenges his best and highest on the other side; that is to say, this depth corresponds to a potential height, and the blackest darkness to a hidden light. This light is certainly invisible today, because it is blocked up in the depths of the psyche. Indeed everything has gone so desperately awry in Germany, and what has happened is an infernal caricature of the answer the German spirit should have given to the question put to Europe by a new age. Instead of reflecting on this question, it was taken in by that fake figure of the Superman, which the neurotically degenerate mind of Nietzsche invented as a compensation for his own weakness. (Not without some excuse, however, since the Faust that made the pact with the devil was his godfather.) Germany has soiled her name and her honour with the blood of the innocent and brought upon her own head the curse of election. She has aroused such hatred in the world that it is difficult to make the scales of justice balance. And yet the first to enter with the Saviour into paradise was the thief. And what does Meister Eckhart say? "For this reason God is willing to bear the brunt of sins and often winks at them, mostly sending them to people for whom he has prepared some high destiny. See! Who was dearer to our Lord or more intimate with him than his apostles? Not one of them but fell into mortal sin, and all were mortal sinners."⁷

[1376] Nowhere are the opposites wrenched further apart than in the German. He is like a sick man who has fallen a victim to his unconscious and no longer knows himself.

[1377] The psychiatrist knows that certain dangerous unconscious forces can be rendered harmless, or at least held in check, if they are made conscious, that is. if the patient can assimilate them and integrate them with his personality. In so far as psychiatrists are concerned with the psychic treatment of such complexes, they have to do every day with “demons,” i.e., with psychic factors that display demonic features when they appear as a mass phenomenon. To be sure, a bloodless operation of this kind is successful only when a single individual is involved. If it is a whole family, the chances are ten to one against, and only a miracle can provide the remedy. But when it is a whole nation the artillery speaks the final word. If this is to be avoided one must begin with the individual—and a lamentably long-drawn-out and hopeless labour of Sisyphus this may seem. At any rate people are so impressed by the suggestive power of megaphone oratory that they are inclined to believe that this bad means—mass hypnotism—could be put to a good purpose by “inflammatory” speeches, “pungent” words, and soul-stirring sermons. Though I don’t want to dismiss altogether the saying about the end justifying the means, I must emphasize that mass persuasion for the sake of the good compromises its end and aim, because at bottom it is simply a whipped-up mood whose effect peters out at the earliest opportunity. The innumerable speeches and articles on the “renewal” are futile, so much chatter that hurts nobody and bores everyone.

[1378] *If the whole is to change, the individual must change himself.* Goodness is an individual gift and an individual acquisition. In the form of mass suggestion it is mere intoxication, which has never yet been counted a virtue. Goodness is acquired only by the individual as his own achievement. No masses can do it for him. But evil needs masses for its genesis and continued existence. The mastermen of the S.S. are all, when segregated each by himself, indescribably small and ugly. But the good man shines like a jewel that was lost in the Sahara. The scientist knows that no epidemic can be sealed off by a *cordon sanitaire* unless the individual is prevented from breaking it. Nor can one hope for the cleanliness of a people unless the individual is induced to wash himself daily. Perhaps in a more enlightened era a candidate for governmental office will have to have it certified by a psychiatric commission that he is not a bearer of psychic bacilli. How much this would have spared the world had it been done before 1933!

[1379] The disinfection of the upper echelons would certainly be merely a palliative, for a real cure would consist in the immunization of individuals. The snag here is that the alteration of the individual seems to be such an infinitely long and discouraging way round. It should be remembered, however, that only two other possibilities exist. First, the undoubtedly successful method of mass suggestion, which unfortunately works best only when you want to make something slide downhill or collapse. All that can be built with it are houses of cards or concentration camps or death pits. This

method, therefore, is not to be recommended. Second, you can fold your hands in your lap, stick your head in the sand, and let things run on in God's or the devil's name. But it is extremely difficult and irritating to let a thing run on. If anything sensible came of it in the end, it would be like a *lèse-majesté* of man. So this way, too, is out.

[1380] What then remains? *Only with the individual can anything be done.* The rise and spread of Christianity show that something of the kind is not altogether impossible. Even a sceptic will have to admit that Christianity has brought about a psychic change of sorts, even if only a superficial one.⁸ It expelled many demons (and piled them up somewhere else), and it actually effected the dedeification of nature. If we disregard the mass conversions, its spread was due mainly to the work of one individual upon another. The individual was directly appealed to in early Christian times, and this appeal has continued down through the centuries in the ecclesiastical cure of souls. (In the case of Protestantism one has to ask oneself where, for sheer kerygmatics, the cure of souls has got to!) Without a personal appeal there is no personal influence, which alone can change the attitude of the individual for the better. This requires the personal commitment not only of the one to be changed, but above all of the one who wants to do the changing. Words and gestures influence only the man who is ready to go downhill and is merely waiting for the final push.

[1381] What we need are a few illuminating truths, but no articles of faith. Where an intelligible truth works, it finds in faith a willing ally; for faith has always helped when thinking and understanding could not quite make the grade. Understanding is never the handmaiden of faith—on the contrary, faith completes understanding. To educate men to a faith they do not understand is doubtless a well-meant undertaking, but one runs the risk of creating an attitude that believes everything it does not understand. This—it seems to me—unwittingly prepared the ground for the “genius of the Führer.” It is so convenient to be able to believe when one fears the effort of understanding.

[1382] The medical name for make-believe and preaching faith is suggestion therapy. It has the disadvantage of adding something to a person, or taking it away from him, without his insight and decision. Childlike faith, when it occurs naturally, is certainly a charisma. But when “joyful faith” and “childlike trust” are instilled by religious education, they are no charisma but a gift of the ambiguous gods, because they can be manipulated only too easily and with greater effect by other “saviours” as well. Hence the lament of many Germans about the shameful misuse that was made of the best qualities of the German people, their faith, their loyalty, and their idealism.

[1383] Since the Church is still the greatest institution for mass education, with nothing of comparable value to set beside it, it will probably have to consider refining its methods if it wants to appeal to the educated person. The latter is by no means a

quantité négligeable, as statistics show that what he thinks and writes percolates down to the broad masses within rather less than a generation. Thus, for example, that outstandingly stupid book by Herr Büchner, *Kraft und Stoff*,⁹ became in the course of twenty years the most-read book in the public libraries of Germany. The educated man is and remains a leader of the people, whether he knows it or not and whether he wants it or not. The people seek, despite everything, to understand. Although it was not clearly provided for in the original plan of creation that our first parents would eat of the tree of knowledge, it seems nevertheless to have happened, and since then the wheel of history cannot be turned back. The people want still more of those fruits. This is a hopeful sign, for besides stratospheric bombs and the alluring possibilities of uranium there are also, perhaps, salutary truths which instruct man on his true nature and demonstrate its dangerousness as incontestably as modern hygiene demonstrates the aetiology of typhus and virulent smallpox. At the same time, they lend renewed plausibility to an attitude which it has been the constant endeavour of all the higher religions to inculcate into humanity.

ANSWERS TO “MISHMAR” ON ADOLF HITLER¹

Eugen Kolb, Geneva correspondent of *Mishmar* (*The Daily Guardian*) of Tel Aviv, wrote to Jung on 4 September 1945 for his answers to the following questions. Jung replied on 14 September.

How do you, as a psychiatrist, judge Hitler as a “patient”?

[1384] Hitler was in my view primarily an *hysteric*. (Already in the first World War he had been officially diagnosed as such.) More particularly he was characterized by a subform of hysteria: *pseudologia phantastica*. In other words he was a “pathological liar.” If these people do not start out directly as deceivers, they are the sort of idealists who are always in love with their own ideas and who anticipate their aims by presenting their wish-fantasies partly as easily attainable and partly as having been attained, and who believe these obvious lies themselves. (Quisling, as his trial showed, was a similar case.) In order to realize their wish-fantasies *no means is too bad* for them, just because they believe they can thereby attain their beloved aim. They “believe” they are doing it for the benefit of humanity, or at least of the nation or their party, and cannot under any circumstances see that their aim is invariably egoistic. Since this is a common failing, it is difficult for the layman to recognize such cases as psychopathic. Because only a convinced person is immediately convincing (by psychic contagion), he exercises as a rule a devastating influence on his contemporaries. Almost everybody is taken in by him.

How could this “psychopath” influence whole nations to such an extent?

[1385] If his maniacal wish-system is a socio-political one, and if it corresponds to the pet ideas of a majority, it produces a psychic epidemic that swells like an avalanche. The majority of the German people were discontented and hugged feelings of revenge and resentment born of their national inferiority complex and identified themselves with the underdogs. (Hence their special hatred and envy of the Jews, who had anticipated them in their idea of a “chosen people”!)

Do you consider his contemporaries, who executed his plans, equally “psychopathic”?

[1386] Suggestion works only when there is a secret wish to fulfil it. Thus Hitler was able to work on all those who compensated their inferiority complex with social aspirations and secret dreams of power. As a result he collected an army of social

misfits, psychopaths, and criminals around him, to which he also belonged. But at the same time he gripped the unconscious of normal people, who are always naïve and fancy themselves utterly innocent and right. The majority of normal people (quite apart from the 10 per cent or so who are inferior) are ridiculously unconscious and naïve and are open to any passing suggestion. So far as lack of adaptation is a disease, one can call a whole nation diseased. But this is normal mass psychology; it is a herd phenomenon, like panic. The more people live together in heaps, the stupider and more suggestible the individual becomes.

If that is so, how can they be cured?

[1387] Education for fuller consciousness! Prevention of social herd-formations, of proletarianization and mass-mindedness! No one-party system! No dictatorship! Communal autonomy!

TECHNIQUES OF ATTITUDE CHANGE CONDUCTIVE TO WORLD PEACE¹

Memorandum to Unesco

I

[1388] Psychotherapy as it is taught and practised at the C. G. Jung Institute for Analytical Psychology, Zurich, can be described as a technique for changing the mental attitude. It is a method by which not only neuroses and functional psychoses can be treated, but also all sorts of mental and moral conflicts in normal people. It consists chiefly in the integration of unconscious contents into consciousness. As the unconscious mind complements or—more accurately—compensates the conscious attitude, it becomes of considerable practical importance when the attitude of consciousness deviates to one side to such a degree that the mental balance is upset. This is the case in neuroses and psychoses. The mental and moral conflicts of normal people show a disturbance of balance of a somewhat different kind: the conflicting opposites are both conscious, whereas in the neuroses the opposing half is mostly unconscious. But even with normal people the mental attitude is only partially based upon conscious and rational motives. Quite a number of—often decisive—motives remain unconscious.

[1389] The unconscious mind consists of:

- a. Previously conscious but forgotten or repressed contents.
- b. Subliminal elements and combinations of elements not yet conscious.
- c. Inherited instinctual patterns, so-called archetypes determining human behaviour.

All these contents and elements form together a matrix of the conscious mind, which would not be able to function without their continuous collaboration. A dissociation between conscious and unconscious immediately causes pathological disturbances. The unconscious, therefore, is a factor of the greatest biological importance. Its physiological aspect consists of the functioning of all the subcortical centres, which cannot be influenced by the will, and its psychological aspect of those dominant emotional tendencies in human nature which cannot be ruled by reason. These tendencies are exceedingly dynamic and of an ambivalent nature. If properly understood, they form a most welcome and useful support and *vis a tergo* to conscious convictions and decisions. If misunderstood or misdirected they paralyse

and blindfold people, pushing them into a mass-psychosis. It is, therefore, of vital importance in medical psychology to gain access to this reservoir of energy, and no attempt to change mental attitudes can be permanently successful without first establishing a new contact with the unconscious. Hitler's enormous psychological effect was based upon his highly ingenious method of playing on the well-known national inferiority complex of the Germans, of which he himself was the most outstanding example. A similar yet positive release of unconscious dynamism was the overwhelming expansion of Christianity in the second and third centuries, and the explosive spread of Islam in the seventh century. An instructive example of epidemic insanity was the witch-hunting mania in Germanic countries in the fifteenth century. This was the cause of a veritable campaign of enlightenment initiated by the Papal Bull *Summis desiderantes* in 1484.

[1390] It must be emphasized that "mental attitude" is a concept which does not describe or define accurately enough what we understand by this term. The attitude our method is concerned with is not only a mental but a *moral* phenomenon. An attitude is governed and sustained by a dominant conscious idea accompanied by a so-called "feeling-tone," i.e., an *emotional value*, which accounts for the efficacy of the idea. The mere idea has no practical or moral effect whatever if it is not supported by an emotional quality having as a rule an *ethical value*. More often than not a neurotic dissociation is due to the effect of an intellectual or moral idea that forms an ideal incompatible with human nature. The contrary is also true, since a dominant immoral idea suppresses the better nature of an individual. In either case the attitude is determined by mental as well as moral factors. This explains why a change of attitude is by no means an easy task, since it always involves considerable moral effort. Should this be lacking, the attitude would not really be changed and the old ways would persist under the disguise of new slogans.

[1391] The *method* can be described only in its general outlines:

- a. The patient gives an honest account of his biography.
- b. He collects his dreams and other products of the unconscious and submits them to analysis.
- c. The analytical procedure tries to establish the *context* surrounding each item of the dream, etc. This is done by collecting the associations to a given item. This part of the work is carried out chiefly by the patient.
- d. The context elucidates the incomprehensible dream-text in the same way as corrupt or mutilated texts become readable with the help of philological parallels.
- e. In this way it is possible to establish a *reading of the dream-text*. This, however, does not imply an understanding of the *dream's meaning*. Determination of its meaning is a matter of practice, i.e., the apparent meaning has to be related to and

compared with the conscious attitude. Without such a comparison it is impossible to understand the functional meaning of the dream.

f. As a rule the meaning of a dream is compensatory to the conscious attitude, i.e., it adds to the latter what was lacking in it. The dream is a *natural attempt to redress a lack of balance*, and it changes the conscious attitude to such an extent that a state of equilibrium is restored.

g. The method can be applied only in individual cases and only if the individual voluntarily submits to it.

h. A change of attitude can be brought about only when there is a motive strong enough to enforce a serious submission to the method. In pathological cases it is, as a rule, the illness itself and its intolerable consequences that provide the necessary motivation. In normal cases of conflict it is strong depression, despair, or a religious problem which enables an individual to make a sustained effort to achieve an ultimate change of attitude. A provisional or experimental application of the method rarely produces the desired effect, i.e., a complete change of attitude.

i. It is, however, possible that an earnest and conscientious person with a trained mind and a scientific education can acquire sufficient knowledge through a careful study of the existing literature to apply the method to himself to a certain extent. By this means he can at least obtain some understanding of its possibilities. But as the method is in essence a *dialectical procedure*, he will not be able to progress beyond a certain point without the help of an experienced teacher. Since the method does not involve intellectual factors only, but also feeling values and above all the important question of *human relationship*, the principle of collaboration becomes imperative.

II

[1392] The applicability and efficacy of the method described above are severely restricted to the individual. A change of attitude can be brought about this way only in the individual and through individual treatment. Moreover, one can apply this method with reasonable hope of success only to individuals endowed with a certain degree of intelligence and sound sense of morality. A marked lack of education, a low degree of intelligence and a moral defect are prohibitive. As 50 per cent of the population are below normal in one or other of these respects, the method could not have any effect on them even under ideal circumstances. Since the most intimate and delicate problems have to be confronted the moment one begins to delve into the meaning of dreams, a man's attitude cannot be changed unless he takes account of the most questionable and painful aspects of his own character. One cannot, therefore, expect much from the application of such a method to a *group*. A change of attitude never starts with a group but only with an individual.

[1393] If a number of individuals were to undergo such treatment separately, and—provided their motive was strong enough—were to experience a change of attitude, they could subsequently form a group, a *leading minority*, which might become the nucleus of a larger body of people. Their numbers could be increased

- a. by individual treatment,
- b. by suggestion through authority.

The great mass of the people is led by its suggestibility. It cannot be changed in its *attitude*, only in its *behaviour*. The latter depends upon the *authority of leaders* whose attitude has been really changed.

[1394] In this way the ideas of modern psychology have spread and in a similar way religious and all sorts of intellectual, moral, and immoral movements have gained ground. Such a development seems to be theoretically possible as long as we can be sure that the causes of human attitude are of a psychological nature and can be reached by psychological means. On the other hand we have to remember that psychology in our days is still a very young science and might be still in its cradle. We have to admit, therefore, the possibility of causal factors beyond our rational expectations.

[1395] Within the above-mentioned limits a change of attitude is something that can be taken for granted. Success is not easily attainable and the method is neither infallible nor foolproof. It requires a considerable amount of education and training of physician and teacher and a very strong motive on the part of the patient or pupil. But it is also a fact that the interest of the general public in psychology had rapidly increased in spite of the marked resistance of academic authority. Psychological ideas and concepts have spread far and wide, which is irrefutable proof of real need to know more about psychology. Under these circumstances it would not be unreasonable to consider the possibility of a wider application of the said method.

[1396] The first thing needed would be *teachers*. But here we come up against the inevitable question of motive. The motive must be a vital one and stronger than any prejudice. This is a very serious obstacle. It needs more than mere idealism—the teacher has to be absolutely convinced that his personal attitude is in need of revision, even of actual change. Nobody will condescend to this unless he feels that there really is something wrong. In view of the actual condition of the world every intelligent person is ready to admit that there is something utterly wrong with our attitude. Yet this inclusive statement rarely ever includes the individual in question, namely, the would-be teacher. His attitude is surely right and only needs confirmation and support, but no change. It is a very long step from this conviction to the conclusion: the world is wrong and therefore I am wrong too. To pronounce such words is easy, but to feel their truth in the marrow of one's bones is a very different

proposition, yet it is the *sine qua non* of the true teacher. In other words, it is a question of personalities, without which no method and no organization make sense. *A man whose heart is not changed will not change any other's*. Unfortunately the world of today is inclined to belittle and to ridicule such a simple and evident truth as this and thereby proves its own psychological immaturity, which is one of the prime causes of the present state of affairs as well as of numberless neuroses and individual conflicts.

[1397] Since the Middle Ages our mental horizon has been immensely enlarged, but unfortunately in a one-sided way. The object without prevails over the condition within. We know very little of ourselves, we even hate to know more. Yet it is man that experiences the world and any experience is determined by the subject as well as by the object. Logically the subject should be just as important as the object. But actually we know infinitely less of our psyche than of external objects. This fact cannot fail to impress anybody who tries to understand the motivation of human attitudes. The unconscious of highly educated people is often well-nigh incredible in certain respects, not to mention their prejudices and their irresponsible ways of dealing—or rather not dealing—with them. Naturally they set a suggestive example to the masses with disastrous results, but they are little concerned with the *trahison des clercs*. Our insight and our self-education have not kept pace with the ever-expanding external horizon. On the contrary, we know in some ways less of the psyche than in the Middle Ages.

[1398] It is evident that a better knowledge of man's psyche begins with a better understanding of oneself. If the method is successful it often integrates a vast amount of hitherto unconscious material into consciousness, enlarging both its range of vision and its moral responsibility. When parents know which of their unconscious tendencies and habits are injurious to their children's psyches, they will feel a moral obligation to do something about it, provided their sense of duty and their love are normally developed. The same law will operate in groups and, last but not least, in nations, that is, in the leading minorities, in so far as these consist of individuals who are conscious of certain tendencies which could seriously endanger human relationships. The main danger is *direct and indirect egotism*, i.e., unconsciousness of the ultimate equality of our fellow men. Indirect egotism manifests itself chiefly in an abnormal altruism, which is even capable of forcing something that seems right or good to us upon our neighbour under the disguise of Christian love, humanity and mutual help. Egotism always has the character of *greed*, which shows itself chiefly in three ways: the power-drive, lust, and moral laziness. These three moral evils are supplemented by a fourth which is the most powerful of all—*stupidity*. Real intelligence is very rare and forms statistically an infinitesimal part of the average mind. Viewed from the level of a more highly qualified mind, the average

intelligence is very low. Unfortunately unusual intelligence is often—as an uncommon individual quality—dearly paid for by a corresponding moral weakness or even defect, and is thus a doubtful gift of the gods.

[1399] Greed is uncontrollable except when counteracted by an equally violent morality. Morality, however, if it exceeds the norm, becomes a real danger to human relationship, because it is the direct instigator of compensatory immoral behaviour and thus reveals its secret root, greed.

[1400] A nation consists of the sum of its individuals, and its character corresponds to the moral average. Nobody is immune to a nationwide evil unless he is unshakably convinced of the danger of his own character being tainted by the same evil. But the immunity of the nation depends entirely upon the existence of a leading minority immune to the evil and capable of combatting the powerful suggestive effect of seemingly possible wish-fulfilments. If the leader is not absolutely immune, he will inevitably fall a victim to his own will-to-power.

[1401] The accumulated greed of a nation becomes utterly uncontrollable unless counteracted by all the forces (civil and military) a government is equipped with. No suggestion works unless one is convinced of its power. Arguments are ineffectual.

III

[1402] As to the next step for further development of the aforesaid method we propose:

a. Giving publicity to the ideas mentioned above in circles likely to influence the few who are capable of drawing their own conclusions.

b. If there are some who share the conviction that their own attitude is really in need of revision, they should be given the opportunity to submit to individual treatment.

c. Since a great deal of self-deception is to be expected as to the seriousness of one's motivations, some would soon drop out while others would need more time than was foreseen. In this case the financial allowance granted to the former would go to the latter, so that they could continue their work for as long as from six months to a year.

d. As “a change of attitude” is a rather indefinite term, we must emphasize that we understand by this the change brought about through the integration of formerly unconscious contents into consciousness. Such an addition inevitably involves a change that is felt as such. The change is never neutral. It is essentially an increase of consciousness and it depends entirely upon the individual's character what form it will ultimately take. It is, when it comes to the worst, an inoculation with one's own virtue. It is a challenge to the whole man, and it must be considered a risk—the risk involved in the further development of man's consciousness.²

THE EFFECT OF TECHNOLOGY ON THE HUMAN PSYCHE¹

[1403] The question you ask me, concerning the effect of technology on the human psyche, is not at all easy to answer, as you may well imagine. The problem is a very complicated one.

[1404] Since technology consists of certain procedures invented by man, it is not something that somehow lies outside the human sphere. One may therefore conjecture that certain modes of human adaptation also exist which would meet the requirements of technology. Technological activities mostly consist in the identical repetition of rhythmical procedures. This corresponds to the basic pattern of primitive labour, which is never performed without rhythm and an accompanying chant. The primitive, that is, the man who is relatively instinctive, can put up with an extraordinary amount of monotony. There is even something fascinating about it for him. When the work is accompanied by drumming, he is able to heat himself up into an ecstasy, or else the monotony of the action makes him fall into a semi-unconscious condition, which is not so unpleasant either. The question naturally is: What is the effect of these primitive techniques on modern man, who no longer has the capacity to transport himself into semi-unconscious or ecstatic states for any length of time?

[1405] In general it can be said that for modern man technology is an imbalance that begets dissatisfaction with work or with life. It estranges man from his natural versatility of action and thus allows many of his instincts to lie fallow. The result is an increased resistance to work in general. The remedy would presumably be to move industry out of the towns, a four-hour day, and the rest of the time spent in agricultural work on one's own property—if such a thing could be realized. In Switzerland it might be, given time. Naturally it is different with the slum mentality of huge worker-populations, but that is a problem in itself.

[1406] Considered on its own merits, as a legitimate human activity, technology is neither good nor bad, neither harmful nor harmless. Whether it be used for good or ill depends entirely on man's own attitude, which in turn depends on technology. The technologist has something of the same problem as the factory worker. Since he has to do mainly with mechanical factors, there is a danger of his other mental capacities atrophying. Just as an unbalanced diet is injurious to the body, any psychic imbalances have injurious effects in the long run and need compensating. In my practice I have observed how engineers, in particular, very often developed philosophical interests, and this is an uncommonly sound reaction and mode of compensation. For this reason I have always recommended the institution of

Humanistic Faculties at the Federal Polytechnic, to remind students that at least such things exist, so that they can come back to them if ever they should feel a need for them in later life.

[1407] Technology harbours no more dangers than any other trend in the development of human consciousness. The danger lies not in technology but in the possibilities awaiting discovery. Undoubtedly a new discovery will never be used only for the good, but will certainly be used for ill as well. Man, therefore, always runs the risk of discovering something that will destroy him if evilly used. We have come very close to this with the atom bomb. Faced with such menacing developments, one must ask oneself whether man is sufficiently equipped with reason to be able to resist the temptation to use them for destructive purposes, or whether his constitution will allow him to be swept into catastrophe. This is a question which experience alone can answer.

FOREWORD TO NEUMANN: "DEPTH PSYCHOLOGY AND A NEW ETHIC"¹

[1408] The author has asked me if I would write a foreword to the present book. I am happy to comply with this request, although it is only as an empiricist, and never as a philosopher, that I have been concerned with depth psychology, and cannot boast of ever having tried my hand at formulating ethical principles. My professional work has certainly given me plenty of opportunities to do this, since the chief causes of a neurosis are conflicts of conscience and difficult moral problems that require an answer. The psychotherapist thus finds himself in an extremely awkward situation. Having learnt by long and often painful experience the relative ineffectiveness of trying to inculcate moral precepts, he has to abandon all admonitions and exhortations that begin with "ought" and "must." In addition, with increasing experience and knowledge of psychic relationships, the conviction dwindles away that he knows exactly what is good and bad in every individual case. His *vis-à-vis*, the other person, is indeed "another," a profound stranger, if ever the discussion should penetrate to the core of the problem, namely, the unique individuality of the patient. What is then meant by "good"? Good for him? Good for me? Good for his relatives? Good for society? Our judgment becomes so hopelessly caught in a tangle of subsidiary considerations and relationships that, unless circumstances compel us to cut through the Gordian knot, we would do better to leave it alone, or content ourselves with offering the sufferer what modest help we can in unravelling the threads.

[1409] For these reasons it is particularly difficult for the medical psychologist to formulate any ethical principles. I do not mean that such a task does not exist, or that its solution is absolutely impossible. I fully recognize that there is an urgent need today to formulate the ethical problem anew, for, as the author aptly points out, an entirely new situation has arisen since modern psychology broadened its scope by the study of unconscious processes. Concurrently with this, things have happened in Europe, and still go on happening, that far surpass the horrors of imperial Rome or the French reign of terror; things that have ruthlessly revealed the weakness of our whole system of ethics.

[1410] Moral principles that seem clear and unequivocal from the standpoint of ego-consciousness lose their power of conviction, and hence their applicability, when we consider the *compensatory significance of the shadow* in the light of ethical responsibility. No man endowed with any ethical sense can avoid doing this. Only a man who is repressed or morally stupid will be able to neglect this task, though he

will not be able to get rid of the evil consequences of such behaviour. (In this respect the author utters some heartening truths.)

[1411] The tremendous revolution of values that has been brought about by the discovery of the unconscious, with repercussions still to come, is scarcely understood today or even noticed. The psychological foundation of all philosophical assertions, for example, is still assiduously overlooked or deliberately obscured, so much so that certain modern philosophies unconsciously lay themselves open to psychological attack. The same is true of ethics.

[1412] It is, understandably enough, the medical psychologist who is the first to be impressed by the shortcomings or evils of the epoch, for he is the first to have to deal with its casualties. The treatment of neurosis is not, in the last resort, a technical problem, but a moral one. There are, admittedly, interim solutions that are technical, but they never result in the kind of ethical attitude that could be described as a real cure. Although every act of conscious realization is at least a step forward on the road to individuation, to the “making whole” of the individual, the integration of the personality is unthinkable without the responsible, and that means moral, relation of the parts to one another, just as the constitution of a state is impossible without mutual relations between its members. The ethical problem thus poses itself, and it is primarily the task of the psychologist to provide an answer or to help his patient find one. Often this work is wearisome and difficult, because it cannot be accomplished by intellectual shortcuts or moral recipes, but only by careful observation of the inner and outer conditions. Patience and time are needed for the gradual crystallization of a goal and a direction for which the patient can take responsibility. The analyst learns that ethical problems are always intensely individual and can convince himself again and again that the collective rules of conduct offer at most provisional solutions, but never lead to those crucial decisions which are the turning-points in a man’s life. As the author rightly says: “The diversity and complexity of the situation make it impossible for us to lay down any theoretical rule of ethical behaviour.”

[1413] The formulation of ethical rules is not only difficult but actually impossible because one can hardly think of a single rule that would not have to be reversed under certain conditions. Even the simple proposition “Conscious realization is good” is only of limited validity, since we not infrequently meet with situations in which conscious realization would have the worst possible consequences. I have therefore made it a rule to take the “old ethic” as binding only so long as there is no evidence of its injurious effects. But if dangerous consequences threaten, one is then faced with a problem of the first order,² the solution of which challenges the personality to the limit and demands the maximum of attention, patience and time. The solution, in my experience, is always individual and is only subjectively valid. In such a situation, all those reflections which the author passes under review have to be

considered very seriously. Despite their subjective nature, they cannot very well be formulated except as collective concepts. But since these reflections constantly recur in practice—for the integration of unconscious contents continually poses such questions—it necessarily follows that, in spite of individual variation, they will exhibit certain regular features which make it seem possible to abstract a limited number of rules. I do not, myself, think that any of these rules are absolutely valid, for on occasion the opposite may be equally true. That is what makes the integration of the unconscious so difficult: we have to learn to think in antinomies, constantly bearing in mind that every ultimate truth turns into an antinomy if it is thought out to the end. All our statements about the unconscious are “eschatological” truths, that is, borderline concepts which formulate a partially apprehended fact or situation, and are therefore only conditionally valid.

[1414] The ethical problems that cannot be solved in the light of collective morality or the “old ethic” are *conflicts of duty*, otherwise they would not be ethical. Although I do not share Friedrich Theodor Vischer’s optimistic view that morality is always self-evident, I am nevertheless of the opinion that in working out a difficult problem the moral aspect of it has to be considered if one is to avoid a repression or a deception. He who deceives others deceives himself, and vice versa. Nothing is gained by that, least of all the integration of the shadow. Indeed, its integration makes the highest demands on an individual’s morality, for the “acceptance of evil” means nothing less than that his whole moral existence is put in question. Decisions of the most momentous kind are called for. The alchemical dictum “The art requires the whole man” is particularly true of the integration of the unconscious, and this process was in fact symbolically anticipated by the alchemists. It is evident, therefore, that the solution will be satisfactory only if it expresses the whole of the psyche. This is not possible unless the conscious mind takes account of the unconscious, unless desire is confronted with its possible consequences, and unless action is subjected to moral criticism.

[1415] Nor should it be forgotten that moral law is not just something imposed upon man from outside (for instance, by a crabbed grandfather). On the contrary, it expresses a psychic fact. As the regulator of action, it corresponds to a preformed image, a pattern of behaviour which is archetypical and deeply embedded in human nature. This has no fixed content; it represents the specific form which any number of different contents may take. For one person it is “good” to kill those who think differently from him; for another the supreme law is tolerance; for a third it is a sin to skin an animal with an iron knife; for a fourth it is disrespectful to step on the shadow of a chief. Fundamental to all these rules is “religious observation” or “careful consideration,” and this involves a moral effort which is indispensable for the development of consciousness. A saying of Jesus in the Codex Bezae (referring to

Luke 6: 4) expresses it in lapidary form: “Man, if thou knowest what thou doest, thou art blessed. But if thou knowest not, thou art accursed and a transgressor of the law.”

[1416] We might therefore define the “new ethic” as a development and differentiation within the old ethic, confined at present to those uncommon individuals who, driven by unavoidable conflicts of duty, endeavour to bring the conscious and the unconscious into responsible relationship.

[1417] In so far as ethics represent a system of moral demands, it follows that any innovations within or outside this system would also possess a “deontological” character. But the psychic situation to which the new admonition “you ought” would be applicable is so complicated, delicate and difficult that one wonders who would be in a position to make such a demand. Nor would it be needed at all since the ethically minded person who gets into a situation of this sort has already been confronted with this same demand, from within, and knows only too well that there is no collective morality that could extricate him from his dilemma. If the values of the old ethic were not seated in the very marrow of his bones, he would never have got into this situation in the first place. Let us take as an example the universally valid commandment: Thou shalt not lie. What is one to do if, as frequently happens to a doctor, one finds oneself in a situation where it would be a catastrophe to tell the truth or to suppress it? If one does not want to precipitate the catastrophe directly, one cannot avoid telling a convincing lie, prompted by psychological common sense, readiness to help, Christian charity, consideration for the fate of the other people concerned—in short, by ethical motives just as strong as if not stronger than those which compel one to tell the truth. One comforts oneself with the excuse that it was done in a good cause and was therefore moral. But anyone who has insight will know that on the one hand he was too cowardly to precipitate a catastrophe, and on the other hand that he has lied shamelessly. He has done evil but at the same time good. No one stands beyond good and evil, otherwise he would be out of this world. Life is a continual balancing of opposites, like every other energetic process. The abolition of opposites would be equivalent to death. Nietzsche escaped the collision of opposites by going into the madhouse. The yogi attains the state of *nirvandva* (freedom from opposites) in the rigid lotus position of non-conscious, non-acting *samadhi*. But the ordinary man stands between the opposites and knows that he can never abolish them. There is no good without evil, and no evil without good. The one conditions the other, but it does not become the other or abolish the other. If a man is endowed with an ethical sense and is convinced of the sanctity of ethical values, he is on the surest road to a conflict of duty. And although this looks desperately like a moral catastrophe, it alone makes possible a higher differentiation of ethics and a broadening of consciousness. A conflict of duty forces us to examine our conscience and thereby to discover the shadow. This, in turn, forces us to come to terms with the

unconscious. The ethical aspect of this process of integration is described with praiseworthy clarity by the author.

[1418] Those who are unfamiliar with the psychology of the unconscious will have some difficulty in envisaging the role which the unconscious plays in the analytical process. The unconscious is a living psychic entity which, it seems, is relatively autonomous, behaving as if it were a personality with intentions of its own. At any rate it would be quite wrong to think of the unconscious as mere “material,” or as a passive object to be used or exploited. Equally, its biological function is not just a mechanical one, in the sense that it is merely *complementary* to consciousness. It has far more the character of *compensation*, that is, an intelligent choice of means aiming not only at the restoration of the psychic equilibrium but at an advance towards wholeness. The reaction of the unconscious is far from being merely passive; it takes the initiative in a creative way, and sometimes its purposive activity predominates over its customary reactivity. As a partner in the process of conscious differentiation, it does not act as a mere opponent, for the revelation of its contents enriches consciousness and assists differentiation. A hostile opposition takes place only when consciousness obstinately clings to its one-sidedness and insists on its arbitrary standpoint, as always happens when there is a repression and, in consequence, a partial dissociation of consciousness.

[1419] Such being the behaviour of the unconscious, the process of coming to terms with it, in the ethical sense, acquires a special character. The process does not consist in dealing with a given “material,” but in negotiating with a psychic minority (or majority, as the case may be) that has equal rights. For this reason the author compares the relation to the unconscious with a parliamentary democracy, whereas the old ethic unconsciously imitates, or actually prefers, the procedure of an absolute monarchy or a tyrannical one-party system. Through the new ethic, the ego-consciousness is ousted from its central position in a psyche organized on the lines of a monarchy or totalitarian state, its place being taken by *wholeness* or the *self*, which is now recognized as central. The self was of course always at the centre, and always acted as the hidden director. Gnosticism long ago projected this state of affairs into the heavens, in the form of a metaphysical drama: ego-consciousness appearing as the vain demiurge, who fancies himself the sole creator of the world, and the self as the highest, unknowable God, whose emanation the demiurge is. The union of conscious and unconscious in the individuation process, the real core of the ethical problem, was projected in the form of a drama of redemption and, in some Gnostic systems, consisted in the demiurge’s discovery and recognition of the highest God.

[1420] This parallel may serve to indicate the magnitude of the problem we are concerned with, and to throw into relief the special character of the confrontation with the unconscious on an ethic plane. The problem is indeed a vital one. This may

explain why the question of a new ethic is of such serious and urgent concern to the author, who argues his case with a boldness and passion well matched by his penetrating insight and thoughtfulness. I welcome this book as the first notable attempt to formulate the ethical problems raised by the discovery of the unconscious and to make them a subject for discussion.

March 1949

FOREWORD TO BAYNES : “ANALYTICAL PSYCHOLOGY AND THE ENGLISH MIND”¹

[1421] I write these few introductory words to this collection of essays and lectures in affectionate memory of their author. The late H. G. Baynes was my assistant for several years, my travelling companion on our African expedition, and my faithful friend till his all too early death, which has left a painful gap in the circle of his friends and colleagues.

[1422] His first published work was his most excellent translation of my book *Psychological Types*.² Later he became well known as the author of two important works, *Mythology of the Soul*³ and *Germany Possessed*.⁴ The first of these deals with the daily reality of the psychotherapist, and the second with contemporary events.

[1423] In *Mythology of the Soul* the author uses raw material—such as the psychotherapist meets with daily in his consulting hours—as a clue to guide the reader through the maze of individual reflections, opinions, interpretations, and attempts at explanation which a psychologist gathers in the course of his experience. The empirical material stimulates such considerations, and they are also indispensable in order to integrate it in consciousness.

[1424] *Germany Possessed* is concerned with the great contemporary problems which form a direct challenge to the psychologically minded doctor. This book made the author known to a very wide public.

[1425] His shorter writings, which have been collected in this present volume, deal with the complex psychic conditions characteristic of medical psychology. Psychology is thus a discipline which obliges the medical psychologist to deal with complex psychic factors, for the psychotherapeutic process can only take place on this level. Therefore analytical psychology is also rightly called “complex psychology.”

[1426] A simplifying theory is naturally exceedingly popular in this highly complicated field, but the author has wisely resisted any such temptation. In its place he has drawn from a really remarkable wealth of theoretical and practical points of view and has opened up possibilities and connections worthy of further discussion.

[1427] H. G. Baynes left us too soon. May this volume, which he has left to us, become a milestone on the road of psychological research.

THE RULES OF LIFE¹

[1428] In reply to your kind enquiry about “rules of life,” I would like to remark that I have had so much to do with people that I have always endeavoured to live by no rules as far as possible. Non-observance of rules requires, of course, far less effort, for usually one makes a rule in order to repress the tendency in oneself not to follow it. In psychology, above all, rules are valid only when they can be reversed. Also, they are not without their dangers, since they consist of words and our civilization is largely founded on a superstitious belief in words. One of the supreme religious assumptions is actually the “Word.” Words can take the place of men and things. This has its advantages but it is also a menace. One can then spare oneself the trouble of thinking for oneself or making any effort, to one’s own advantage or disadvantage and that of one’s fellows.

[1429] I have, for instance, a tendency to make a principle of doing what I want to do or should do as soon as possible. This can be very unwise and even stupid. The same applies to practically all adages and “rules of life.” Take, for example, the saying, “Quid-*quid id est, prudenter agas et respice finem*” (Whatever it be, act prudently and consider the end). But in this way, however praiseworthy the principle is, you can let a vitally important decision of the moment slip through your fingers.

[1430] No rules can cope with the paradoxes of life. Moral law, like natural law, represents only one aspect of reality. It does not prevent one from following certain “regular” habits *unconsciously*—habits which one does not notice oneself but can only discover by making-careful inquiries among one’s fellows. But people seldom enjoy having what they don’t know about themselves pointed out to them by others, and so they prefer to lay down rules which are the exact opposite of what they are doing in reality.

ON FLYING SAUCERS¹

[1431] Your wish to bring up the “Flying Saucers” for discussion is certainly a timely one. But though you may not have overshot the mark in questioning me, I must tell you that in spite of the interest I have taken in the subject since about 1946, I have still not been able to establish an empirical basis sufficient to permit any conclusions to be drawn. In the course of years I have accumulated a voluminous dossier on the sightings, including the statements of two eyewitnesses well-known to me personally (I myself have never seen anything!) and have read all the available books, but I have found it impossible to determine even approximately the nature of these observations. So far only one thing is certain: it is not just a rumour, *something is seen*. What is seen may in individual cases be a subjective vision (or hallucination), or, in the case of several observers seeing it simultaneously, a collective one. A psychic phenomenon of this kind would, like a rumour, have a compensatory significance, since it would be a spontaneous answer of the unconscious to the present conscious situation, i.e., to fears created by an apparently insoluble political situation which might at any moment lead to a universal catastrophe. At such times men’s eyes turn to heaven for help, and marvellous signs appear from on high, of a threatening or reassuring nature. (The “round” symbols are particularly suggestive, appearing nowadays in many spontaneous fantasies directly associated with the threatening world situation.)

[1432] The possibility of a purely psychological explanation is illusory, for a large number of observations point to a natural phenomenon, or even a physical one—for instance, those explicable by reflections from “temperature inversions” in the atmosphere. Despite its contradictory statements, the American Air Force, as well as the Canadian, consider the sightings to be “real,” and have set up special bureaux to collect the reports. The “disks,” however, that is, the objects themselves, do not behave in accordance with physical laws but as though they were weightless, and they show signs of *intelligent guidance* such as would suggest quasi-human pilots. Yet the accelerations are so tremendous that no human being could survive them.

[1433] The view that the disks are real is so widespread (in America) that reports of landings were not long in coming. Recently I read accounts of this kind from two different sources. In both of them the mystical element in the vision or fantasy was very much in evidence: they described half-human, idealized human beings like angels who delivered the appropriate edifying messages.² Unfortunately, there is a total lack of any useful information. And in both cases the photographs failed to

come out. Reports of landings, therefore, must for the time being be taken with considerable caution.

[1434] What astonishes me most of all is that the American Air Force, despite all the information it must possess, and despite its alleged fear of creating a panic similar to the one which broke out in New Jersey on the occasion of Welles's radio play,³ is systematically working towards that very thing by refusing to release an authentic and reliable account of the facts.⁴ All we have to go on is the occasional information squeezed out by journalists. It is therefore impossible for the uninitiated to form an adequate picture of what is happening. Although for eight years I have been collecting everything that came within my reach, I must admit I am no further forward today than I was at the beginning. I still do not know what we are up against with these "flying saucers." The reports are so weird that, granted the reality of these phenomena, one feels tempted to compare them with parapsychological happenings.

[1435] Because we lack any sure foundation, all speculation is worthless. We must wait and see what the future brings. So-called "scientific" explanations, such as Menzel's reflection theory, are possible only if all the reports that fail to fit the theory are conveniently overlooked.

[1436] That is all I have to say on the subject of Flying Saucers. An interview would therefore not be worthwhile.

[Supplementary Questions Addressed to Jung by Letter]

Supposing it should turn out that we are being spied upon by non-human, intelligent beings, do you think that this could be assimilated into the existing world-picture without harmful results? Or do you think it would necessarily lead to a kind of Copernican revolution, and that consequently the panic you fear would be a legitimate counteraction?

Further, should the responsible authorities take steps to prevent a panic, and what psychohygienic measures seem suitable to you for this purpose?

[1437] These questions are entirely legitimate today, since there are responsible persons—better informed than I—who are of the opinion that the phenomena we are discussing are of extraterrestrial origin. As I have said, I cannot, or cannot yet, share this view, because I have not been able to obtain the necessary confirmation. If these "objects" are, as claimed, of extraterrestrial or possibly planetary origin (Mars, Venus), we still have to consider the reports of Saucers rising out of the sea or the earth. We must also take account of numerous reports of phenomena resembling ball lightning, or strange, stationary will-o'-the-wisps (not to be confused with St. Elmo's fire). In rare cases ball lightning can attain considerable dimensions, appearing as a dazzling ball of light, half as big as the moon, moving slowly from cloud to cloud, or

ripping a path about five yards wide and 200 yards long through a forest, smashing all the trees in its way. It is either soundless, like the Saucers, or it can vanish with a clap of thunder. It is possible that ball lightning in the form of isolated charges of electricity (so-called “bead-lightning”) is the origin of those Saucers arranged in a row which have been photographed on several occasions. Other electrical phenomena have frequently been reported in connection with the Saucers.

[1438] If, despite this still unclarified possibility, the extraterrestrial origin of the Saucers should be confirmed, this would prove the existence of intelligent interplanetary communication. What such a fact might mean for humanity cannot be imagined. But there is no doubt we would find ourselves in the same critical situation as primitive societies confronted with the superior culture of the white man. The reins of power would be wrenched from our hands, and, as an old witch doctor once told me with tears in his eyes, we would have “no dreams any more”—the lofty flights of our spirit would have been checked and crippled forever.

[1439] Naturally, the first thing to be consigned to the rubbish heap would be our science and technology. What the moral effects of such a catastrophe would be can be seen from the pitiful decay of primitive cultures taking place before our eyes. That the construction of such machines would be evidence of a scientific technology immensely superior to ours admits of no two opinions. Just as the Pax Britannica put an end to tribal warfare in Africa, so our world could roll up its Iron Curtain and use it as so much scrap along with all the billions of tons of armaments, warships, and munitions. That wouldn't be such a bad thing, but we would have been “discovered” and colonized—reason enough for universal panic!

[1440] If we wish to avoid such a catastrophe, the officials in possession of authoritative information should not hesitate to enlighten the public as speedily and thoroughly as possible, and above all stop this stupid game of mystification and suggestive allusion. Instead, they have allowed a lot of fantastic and mendacious publicity to run riot—the best possible preparation for panic and psychic epidemics.

[Further Supplementary Questions]

The idea of a possible parallel with parapsychological processes is extremely interesting. Presumably you are thinking of apparitions?

You write that in times like these men's eyes turn to heaven for help. Are you thinking of some period of upheaval in the past, which produced comparable phenomena? Is there evidence of other collective visions or hallucinations with a similar content?

How do you explain the fact that with few exceptions Saucers have so far been observed only over the North American continent? Does this, in your view, suggest

that they are more likely to be psychic—specifically American “apparitions,” as it were—or, on the contrary, that they are of an objective nature?

[1441] It is hardly possible to answer your question about the analogy of the Saucers with parapsychological phenomena, since a basis for comparison is totally lacking. If we wished to take such a possibility seriously, it would first have to be shown that the “apparitions” are causally connected with psychic states; in other words, that under the influence of certain emotional conditions a major population group experiences the same psychic dissociation and the same exteriorization of psychic energy as does a single medium. All we know at present is that collective visions do exist. But whether collective *physical* phenomena, such as levitations, apparitions of light, materializations, etc., can also be produced is a moot question. At present any reference to the parapsychological aspect only demonstrates the boundless perplexity in which we find ourselves today.

[1442] I cannot refrain from remarking, however, that the whole collective psychological problem that has been opened up by the Saucer epidemic stands in compensatory antithesis to our scientific picture of the world. In the United States this picture has if possible an even greater dominance than with us. It consists, as you know, very largely of statistical or “average” truths. These exclude all rare borderline cases, which scientists fight shy of anyway because they cannot understand them. The consequence is a view of the world composed entirely of normal cases. Like the “normal” man, they are essentially *fictions*, and particularly in psychology fictions can lead to disastrous errors. Since it can be said with a little exaggeration that reality consists mainly of exceptions to the rule, which the intellect then reduces to the norm, instead of a brightly coloured picture of the real world we have a bleak, shallow rationalism that offers stones instead of bread to the emotional and spiritual hungers of the world. The logical result is an insatiable hunger for anything extraordinary. If we add to this the great defeat of human reason, daily demonstrated in the newspapers and rendered even more menacing by the incalculable dangers of the hydrogen bomb, the picture that unfolds before us is one of universal spiritual distress, comparable to the situation at the beginning of our era or to chaos that followed A.D. 1000, or the upheavals at the turn of the fifteenth century. It is therefore not surprising if, as the old chroniclers report, all sorts of signs and wonders appear in the sky, or if miraculous intervention, where human efforts have failed, is expected from heaven. Our Saucer sightings can be found—*mutatis mutandis*—in many reports that go back to antiquity, though not, it would seem, with the same overwhelming frequency. But then, the possibility of destruction on a global scale, which has been given into the hands of our so-called politicians, did not exist in those days.

[1443] McCarthyism and the influence it has exerted are evidence of the deep and anxious apprehensions of the American public. Therefore most of the signs in the skies will be seen in North America.

[1444] At the beginning of this century I was firmly convinced that nothing heavier than air could fly and that the atom was really “a-tomic” (indivisible). Since then I have become very cautious and will only repeat what I said at the beginning of our correspondence: Despite a fairly thorough knowledge of the available literature (six books and countless reports and articles, including two eyewitness reports), I still do not know what kind of reality the Flying Saucers may have. So I am not in a position to draw conclusions and to form any reliable judgment. I just don’t know what one should make of this phenomenon.

*Statement to the United Press International*⁵

[1445] As a result of an article published in the *APRO Bulletin*, the report has been spread by the press that in my opinion the Ufos are physically real. This report is altogether false. In a recently published book (*Ein Moderner Mythos*, Zurich, 1958),⁶ I expressly state that I cannot commit myself on the question to the physical reality or unreality of the Ufos since I do not possess sufficient evidence either for or against. I therefore concern myself solely with the psychological aspect of the phenomenon, about which a great deal of material is available. I have formulated the position I take on the question of the reality of Ufos in the following sentence: “Something is seen, but it isn’t known what.” This formulation leaves the question of “seeing” open. Something material could be seen, or something psychic could be seen. Both are realities, but of different kinds.

[1446] My relations with APRO are confined to the following: while I was collecting material for the above-mentioned book, the *APRO Bulletin* approached me in a friendly manner. When this organization recently asked me if they might consider me to be an honorary member, I consented. I have sent my book to APRO to inform them of my position in regard to the Ufo question. APRO advocates the physical reality of the Ufo with much zeal and idealism. I therefore regard its misleading article as a regrettable accident.

*Letter to Keyhoe*⁷

16 August 1958

Major Donald E. Keyhoe
National Investigation Committee on Aerial Phenomena
1536 Connecticut Avenue

Washington 6, D. C.

Dear Major Keyhoe,

[1447] Thank you very much for your kind letter! I have read all you have written concerning Ufos and I am a subscriber to the *NICAP Bulletin*. I am grateful for all the courageous things you have done in elucidating the thorny problem of Ufo-reality.

[1448] The article in *APRO Bulletin* July 1958, which caused all that stir in the press, is unfortunately inaccurate. As you know I am an alienist and medical psychologist. I have never seen a Ufo and I have no first-hand information either about them or about the dubious attitude of the AAF [American Air Force]. On account of this regrettable lack I am unable to form a definite opinion concerning the physical nature of the Ufo-phenomenon. As I am a scientist, I only say what I can prove and reserve my judgment in any case where I doubt my competence. Thus I said: "Things are seen, but one does not know what." I neither affirm, nor deny. But it is certain beyond all possible doubt that plenty of statements about Ufos are made and they are of all sorts. I am chiefly concerned with this aspect of the phenomenon. It yields a rich harvest of insight into its universal significance. My special preoccupation precludes neither the physical reality of the Ufos nor their extraterrestrial origin, nor the purposefulness of their behaviour, etc. But I do not possess sufficient evidence which would enable me to draw definite conclusions. The evidence available to me however is convincing enough to arouse a continuous and fervent interest. I follow with my greatest sympathy your exploits and your endeavours to establish the truth about the Ufos.

[1449] In spite of the fact that I hold my judgment concerning the nature of the Ufos—temporarily let us hope—in abeyance, I thought it worth while to throw a light upon the rich fantasy material which has accumulated round the peculiar observations in the skies. Any new experience has two aspects: (1) the pure fact and (2) the way one conceives of it. It is the latter I am concerned with. If it is true that the AAF or the Government withholds telltale facts, then one can only say that this is the most unpsychological and stupid policy one could invent. Nothing helps rumours and panics more than ignorance. It is self-evident that the public ought to be told the truth, because ultimately it will nevertheless come to the light of day. There can be hardly any greater shock than the H-bomb and yet everyone knows of it without fainting.

[1450] As to your question about the possible hostility of the Ufos, I must emphasize that I have no other knowledge about them than that which everybody can get out of printed reports. That is the reason why I am still far from certain about the Ufos' physical reality.

[1451] Thank you for your kind offer to send me clippings. I have got enough of them.
It is a curious fact that whenever I make a statement it is at once twisted and falsified.
The press seems to enjoy lies more than the truth.

I remain, dear Major,

Yours, C. G. JUNG

HUMAN NATURE DOES NOT YIELD EASILY TO IDEALISTIC ADVICE¹

[1452] There is little to criticize in Mr. Roberts' article since its author is obviously a man of good will and optimistic enthusiasm. Moreover, he points in the right direction, and he gives proper value to man's mental and moral attitude. He hopes and believes, it seems to me, that saying the right and good thing will be enough to produce the desired effect. Unfortunately, human nature is a bit more complicated and does not yield to a well-meaning hint or to idealistic advice.

[1453] It always has been and still is the great question how to get the ordinary human to the point where he can make up his mind to draw the right conclusion and to do the right thing, or how to make him listen at all. His moral and mental inertia and his notorious prejudices are the most serious obstacle to any moral or spiritual renaissance. If he had been inclined to resist the overwhelming impact of his emotional entanglements, passions, and desires, and to put a stop to the haste and rush of his daily activities, and to try at least to get out of his lamentable yet cherished unconsciousness about himself, the world and its sad history of intrigue, violence, and cruelty would have reached a state of peace and humanity long before Christ—in the time of Buddha or Socrates. But to get him there, that's just the trouble.

[1454] It is perhaps a good idea to liberate man from all inhibitions and prejudices that hamper, torment, and disfigure him. But the question is less to liberate from something, than rather, as Nietzsche asked, to which end? In certain cases it looks as if in getting rid of one's inhibitions and burdens, one had "thrown away one's best." Liberation can be a good or a very bad solution. It largely depends upon the choice of one's further goal whether the liberation has been a boon or a fatal mistake.

[1455] I don't want to go further into the complexities of this problem, and moreover it would be unfair to criticize the author for something he obviously is not aware of, viz., the fact that this formulation of the problem dates from about forty years ago. Since that time, a voluminous literature thoroughly dealing with the point in question has come into existence. I don't know which circumstances have prevented the author from informing himself about the more modern developments in the discussion between religion and psychology. In view of Freud's notorious inability to understand religion, the reader would have welcomed, if not expected, a summary at least of the main work done along this line during the past four decades. Goodwill and enthusiasm are not to be underrated, but ignorance is regrettable.

ON THE HUNGARIAN UPRISING¹

I

[1456] 1. The bloody suppression of the Hungarian people by the Russian army is a vile and abominable crime, to be condemned forthwith.

2. The Egyptian dictator has by unlawful measures provoked Great Britain and France to a warlike act. This is to be deplored as a relapse into obsolete and barbarous methods of politics.

II

[1457] The crushing of Hungary is one more link in the chain of iniquitous events which make the middle of the twentieth century one of the blackest chapters in history, rich in infamies as it is. Western Europe had to endure the spectacle of a civilized European country being throttled and, conscious of its own miserable impotence, be content to play the Good Samaritan. Though the great storm of indignation unleashed by outraged public feeling was unable to blow away the Russian tanks, it at least brought with it the relief everyone feels when guilt can be laid beyond all doubt at somebody else's door. In the worldwide moral outcry we scarcely heard the voice of our own conscience, reminding the West of those wicked deeds of Machiavellianism, short-sightedness, and stupidity without which the events in Hungary would not have been possible. The focus of the deadly disease lies in Europe.

ON PSYCHODIAGNOSTICS¹

Can one, with today's psychodiagnostic methods, determine the suitability of a candidate for a job, in a matter of hours or days, more efficiently than the employer could with the help of his general knowledge of human nature?

[1458] The employer may have a very good knowledge of human nature, able to size up the total situation intuitively in a few seconds. Naturally you can't acquire a knack like this from any method. There are, however, employers who are anything but good judges of men. In this case a careful and conscientious psychodiagnosis is the only right thing. Anyway, it is better than nothing, and certainly better than the employer's illusions and projections.

Are we right to oppose the use of psychodiagnostics in the selection of candidates, or is it simply another futile attempt to turn back the wheel of history?

[1459] It would be plain stupid to oppose the use of psychodiagnostics, for these tests are so widely used today that nobody can fight against them. By refusing them one puts oneself in a false position from the start, as in certain cases of refusal to testify in court. But if you are faced with a good judge of men, he will extract your painful secrets from your trouser pocket with the greatest skill without your knowing it, and do it much better than was ever done by a psychodiagnostic method.

We would like to ask you for a short prognosis concerning the further development of these methods and their influence on society.

[1460] I am no prophet, and I cannot predict the future of our society. I can only tell you that I hope for a further improvement in psychodiagnostic methods and in the understanding of man in general, as contrasted with the other possibility that any man may be pushed into any kind of job anywhere. Anything that promotes the understanding of one's fellow men is welcome to me.

IF CHRIST WALKED THE EARTH TODAY¹

[1461] It is absolutely certain that if a Christ should reappear in the world he would be interviewed and photographed by the press and would not live longer than one month. He would die being fed up with himself, as he would see himself banalized beyond all endurance. He would be killed by his own success, morally and physically.

FOREWORD TO "HUGH CRICHTON-MILLER, 1877-1959"¹

[1462] It is more than thirty years ago—on the occasion of a short stay in England—that I became acquainted with Dr. Hugh Crichton-Miller. Being a stranger and, on account of my unorthodox views, a psychiatric outsider, I was deeply impressed by the friendly, open, and unprejudiced manner of his welcome. Not only did he introduce me to the staff of his clinic, he also invited me to give them a short address—much to my embarrassment, since I never felt particularly certain of myself when called upon to talk to an entirely unknown audience. But I soon felt the presence of an atmosphere of mutual trust and confidence between chief and staff, so that I could talk to them in a more or less natural way—at least I hope so. Talking to Crichton-Miller was easy. I felt we were speaking the same language, though our views were not always the same. But they were reasonably different, so that a satisfactory discussion was possible. Whenever I had a chance in the course of many years, I very much enjoyed discussing controversial points with him. He was for I don't know how many years the only man of my age with whom I could talk as man to man, without constantly fearing that my partner would suddenly throw a fit or become otherwise impolite. We took each other at our face value and in the course of years we grew slowly into the conviction that we had a good relationship. Such a silent conviction can be, in spite of everything, an illusion as long as it has not come to an actual showdown. The proof of this came in the last years before the second World War.

[1463] We then had an international Society for Psychotherapy on the continent consisting of a Dutch, Danish, Swiss, and a very large German group. The president of the Society had been Professor Kretschmer up to 1933, when he resigned in the fatal year of Hitler's usurpation of power. I had been up to then in the inactive role of an honorary vice-president. The German group, afraid of getting amalgamated with, i.e., overshadowed by, the far more influential "Society for Psychiatry" with its well-known anti-psychological prejudice, asked me to take over the function of president, just because I was non-German and would therefore emphasize the international character of the organization. They hoped in that way to escape complete annihilation, even if they had to survive in a society of herb addicts and believers in "natural healing." I knew it would be a very difficult task if I were to accept this proposition. But having been vice-president for a number of years, I did not consider it particularly honourable conduct to get cold feet, and so I stepped in.

[1464] The first task confronting me was to increase the non-German membership in order to form an adequate counterweight. We added a Swedish group, and I opened

negotiations with French representatives, but I looked most toward England and America. The first person I approached was Crichton-Miller, and I did not find him wanting. He understood the situation and my motives. The Germans became more and more difficult and tried to overwhelm us with a large Italian and even a Japanese membership. Since nothing was known of modern medical psychology in either of those countries, the long lists of new members were composed by order and consisted of people who were absolutely innocent of the slightest professional knowledge of modern psychotherapy. Shortly before the outbreak of the war, it came to a decisive showdown with the Germans in Zurich. Being the British representative, Crichton-Miller lent me personally his invaluable help to ward off the German intrigue. I am forever grateful to him for his sturdy co-operation and his truly loyal friendship. That was the man I shall never forget.

[1465] During the war we naturally saw nothing of each other, and it was only afterwards that I received the shocking news of his fatal disease. I wanted very much to see him again but was overburdened with urgent work and hampered by the consequences of an injury to my heart. I found no occasion to go to England. Fortunately enough, in 1949 he could manage to come out to Switzerland, to the Bernese Oberland, where I went to meet him and his wife. I found him in an advanced stage of his illness. As he had expressed the urgent wish to talk to me, I was eager to hear from him what it was. After lunch we withdrew. He took out a sheet of paper with a closely written text. As our talks hitherto had never been intimate or personal, I was surprised when he plunged straight *in medias res* and asked me to answer a number of questions on religion. It was a complete survey of the *religio medici*, of all the religious conclusions an old doctor might draw from his innumerable experiences of suffering and death and from the inexorable reality of life's reverses. I knew we were talking *in conspectu mortis* of ultimate things, at the end of days. Then we took leave of each other, shook hands amiably and politely, as if after a delightful lunch with a distant yet friendly acquaintance. *Vale amice!*

January 1960

XII

PSYCHOLOGY AND RELIGION

(related to Volume II of the Collected Works)

WHY I AM NOT A CATHOLIC¹

[1466] *Firstly:* Because I am a practical Christian to whom love and justice to his brother mean more than dogmatic speculations about whose ultimate truth or untruth no human being can ever have certain knowledge. The relation to my brother and the unity of the true “catholic” Christendom is to me infinitely more important than “justification by *fide sola*.” As a Christian I have to share the burden of my brother’s wrongness, and that is most heavy when I do not know whether in the end he is not more right than I. I hold it to be immoral, in any case entirely unchristian, to put my brother in the wrong (i.e., to call him fool, ass, spiteful, obdurate, etc.) simply because I suppose myself to be in possession of the absolute truth. Every totalitarian claim gradually isolates itself because it excludes so many people as “defectors, lost, fallen, apostate, heretic,” and so forth. The totalitarian maneuvers himself into a corner, no matter how large his original following. I hold all confessionalism to be completely unchristian.

[1467] *Secondly:* Because I am a doctor. If I possessed the absolute truth I could do nothing further than to press into my patient’s hand a book of devotion or confessional guidance, just what is no longer of any help to him. When, on the other hand, I discover in his untruth a truth, in his confusion an order, in his lostness something that has been found, then I have helped him. This requires an incomparably greater self-abnegation and self-surrender for my brother’s sake than if I assessed, correctly from the standpoint of one confession, the motivations of another.

[1468] You underestimate the immense number of those of goodwill, but to whom confessionalism blocks the doors. A Christian has to concern himself, especially if he is a physician of souls, with the spirituality of the reputedly unspiritual (spirit = confessionalism!) and he can do this only if he speaks their language and certainly not if, in the deterrent way of confessionalism, he sounds the kerygmatic trumpet, hoarse with age. Whoever talks in today’s world of an absolute and single truth is speaking in an obsolete dialect and not in any way in the language of mankind. Christianity possesses a *εὐαγγέλιον*, good tidings from God, but no textbook of a dogma with claim to totality. Therefore it is hard to understand why God should never have sent more than one message. Christian modesty in any case strictly forbids assuming that God did not send *εὐαγγέλια* in other languages, not just in Greek, to other nations. If we think otherwise our thinking is in the deepest sense unchristian. The Christian—my idea of Christian—knows no curse formulas; indeed

he does not even sanction the curse put on the innocent fig-tree by the rabbi Jesus, nor does he lend his ear to the missionary Paul of Tarsus when he forbids cursing to the Christian and then he himself curses the next moment.

[1469] *Thirdly:* Because I am a man of science.

[1470] The Catholic doctrine, as you present it to me so splendidly, is familiar to me to that extent. I am convinced of its “truth” in so far as it formulates determinable psychological facts, and thus far I accept this truth without further ado. But where I lack such empirical psychological foundations it does not help me in the least to believe in anything beyond them, for that would not compensate for my missing knowledge; nor could I ever surrender to the self-delusion of knowing something where I merely believe. I am now nearly seventy years old, but the charisma of belief has never arisen in me. Perhaps I am too overweening, too conceited; perhaps you are right in thinking that the cosmos circles around the God Jung. But in any case I have never succeeded in thinking that what I believe, feel, think, and understand is the only and final truth and that I enjoy the unspeakable privilege of God-likeness by being the possessor of the sole truth. You see that, although I can estimate the charisma of faith and its blessedness, the acceptance of “faith” is impossible for me because it says nothing to me.

[1471] You will naturally remonstrate that, after all, I talk about “God.” I do this with the same right as humanity has from the beginning equated the numinous effects of certain psychological facts with an unknown primal cause called God. This cause is beyond my understanding, and therefore I can say nothing further about it except that I am convinced of the existence of such a cause, and indeed with the same logic by which one may conclude from the disturbance of a planet’s course the existence of a yet unknown heavenly body. To be sure, I do not believe in the absolute validity of the law of causality, which is why I guard against “positing” God as cause, for by this I would have given him a precise definition.

[1472] Such restraint is surely an offense to confessors of the Faith. But according to the fundamental Christian commandment I must not only bear with and understand my schismatic Protestant brother, but also my brothers in Arabia and India. They, too, have received strange but no less notable tidings which it is my obligation to understand. As a European, I am burdened most heavily by my unexpectedly dark brother, who confronts me with his antichristian Neo-Paganism. This extends far beyond the borders of Germany as the most pernicious schism that has ever beset Christianity. And though I deny it a thousand times, *it is also in me*. One cannot come to terms with this conflict by imputing wrong to someone else and the undoubted right to oneself. This conflict I can solve first of all only within myself and not in another.

THE DEFINITION OF DEMONISM¹

[1473] Demonism (synonymous with daemonomania = possession) denotes a peculiar state of mind characterized by the fact that certain psychic contents, the so-called complexes, take over the control of the total personality in place of the ego, at least temporarily, to such a degree that the free will of the ego is suspended. In certain of these states ego-consciousness is present, in others it is eclipsed. Demonism is a primordial psychic phenomenon and frequently occurs under primitive conditions. (Good descriptions in the New Testament, Luke 4:34, Mark 1:23, 5:2, etc.) The phenomenon of demonism is not always spontaneous, but can also be deliberately induced as a “trance,” for instance in shamanism, spiritualism, etc. (Cf. J. Hastings, *Encyclopaedia of Religion and Ethics*; Schürer. “Zur Vorstellung von der Besessenheit im Neuen Testament,” *Jahrbuch für protestantische Theologie*, 1892.)

[1474] Medically, demonism belongs partly to the sphere of the psychogenic neuroses, partly to that of schizophrenia. Demonism can also be epidemic. One of the most celebrated epidemics of the Middle Ages was the possession of the Ursulines of London, 1632. The epidemic form includes the induced collective psychoses of a religious or political nature, such as those of the twentieth century. (Cf. G. le Bon, *The Crowd, a Study of the Popular Mind*, 1896; Otto Stoll, *Suggestion und Hypnotismus in der Völkerpsychologie*, 2nd edn., 1904.)

FOREWORD TO JUNG: "SYMBOLIK DES GEISTES" (1948)

[1475] The present volume, the sixth of the *Psychologische Abhandlungen*, contains five essays which are concerned with the symbolism of the spirit: a study of Satan in the Old Testament by Dr. Riwkah Schärf,¹ and four essays from my pen. The first essay in the book, "The Phenomenology of the Spirit in Fairytales,"² gives an account of the "spirit archetype," or rather, of a dream and fairytale motif whose behaviour is such that one has to conceive of it as "spirit." Examples are also given of the dramatic entanglements to which the appearance of this motif leads. The second essay describes how, in the medieval natural philosophy of the alchemists, the primitive "nature-spirit" developed into the "Spirit Mercurius."³ As the original texts show, a spirit-figure came into being that was directly opposed to the Christian view of the spirit. The third contribution, by Dr. Schärf, describes the historical development of the ungodly spirit, Satan, as depicted in the texts of the Old Testament. The fourth essay, "A Psychological Approach to the Dogma of the Trinity,"⁴ gives a brief sketch of the historical development of the trinitarian concept before and after Christ, followed by a synopsis of psychological viewpoints that need to be taken into account for a rational comprehension of the idea of the Trinity. It goes without saying that in any such discussion, metaphysical views cannot be considered, because, within the confines of a scientific psychology and its tasks, an idea characterized as "metaphysical" can claim the significance only of a psychic phenomenon. Equally the psychologist does not presume to say anything "metaphysical," i.e., transcending his proper province, about his subject-matter—that lies outside his competence. In so far—and only so far—as the Trinity is not merely an object of belief but, over and above that, a human concept falling within the purview of psychology, can it be subjected to scientific observation. This does not affect the object of belief in any way. The reader will do well to keep this limitation of the theme constantly in mind.

[1476] The final contribution⁵ is a description and analysis of a Chinese, but originally Indian, text which describes a way of meditation for the attainment of Buddhahood. I have added this essay for the purpose of rounding out the picture for my reader, showing him an Eastern aspect of it.

[1477] It now remains for me to correct an error. In my book *The Psychology of the Transference*⁶ I promised to publish my new work, *Mysterium Coniunctionis*,⁷ as volume 6 of the "Psychologische Abhandlungen." Owing to illness and other causes I

had to alter plans and am therefore publishing *Symbolik des Geistes* in its stead. The above-mentioned work will not go to press until later.

June 1947

FOREWORD TO QUIPEL: "TRAGIC CHRISTIANITY"¹

[1478] The author of this essay has asked me to start off his book with a few introductory words. Although I am not a philologist, I gladly accede to this request because Dr. Quispel has devoted particular attention to a field of work which is familiar also to me from the psychological standpoint. Gnosticism is still an obscure affair and in need of explanation, despite the fact that sundry personages have already approached it from the most diverse angles and tried their hands at explanations with doubtful success. One even has the impression that the ban on heresy still hangs over this wide domain, or at least the disparagement which specialists are accustomed to feel for annoying incomprehensibilities. We have an equivalent of this situation in psychiatry, which has ostentatiously neglected the psychology of the psychoses and shows pronounced resistances to all attempts in this direction. This fact, though astonishing in itself, is, however, comprehensible when one considers the difficulties to be overcome once one tries to fathom the psychology of delusional ideas. We can understand mental illness only if we have some understanding of the mind in general. Delusional ideas cannot be explained in terms of themselves, but only in terms of our knowledge of the normal mind. Here the only phenomenological method that promises success, as opposed to philosophical and religious prejudice, has made next to no headway, indeed it has still not even been understood. The fundamental reason for this is that the doctor, to whom alone psychopathological experiences are accessible, seldom or never has the necessary epistemological premises at his command. Instead of which, if he reflects at all and does not merely observe and register, he has usually succumbed to a philosophical or religious conviction and fills out the gaps in his knowledge with professions of faith.

[1479] What is true of psychopathology can—*mutatis mutandis*—be applied directly to the treatment which Gnosticism has undergone. Its peculiar mental products demand the same psychological understanding as do psychotic delusional formations. But the philologist or theologian who concerns himself with Gnosticism generally possesses not a shred of psychiatric knowledge, which must always be called upon in explaining extraordinary mental phenomena. The explanation of Gnostic ideas “in terms of themselves,” i.e., in terms of their historical foundations, is futile, for in that way they are reduced only to their less developed forestages but not understood in their actual significance.

[1480] We find a similar state of affairs in the psychopathology of the neuroses, where, for instance, Freud's psychoanalysis reduces the neurotic symptomatology only to its

infantile forestages and completely overlooks its functional, that is, its *symbolic* value. So long as we know only the causality or the historical development of a normal biological or psychic phenomenon, but not its functional development, i.e., its purposive significance, it is not really understood. The same is true of Gnostic ideas: they are not mere symptoms of a certain historical development, but creative new configurations which were of the utmost significance for the further development of Western consciousness. One has only to think of the Jewish-Gnostic presuppositions in Paul's writings and of the immense influence of the "gnostic" gospel of John. Apart also from these important witnesses, and in spite of being persecuted, branded as heresy, and pronounced dead within the realm of the Church, Gnosticism did not die out at once by any means. Its philosophical and psychological aspects went on developing in alchemy up to the time of Goethe, and the Jewish syncretism of the age of Philo² found its continuation within orthodox Judaism in the Kabbala. Both these trends, if not exactly forestages of the modern psychology of the unconscious, are at all events well-nigh inexhaustible sources of knowledge for the psychologist. This is no accident inasmuch as parallel phenomena to the empirically established contents of the collective unconscious underlie the earliest Gnostic systems. The archetypal motifs of the unconscious are the psychic source of Gnostic ideas, of delusional ideas (especially of the paranoid schizophrenic forms), of symbol-formation in dreams, and of active imagination in the course of an analytical treatment of neurosis.

[1481] In the light of these reflections, I regret Dr. Quispel's quotations from the Gnostics, that the "Autopator contained in himself all things, in [a state of] unconsciousness (*ἐν ἀγνώσῃα*)"³ and that "The Father was devoid of consciousness (*ἀνευνόητος*),"⁴ as a fundamental discovery for the psychology of Gnosticism. It means nothing less than that the Gnostics in question derived the knowable *ὑπερκόσμος* from the unconscious, i.e., that these represented unconscious contents. This discovery results not only in the possibility but also in the necessity of supplementing the historical method of explanation by one that is based on a scientific psychology.

[1482] Psychology is indebted to the author for his endeavours to facilitate the understanding of Gnosticism, not merely because we psychologists have made it our task to explain Gnosticism, but because we see in it a *tertium comparationis* which affords us the most valuable help in the practical understanding of modern individual symbol-formation.

May 1949

FOREWORD TO ABEGG: "OSTASIEN DENKT ANDERS"¹

[1483] The author of this book, the entire text of which unfortunately I have not seen, has talked to me about her project and about her ideas with regard to the difference between Eastern and Western psychology. Thus I was able to note many points of agreement between us, and also a competence on her part to make judgments which is possible only to one who is a European and at the same time possesses the invaluable advantage of having spent more than half a lifetime in the Far East, in close contact with the mind of Asia. Without such first-hand experience it would be a hopeless task to approach the problem of Eastern psychology. One must be deeply and directly moved by the strangeness, one might almost say by the incomprehensibility, of the Eastern psyche. Decisive experiences of this kind cannot be transmitted through books; they come only from living in immediate, daily relationship with the people. Having had unusual advantages in this respect, the author is in a position to discuss what is perhaps the basic, and is in any case an extremely important, question of the difference between Eastern and Western psychology. I have often found myself in situations where I had to take account of this difference, as in the study of Chinese and East Indian literary texts and in the psychological treatment of Asiatics. Among my patients, I am sorry to say, I have never had a Chinese or a Japanese, nor have I had the privilege of visiting either China or Japan. But at least I have had the opportunity to experience with painful clarity the insufficiency of my knowledge. In this field we still have everything to learn, and whatever we learn will be to our immense advantage. Knowledge of Eastern psychology provides the indispensable basis for a critique of Western psychology, as indeed for any objective understanding of it. And in view of the truly lamentable psychic situation of the West, the importance of a deeper understanding of our Occidental prejudices can hardly be overestimated.

[1484] Long experience with the products of the unconscious has taught me that there is a very remarkable parallelism between the specific character of the Western unconscious psyche and the "manifest" psyche of the East. Since our experience shows that the biological role which the unconscious plays in the psychic economy is compensatory to consciousness, one can venture the hypothesis that the mind of the Far East is related to our Western consciousness as the unconscious is, that is, as the left hand to the right.

[1485] Our unconscious has, fundamentally, a tendency toward wholeness, as I believe I have been able to prove. One would be quite justified in saying the same thing

about the Eastern psyche, but with this difference: that in the East it is consciousness that is characterized by an apperception of totality, while the West has developed a differentiated and therefore necessarily one-sided attention or awareness. With it goes the Western concept of causality, a principle of cognition irreconcilably opposed to the principle of synchronicity which forms the basis and the source of Eastern “incomprehensibility,” and explains as well the “strangeness” of the unconscious with which we in the West are confronted. The understanding of synchronicity is the key which unlocks the door to the Eastern apperception of totality that we find so mysterious. The author seems to have devoted particular attention to just this point. I do not hesitate to say that I look forward to the publication of her book with the greatest interest.

March 1949

FOREWORD TO ALLENBY: "A PSYCHOLOGICAL STUDY OF THE ORIGINS OF MONOTHEISM"¹

[1486] It can no longer be doubted today that meaningful connections are discoverable in dreams and other spontaneous manifestations of the unconscious. This raises the question of the origin of unconscious contents. Are they genuine creations of the unconscious psyche, or thoughts that were originally conscious but subsequently became unconscious for one reason or another?

[1487] The individual dream-thoughts, or at least their elements, are always of conscious origin, otherwise they could not be represented or recognized. Also, a whole sequence of images connected together in a meaningful way, or an entire scene, frequently derives from the conscious memory. But when we consider the meaning of the dream as a whole, the question of derivation becomes much more difficult to answer. So far as can be established empirically, the function of dreams is to compensate the conscious situation, as though there were a natural drive to restore the balance. The more one-sided the conscious situation is, the more the compensation takes on a *complementary* character. Obvious examples of this can be found in people who naïvely deceive themselves or who hold to some fanatical belief. As we know, the most lurid scenes of temptation are depicted in the dreams of ascetics. In such cases it would be very difficult to prove that the meaning of the dream derives from a conscious thought that subsequently became unconscious, for obviously no such reflection or self-criticism ever took place and for that very reason had to be performed by the dream. The hypothesis becomes completely untenable when the dreams produce meaningful connections which are absolutely unknown to the dreamer or which *cannot* be known to him. The clearest phenomena of this kind, convincing even to the layman, are telepathic dreams which give information concerning events at a distance or in the future, beyond the range of sense-perception.

[1488] These phenomena offer striking proof that there are meaningful connections in the unconscious which are not derived from conscious reflection. The same is true of dream motifs found otherwise only in myths and fairytales, and exhibiting characteristic forms of which the dreamer has no conscious knowledge. Here we are not dealing in any sense with ideas, but with instinctual factors, the fundamental forms that underlie all imaginative representation; in short, with a pattern of mental behaviour which is ingrained in human nature. This accounts for the universal occurrence of these archetypes of the imagination. Their *a priori* presence is due to

the fact that they, like the instincts, are inherited, and therefore constantly produce mythological motifs in every individual as soon as his imagination is given free play, or whenever the unconscious gains the upper hand.

[1489] Modern psychological experience has shown that not only the meaning of the dream, but also certain dream-contents, must derive entirely from the unconscious, for the simple reason that they could not have been known to consciousness and therefore cannot be derived from it.

[1490] However slight the effect of a particular dream may be, the unconscious compensation is of great importance for a man's conscious life and for what one calls his "fate." The archetypes naturally play a considerable role here, and it is no accident that these determining factors have always been personified in the form of gods and demons.

[1491] Since the relation of the unconscious to consciousness is not a mechanical one and not purely complementary, but performs a meaningful and compensatory function, the question arises as to who might be the "author" of the effects produced. In our ordinary experience, phenomena of this kind occur only in the realm of the thinking and willing ego-consciousness. There are, however, very similar "intelligent" acts of compensation in nature, especially in the instinctual activities of animals. For us, at least, they do not have the character of conscious decisions, but appear to be just like human activities that are exclusively controlled by the unconscious. The great difference between them is that the instinctual behaviour of animals is predictable and repetitive, whereas the compensatory acts of the unconscious are individual and creative.

[1492] The "author" in both cases seems to be the pattern of behaviour, the archetype. Although in human beings the archetype represents a collective and almost universal mode of action and reaction, its activity cannot as a rule be predicted; one never knows when an archetype will react, and which archetype it will be. But once it is constellated, it produces "numinous" effects of a determining character. Thus Freud not only stumbled on the Oedipus complex but also discovered the dual-mother motif of the hero myth in Leonardo da Vinci. But he made the mistake of deriving this motif from the fact that Leonardo had two mothers in reality, namely, his real mother and a stepmother. Actually, the dual-mother motif occurs not only in myths but also in the dreams and fantasies of individuals who neither have two mothers nor know anything about the archetypal motifs in mythology. So there is no need of two mothers in reality to evoke the dual-mother motif. On the contrary, the motif shows the tendency of the unconscious to reproduce the dual-mother situation, or the story of double descent or child-substitution, usually for the purpose of compensating the subject's feelings of inferiority.

[1493] As the archetypes are instinctive, inborn forms of psychic behaviour, they exert a powerful influence on the psychic processes. Unless the conscious mind intervenes critically and with an effort of will, things go on happening as they have always happened, whether to the advantage or disadvantage of the individual. The advantages seem to preponderate, for otherwise the development of consciousness could hardly have come about. The advantage of “free” will is indeed so obvious that civilized man is easily persuaded to leave his whole life to the guidance of consciousness, and to fight against the unconscious as something hostile, or else dismiss it as a negligible factor. Because of this, he is in danger of losing all contact with the world of instinct—a danger that is still further increased by his living an urban existence in what seems to be a purely manmade environment.

[1494] This loss of instinct is largely responsible for the pathological condition of our contemporary culture. The great psychotherapeutic systems embodied in religion still struggle to keep the way open to the archetypal world of the psyche, but religion is increasingly losing its grip with the result that much of Europe today has become dechristianized or actually anti-Christian. Seen in this light, the efforts of modern psychology to investigate the unconscious seem like salutary reactions of the European psyche, as if it were seeking to re-establish the connection with its lost roots. It is not simply a matter of rescuing the natural instincts (this seems to have been Freud’s particular preoccupation), but of making contact again with the archetypal functions that set bounds to the instincts and give them form and meaning. For this purpose a knowledge of the archetypes is indispensable.

[1495] The question of the existence of an archetypal *God-image* is naturally of prime importance as a factor determining human behaviour. From the history of symbols as well as from the case histories of patients it can be demonstrated empirically that such a God-image actually exists, an image of wholeness which I have called the symbol of the *self*. It occurs most frequently in the form of *mandala* symbols. The author of this book has made it her task to investigate the psychological aspect of the God-image on the one hand and the theological aspect of the self on the other—a task which in my view is as necessary as it is timely. At a time when our most valuable spiritual possessions are being squandered, we would do well to consider very carefully the meaning and purpose of the things we so heedlessly seek to cast overboard. And before raising the cry that modern psychology destroys religious ideas by “psychologizing” them, we should reflect that it is just this psychology which is trying to renew the connection with the realities of the psyche, lest consciousness should flutter about rootlessly and helplessly in the void, a prey to every imaginable intellectualism. Atrophy of instinct is equivalent to pathological suggestibility, the devastating effects of which may be witnessed in the recurrent psychic epidemics of totalitarian madness.

[1496] I can only hope this book finds a wide circle of serious readers.

May 1950

THE MIRACULOUS FAST OF BROTHER KLAUS¹

[1497] The fact that Brother Klaus, on his own admission and according to the reports of reliable witnesses, lived without material sustenance for twenty years is something that cannot be brushed aside however uncomfortable it may be. In the case of Therese of Konnersreuth² there are also reports, whose reliability of course I can neither confirm nor contest, that for a long period of time she lived simply and solely on holy wafers. Such things naturally cannot be understood with our present knowledge of physiology. One would be well advised, however, not to dismiss them as utterly impossible on that account. There are very many things that earlier were held to be impossible which nevertheless we know and can prove to be possible today.

[1498] Naturally I have no explanation to offer concerning such phenomena as the fast of Brother Klaus, but I am inclined to think it should be sought in the realm of parapsychology. I myself was present at the investigation of a medium who manifested physical phenomena. An electrical engineer measured the degree of ionization of the atmosphere in the immediate vicinity of the medium. The figures were everywhere normal except at one point on the right side of the thorax, where the ionization was about sixty times the normal. At this point, when the (parapsychological) phenomena were in progress, there was an emission of ectoplasm capable of acting at a distance. If such things can occur, then it is also conceivable that persons in the vicinity of the medium might act as a source of ions—in other words, nourishment might be effected by the passage of living molecules of albumen from one body to another. In this connection it should be mentioned that in parapsychological experiments decreases of weight up to several kilograms have been observed during the (physical) phenomena, in the case both of the medium and of some of the participants, who were all sitting on scales. This seems to me to offer a possible approach to an explanation. Unfortunately these things have been far too little investigated at present. This is a task for the future.

CONCERNING “ANSWER TO JOB”¹

[1498a] This is not a “scientific” book but a personal confrontation with the traditional Christian world view, occasioned by the impact of the new dogma of the Assumption. It echoes the reflections of a physician and theological layman, who had to find the answers to many questions on religious matters and was thus compelled to wrestle with the meaning of religious ideas from his particular, non-confessional standpoint. In addition, the questions were motivated by contemporary events: falsehood, injustice, slavery, and mass murder engulfed not only major parts of Europe but continue to prevail in vast areas of the world. What has a benevolent and almighty God to say to these problems? This desperate question, asked a thousand times, is the concern of this book.

RELIGION AND PSYCHOLOGY: A REPLY TO MARTIN BUBER¹

[1499] Some while ago the readers of your magazine were given the opportunity to read a posthumous article by Count Keyserling,² in which I was characterized as “unspiritual.” Now, in your last issue, I find an article by Martin Buber³ which is likewise concerned with my classification. I am indebted to his pronouncements at least in so far as they raise me out of the condition of unspirituality, in which Count Keyserling saw fit to present me to the German public, into the sphere of spirituality, even though it be the spirituality of early Christian Gnosticism, which has always been looked at askance by theologians. Funnily enough this opinion of Buber’s coincides with another utterance from an authoritative theological source accusing me of agnosticism—the exact opposite of Gnosticism.

[1500] Now when opinions about the same subject differ so widely, there is in my view ground for the suspicion that none of them is correct, and that there has been a misunderstanding. Why is so much attention devoted to the question of whether I am a Gnostic or an agnostic? Why is it not simply stated that I am a psychiatrist whose prime concern is to record and interpret his empirical material? I try to investigate facts and make them more generally comprehensible. My critics have no right to slur over this in order to attack individual statements taken out of context.

[1501] To support his diagnosis Buber even resorts to a sin of my youth, committed nearly forty years ago, which consists in my once having perpetrated a poem.⁴ In this poem I expressed a number of psychological *aperçus* in “Gnostic” style, because I was then studying the Gnostics with enthusiasm. My enthusiasm arose from the discovery that they were apparently the first thinkers to concern themselves (after their fashion) with the contents of the collective unconscious. I had the poem printed under a pseudonym and gave a few copies to friends, little dreaming that it would one day bear witness against me as a heretic.

[1502] I would like to point out to my critic that I have in my time been regarded not only as a Gnostic and its opposite, but also as a theist and an atheist, a mystic and a materialist. In this concert of contending opinions I do not wish to lay too much stress on what I consider myself to be, but will quote a judgment from a leading article in the *British Medical Journal* (9 February 1952), a source that would seem to be above suspicion. “Facts first and theories later is the keynote of Jung’s work. He is an empiricist first and last.” This view meets with my approval.

[1503] Anyone who does not know my work will certainly ask himself how it is that so many contrary opinions can be held about one and the same subject. The answer to

this is that they are all thought up by “metaphysicians,” that is, by people who for one reason or another think they know about unknowable things in the Beyond. I have never ventured to declare that such things do *not* exist; but neither have I ventured to suppose that any statement of mine could in any way touch them or even represent them correctly. I very much doubt whether our conception of a thing is identical with the nature of the thing itself, and this for very obvious scientific reasons.

[1504] But since views and opinions about metaphysical or religious subjects play a very great role in empirical psychology,⁵ I am obliged for practical reasons to work with concepts corresponding to them. In so doing I am aware that I am dealing with anthropomorphic ideas and not with actual gods and angels, although, thanks to their specific energy, such (archetypal) images behave so autonomously that one could describe them metaphorically as “psychic daimonia.” The fact that they are autonomous should be taken very seriously; first, from the theoretical standpoint, because it explains the dissociability of the psyche as well as actual dissociation, and second, from the practical one, because it forms the basis for a dialectical discussion between the ego and the unconscious, which is one of the mainstays of the psychotherapeutic method. Anyone who has any knowledge of the structure of a neurosis will be aware that the pathogenic conflict arises from the counterposition of the unconscious relative to consciousness. The so-called “forces of the unconscious” are not intellectual concepts that can be arbitrarily manipulated, but dangerous antagonists which can, among other things, work frightful devastation in the economy of the personality. They are everything one could wish for or fear in a psychic “Thou.” The layman naturally thinks he is the victim of some obscure organic disease; but the theologian, who suspects it is the devil’s work, is appreciably nearer to the psychological truth.

[1505] I am afraid that Buber, having no psychiatric experience, fails to understand what I mean by the “reality of the psyche” and by the dialectical process of individuation. The fact is that the ego is confronted with psychic powers which from ancient times have borne sacred names, and because of these they have always been identified with metaphysical beings. Analysis of the unconscious has long since demonstrated the existence of these powers in the form of archetypal images which, be it noted, *are not identical with the corresponding intellectual concepts*. One can, of course, believe that the concepts of the conscious mind are, through the inspiration of the Holy Ghost, direct and correct representations of their metaphysical referent. But this conviction is possible only for one who already possesses the gift of faith. Unfortunately I cannot boast of this possession, for which reason I do not imagine that when I say something about an archangel I have thereby confirmed that a metaphysical fact. I have merely expressed an opinion about something that can be experienced, that is, about one of the very palpable “powers of the unconscious”.

These powers are numinous “types”—unconscious contents, processes, and dynamisms—and such types are, if one may so express it, immanent-transcendent. Since my sole means of cognition is experience I may not overstep its boundaries, and cannot therefore pretend to myself that my description coincides with the portrait of a real metaphysical archangel. What I have described is a psychic factor only, but one which exerts a considerable influence on the conscious mind. Thanks to its autonomy, it forms the counterposition to the subjective ego because it is a piece of the *objective psyche*. It can therefore be designated as a “Thou.” For me its reality is amply attested by the truly diabolical deeds of our time: the six million murdered Jews, the uncounted victims of the slave labour camps in Russia, as well as the invention of the atom bomb, to name but a few examples of the darker side. But I have also seen the other side which can be expressed by the words beauty, goodness, wisdom, grace. These experiences of the depths and heights of human nature justify the metaphorical use of the term “daimon.”

[1506] It should not be overlooked that what I am concerned with are psychic phenomena which can be proved empirically to be the bases of metaphysical concepts, and that when, for example, I speak of “God” I am unable to refer to anything beyond these demonstrable psychic models which, we have to admit, have shown themselves to be devastatingly real. To anyone who finds their reality incredible I would recommend a reflective tour through a lunatic asylum.

[1507] The “reality of the psyche” is my working hypothesis, and my principal activity consists in collecting factual material to describe and explain it. I have set up neither a system nor a general theory, but have merely formulated auxiliary concepts to serve me as tools, as is customary in every branch of science. If Buber misunderstands my empiricism as Gnosticism, it is up to him to prove that the facts I describe are nothing but inventions. If he should succeed in proving this with empirical material, then indeed I am a Gnostic. But in that case he will find himself in the uncomfortable position of having to dismiss all religious experiences as self-deception. Meanwhile I am of the opinion that Buber’s judgment has been led astray. This seems especially evident in his apparent inability to understand how an “autonomous psychic content” like the God-image can burst upon the ego, and that such a confrontation is a living experience. It is certainly not the task of an empirical science to establish how far such a psychic content is dependent on and determined by the existence of a metaphysical deity. That is the concern of theology, revelation, and faith. My critic does not seem to realize that when he himself talks about God, his statements are dependent firstly on his conscious and then on his unconscious assumptions. Of *which* metaphysical deity he is speaking I do not know. If he is an orthodox Jew he is speaking of a God to whom the incarnation in the year 1 has not yet been revealed. If he is a Christian, then his deity knows about the incarnation of which Yahweh still

shows no sign. I do not doubt his conviction that he stands in a living relationship to a divine Thou, but now as before I am of the opinion that this relationship is primarily to an autonomous psychic content which is defined in one way by him and in another by the Pope. Consequently I do not permit myself the least judgment as to whether and to what extent it has pleased a metaphysical deity to reveal himself to the devout Jew as he was before the incarnation, to the Church Fathers as the Trinity, to the Protestants as the one and only Saviour without co-redemptrix, and to the present Pope as a Saviour with co-redemptrix. Nor should one doubt that the devotees of other faiths, including Islam, Buddhism, Hinduism, and so on, have the same living relationship to “God,” or to Nirvana and Tao, as Buber has to the God-concept peculiar to himself.

[1508] It is remarkable that he takes exception to my statement that God cannot exist apart from man and regards it as a transcendental assertion. Yet I say expressly that everything asserted about “God” is a human statement, in other words a psychological one. For surely the image we have or make for ourselves of God is never detached from man? Can Buber show me where, apart from man, God has made an image of himself? How can such a thing be substantiated and by whom? Here, just for once, and as an exception, I shall indulge in transcendental speculation and even in “poetry”: God has indeed made an inconceivably sublime and mysteriously contradictory image of himself, without the help of man, and implanted it in man’s unconscious as an archetype, an *ἀρχέτυπον φῶς*, archetypal light: not in order that theologians of all times and places should be at one another’s throats, but in order that the unpretentious man might glimpse an image, in the stillness of his soul, that is akin to him and is wrought of his own psychic substance. This image contains everything he will ever imagine concerning his gods or concerning the ground of his psyche.

[1509] This archetype, whose existence is attested not only by ethnology but by the psychic experience of individuals, satisfies me completely. It is so humanly close and yet so strange and “other”; also, like all archetypes, it possesses the utmost determinative power with which it is absolutely necessary that we come to terms. The dialectical relationship to the autonomous contents of the collective unconscious is therefore, as I have said, an essential part of therapy.

[1510] Buber is mistaken in thinking that I start with a “fundamentally Gnostic viewpoint” and then proceed to “elaborate” metaphysical assertions. One should not misconstrue the findings of empiricism as philosophical premises, for they are not obtained by deduction but from clinical and factual material. I would recommend him to read some autobiographies of the mentally ill, such as John Custance’s *Wisdom, Madness and Folly* (1951), or D. P. Schreber’s *Memoirs of My Nervous Illness* (first published 1903), which certainly do not proceed from Gnostic

hypotheses any more than I do; or he might try an analysis of mythological material, such as the excellent work of Dr. Erich Neumann, his neighbour in Tel Aviv: *Amor and Psyche* (1952). My contention that the products of the unconscious are analogous and related to certain metaphysical ideas is founded on my professional experience. In this connection I would point out that I know quite a number of influential theologians, Catholics as well as Protestants, who have no difficulty in grasping my empirical standpoint. I therefore see no reason why I should take my method of exposition to be quite so misleading as Buber would have us believe.

[1511] There is one misunderstanding which I would like to mention here because it comes up so often. This is the curious assumption that when a projection is withdrawn nothing more of the object remains. When I correct my mistaken opinion of a man I have not negated him and caused him to vanish; on the contrary, I see him more nearly as he is, and this can only benefit the relationship. So if I hold the view that all statements about God have their origin in the psyche and must therefore be distinguished from God as a metaphysical being, this is neither to deny God nor to put man in God's place. I frankly confess that it goes against the grain with me to think that the metaphysical God himself is speaking through everyone who quotes the Bible or ventilates his religious opinions. Faith is certainly a splendid thing if one has it, and knowledge by faith is perhaps more perfect than anything we can produce with our laboured and wheezing empiricism. The edifice of Christian dogma, for instance, undoubtedly stands on a much higher level than the somewhat wild "philosophoumena" of the Gnostics. Dogmas are spiritual structures of supreme beauty, and they possess a wonderful meaning which I have sought to fathom in my fashion. Compared with them our scientific endeavors to devise models of the objective psyche are unsightly in the extreme. They are bound to earth and reality, full of contradictions, incomplete, logically and aesthetically unsatisfying. The empirical concepts of science and particularly of medical psychology do not proceed from neat and seemly principles of thought, but are the outcome of our daily labours in the sloughs of ordinary human existence and human pain. They are essentially irrational, and the philosopher who criticizes them as though they were philosophical concepts tilts against windmills and gets into the greatest difficulties, as Buber does with the concept of the self. Empirical concepts are names for existing complexes of facts. Considering the fearful paradoxicality of human existence, it is quite understandable that the unconscious contains an equally paradoxical God-image which will not square at all with the beauty, sublimity, and purity of the dogmatic concept of God. The God of Job and of the 89th Psalm is clearly a bit closer to reality, and his behaviour does not fit in badly with the God-image in the unconscious. Of course this image, with its Anthropos symbolism, lends support to the idea of the incarnation. I do not feel responsible for the fact that the history of

dogma has made some progress since the days of the Old Testament. This is not to preach a new religion, for to do that I would have to follow the old-established custom of appealing to a divine revelation. I am essentially a physician, whose business is with the sickness of man and his times, and with remedies that are as real as the suffering. Not only Buber, but every theologian who baulks at my odious psychology is at liberty to heal my patients with the word of God. I would welcome this experiment with open arms. But since the ecclesiastical cure of souls does not always produce the desired results, we doctors must do what we can, and at present we have no better standby than that modest “gnosis” which the empirical method gives us. Or have any of my critics better advice to offer?

[1512] As a doctor one finds oneself in an awkward position, because unfortunately one can accomplish nothing with that little word “ought.” We cannot demand of our patients a faith which they reject because they do not understand it, or which does not suit them even though we may hold it ourselves. We have to rely on the curative powers inherent in the patient’s own nature, regardless of whether the ideas that emerge agree with any known creed or philosophy. My empirical material seems to include a bit of everything—it is an assortment of primitive, Western, and Oriental ideas. There is scarcely any myth whose echoes are not heard, nor any heresy that has not contributed an occasional oddity. The deeper, collective layers of the human psyche must surely be of a like nature. Intellectuals and rationalists, happy in their established beliefs, will no doubt be horrified by this and will accuse me of reckless eclecticism, as though I had somehow invented the facts of man’s nature and mental history and had compounded out of them a repulsive theosophical brew. Those who possess faith or prefer to talk like philosophers do not, of course, need to wrestle with the facts, but a doctor is not at liberty to dodge the grim realities of human nature.

[1513] It is inevitable that the adherents of traditional religious systems should find my formulations hard to understand. A Gnostic would not be at all pleased with me, but would reproach me for having no cosmogony and for the cluelessness of my gnosis in regard to the happenings in the Pleroma. A Buddhist would complain that I was deluded by Maya, and a Taoist that I was too complicated. As for an orthodox Christian, he can hardly do otherwise than deplore the nonchalance and lack of respect with which I navigate through the empyrean of dogmatic ideas. I must, however, once more beg my unmerciful critics to remember that I start from *facts* for which I seek an interpretation.

ADDRESS AT THE PRESENTATION OF THE JUNG CODEX¹

Mr. President, viri magnifici, Ladies and Gentlemen!

[1514] It gives me much pleasure to accept this precious gift in the name of our Institute. For this I thank you, and also for the surprising and undeserved honour you have done me in baptising the Codex with my name. I would like to thank Dr. Meier personally for his persistent and successful efforts to acquire the Codex, and for organizing this celebration. He has asked me to say something about the psychological significance of Gnostic texts.
